Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

NEW YORK.—There is a steady but moderate demand for comb honey, and enough stock seems to be arriving to supply the demand. Prices remain as our previous quotations. Extracted honey is in fair demand, prices ruling from 5½¢ to 6½¢, according to the quality.

FRANCIS H. LEGGETT & Co.,
Dec. 24. Franklin and Varick Sts., New York.

CHICAGO.—The honey market is of a slow nature, with little change in price of any of the grades. Choice grades of white comb honey, 14½¢@15; good to No. 1, 13½¢@14; light amber, 12½¢@13; dark grades, including buckwheat, 10¢@12. Extracted white, 5½¢@7; amber, 5½¢@5½¢; dark, 5¢@5½¢. The scale of prices varying according to flavor, body, and package. Beeswax steady at 28.

R. A. BURNETT & Co.,
Dec. 21. 199 South Water St., Chicago, Ill.

NEW YORK.—Comb and extracted honey market quiet. Quoting same as follows: Fancy white, 15¢@16; A No. 1 white, 14¢@15; No. 1 white, 13¢@14; No. 2, 11¢@12; fancy buckwheat, 10¢@11; No. 1 buckwheat, 10¢@11; No. 2 buckwheat, 9¢@10; white clover and basswood extracted, 6½¢@7; light amber, 6¢@6½; amber and buckwheat, 5½¢@6. Beeswax—fancy, 29¢@30; good average, 27¢@28. Market quiet.

CHAS. ISRAEL & BROS.,
Dec. 23. 486-490 Canal St., New York City, N. Y.

DETROIT.—Fancy white comb honey, 15; No. 1, 14; dark and amber, 11¢@13; extracted, white, 7¢@7½; dark and amber, 5¢@6½; beeswax, 26¢@27.

M. H. HUNT & SON,
Oct. 21. Bell Branch, Mich.

SCHENECTADY.—As is usually the case, we are having a very quiet market after the holidays, but we look for greater activity soon, especially in buckwheat extracted, which is really quite scarce. No change to note in prices of comb honey.

CHAS. McCULLOCH,
1 Eagle St., Schenectady, N. Y.

SAN FRANCISCO.—Comb honey, 10¢@12½; extracted, water white, 5¢@6; light amber, 4½¢@5½; dark, 3½¢@4½. Beeswax, 26¢@28. Odd lots are about cleaned up, prices stiffening in consequence.

Dec. 17. E. H. SCHAEFFLE, Murphys, Calif.

WANTED.—Comb honey in Danz. sections. Write, stating quality and price.

THE A. I. ROOT Co., Medina, Ohio.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.

EVANS & TURNER,
Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity.

R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.

SEAVEY & FLARSHHEIM,
1318-1324 Union Avenue, Kansas City, Mo.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.

WM. MORRIS, Las Animas, Col.

FOR SALE.—10,000 lbs. light-amber alfalfa extracted honey in 75-lb. cans, at 5¢ a pound.

R. T. STINNETT, Mesilla Park, N. M.

FOR SALE. Extracted honey, from alfalfa, at 7¢ per pound. Send for sample.

D. S. JENKINS, Las Animas, Col.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans.

B. WALKER, Clyde, Ill.

1200 FERRETS. All sizes; some trained; first-class stock. New price list free.

N. A. KNAPP, Rochester, Lorain Co., Ohio.

CHAS. ISRAEL & BROS.,

486-490 Canal St., Corner Watt St., N. Y.

*These prices are not the publishers' prices for these papers, but they are our special reduced prices when taken in connection with GLEANINGS. In many cases they are just one-half the regular rate.

How to get the Price for any or all of the Papers Named Above:

1. Gleanings in Bee Culture, one year, \$1.00.
2. If you want only one additional paper, add the price found in the top of the column in which that paper appears.
3. If you want several papers in addition to Gleanings, each one may be had at the price named at the top of the column. For instance: Gleanings, S. S. Times, (3rd col.) and Rural New-Yorker (3rd col.), will cost you \$2.50.
4. You may select as many papers from each column as you wish.
5. Every order sent us must include Gleanings.
6. Foreign postage extra.
7. We will send all papers or pen to one or separate addresses as desired.

CONDITIONS.—Offers are subject to withdrawal at any time. Subscriptions to the Review of Reviews, Youth's Companion, Current Literature, and N. E. Magazine must be strictly new. Neither the Review of Reviews nor Post Fountain Pen will be sent in any combination amounting to less than \$2.50.

THE A. I. ROOT COMPANY, MEDINA, O.

Gleanings in Bee Culture

[Established in 1873.]

Devoted to Bees, Honey, and Home Interests.

ROOT'S GOODS
AT
ROOT'S PRICES.

C. H. W. Weber, Cincinnati, Ohio.

2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1902 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

GLEANINGS

A JOURNAL DEVOTED TO BEES AND MONEY AND HOME INTERESTS.

BEE CULTURE

ILLUSTRATED SEMI-MONTHLY
Published by THE A. I. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXX.

JAN. 1, 1902

No. 1.

MEDINA is the name of the postoffice of the editor of *Australian Bee-keepers' Review*—in honor of A. I. Root. [In behalf of A. I. Root, my father, I extend my most grateful acknowledgments.—ED.]

THAT REPORT on p. 976, as there said, "does not prove that the gathering was in proportion to the length of tongue." Neither does it prove that in general gathering is not in proportion to length of tongue, and especially to reach of tongue.

J. W. ROUSE says in *Progressive*: "We somewhat doubt if queen-bees can be made to hatch, at least in our climate and conditions, in less time than 15½ days." They do it here, friend Rouse. Suppose you try some eggs whose age you know for certain, have a queen reared from one of them in a full colony, and then tell us just how long it takes.

THE REPORT of the International bee convention held in Paris in 1900 is a volume of 265 octavo pages. Our own Camille took a prominent part, and had a salvo of applause upon first rising. Modestly he took that as honoring Charles Dadant, his father. [That is just like the younger Dadant; and yet how many sons of their fathers but what would have taken the honor as meant for themselves?—ED.]

THE USE of carbolineum on hives is not encouraged in *Muenchener Bienenzeitung*, on the ground that it affects the flavor of the honey. [Those who have tested the same preservative in this country have made a similar objection. About the only use we can make of it in bee culture is in applying it to bottom-boards or hive-stands. The very fact that railroad companies use it for ties goes to show that it must be a good preservative.—ED.]

THE LATEST uncapping-device recommended in foreign journals is a lamp such as gas-fitters use. It quickly melts the cap-

pings so they shrink away to the cell wall, and no cappings need be strained out of the honey. Looks worth trying. [There may be something in this. Yes, I know it would work; but would it not burn the wax, and so taint the honey? I should feel very sure it would.—ED.]

WE'VE BEEN promising ourselves great things if we could only control fertilization. Now comes Adrian Getaz, in *American Bee Journal*, indorsed by F. B. Simpson, in the *Review*, asking, "If we could breed from an individual drone of our choice, how could we tell that this drone would give better workers than that one?" [That is true; but if we could somehow control the mating of our queens so that they would meet a drone from some choice colony, the chances would be that we could improve our stock.—ED.]

S. E. MILLER says, p. 974, "The advertiser has, of course, a right to say what he likes in the space which he pays for, provided he uses no bad language." My good friend of the floury name, I hardly think you meant just that. No advertiser has a right to say what is not true. More than that, no publisher has a right to accept an advertisement, at any price, if he knows it to be untrue. [You are correct; and, however imperfectly it may have been done in the past, we attempt to carry out that rule in GLEANINGS.—ED.]

IN SPITE of some sittings-down-upon I can not entirely get rid of the idea that measuring live tongues with a glossometer may be more satisfactory than measuring dead tongues with a rule. The rule tells what a bee can do: does it tell what it will do? The glossometer tells what it will do, or, if you please, what it does do. [There may be something in this. Outward physical appearance or measurements often give a wrong impression. A man may be six feet high, and one mass of muscles, apparently, but may be no match in strength for a shorter and lighter man.—ED.]

YOU ARE RIGHT, Mr. Editor, in your defense of the mountains, p. 972, and I must confess that the credit side of their account

is the larger. We had a drouth here last summer that we couldn't fight, for no friendly mountain was nigh as a reservoir of moisture. The mountains make the drouth, but they are always ready to give back the moisture, with special advantages, as you mention. G. Stull, that brother-in-law of mine in whom your father was interested as the raiser of such fine strawberries, has gone to spend the winter in Phoenix, Ariz.; that or death, said the doctors; and it may be he will owe his life to those same mountains. My apologies herewith, Mr. Editor.

AN INTERESTING table of tongue-measurements by Prof. Gillette is given in *Am. Bee Journal*. It seems there is no fixed relation between total length of tongue and tongue reach. In one lot of blacks the total length was uniformly .24 inch, while the tongue reach, instead of being uniform, varied from .16 to .19. Bro. Doolittle, please give us tongue reach of those bees reported on p. 976. Prof. Gillette seems a bit suspicious that bees get only pollen from red clover, seeing that the tubes measured from .34 to .37, while the greatest tongue reach he found was .23. But I think there has been much reliable testimony that red-clover honey has been obtained. [See editorials elsewhere.—ED.]

SPORTS OR FREAKS among animals have also been the basis of new types, although in animal life the new type may take longer to establish than in plant life. But with the right kind of freak it doesn't require a long lifetime with any thing which produces so many generations in a season as the bee. We are told that a single freak sheep properly used produced an entirely new breed of sheep. A single freak queen ought in much less time produce a somewhat similar result. I don't believe it will take any three lifetimes, nor any three years, to make a long stride ahead, if we all keep our eyes wide open for the right kind of sports, and then make the right use of them. [See answer to another Straw in this issue.—ED.]

THAT TALL SECTION, p. 981, looks larger than the other, and it is larger—has 11 per cent more surface. Costs 11 per cent more for full foundation too. [Exactly. In one way it is larger, and in another it is not. In superficial surface or cappings of comb face, one has a larger area; in actual weight they are both the same. Now, the question is, "Would it cost any more to produce one section than another?" So far as the wood of the sections is concerned, the two are the same price. If the tall one sells for one cent more, and the foundation in it costs 11 per cent more, there is still a large gain on the credit side for the box with the large surface. Assuming that the foundation costs 11 per cent more, then it would make, as I figure it, only $\frac{1}{30}$ of one cent more; or a credit, assuming that the section brings one cent more on the market, of $\frac{2}{3}$ of a cent. Or, if it sold for two cents more in the open market, there would be a credit of $1\frac{2}{3}$ of a cent. So, taking it all in

all, the mere difference in superficial surface of the foundation doesn't cut any figure.—ED.]

THERE YOU GO again, still on a side track, Mr. Editor, p. 971. Let's get back on the main track and begin all over again. We were talking about the least that could be expected in the worst year, and I said I would be satisfied if I could be sure of at least \$1 a colony. You ask if I have data handy. Yes, my worst year was an utter failure of the crop, and a ton of granulated sugar fed. That was a good deal less than \$1 a colony. Other years I've had more than \$10 a colony, but that has nothing whatever to do with the case. Now let's keep on the main track, and say whether you think it a conservative estimate to say that in any year the yield will never be less than \$5 a colony. [Perhaps I have been on a side track. If so, I stand corrected. No, I don't think we can go so far as to say that the income in any year will never be less than \$5.00 a colony. What I had in mind was an average, taking in a period of ten or fifteen years.—ED.]

A WILD STATEMENT is going the rounds of the European bee-journals, the last one I've seen it in being *Le Rucher Belge*, a really excellent journal. In that it is said in all seriousness that Mr. Root, the well-known American bee-keeper, has succeeded in obtaining long-tongued bees of such excellence that, notwithstanding the high price at which Mr. Root sells them, \$200 apiece, he has not been able to supply the demand, and has been obliged to start an additional queen-rearing establishment in Texas to help out! Now, I wonder how many of our foreign friends will make the proper correction by saying that The A. I. Root Co. merely valued one queen (that was never offered for sale) at \$200, and never sold a queen for more than \$10.00. [It is evident that some of our friends across the water see through a glass darkly. That is to say, they have acquired only a smattering of English, and a very poor smattering at that, with the result that they do not read aright. Whew! if we could sell queens for \$200 a piece, and not supply the demand, we would go out of the supply business instantaneously.—ED.]

A CORRESPONDENT who does not court publicity is very emphatic in the belief that "whenever and wherever you find extremely light color, or more than the three bands, there is black blood every time." Unreasonable as that may look, he seems to have some proof for his belief, and I must confess that, in the early years of Italianizing, while there was a constant tendency toward black blood there was also a tendency, more or less constant, toward lighter-colored queens. [A good many have not understood why we of the Root Co. have favored the importation of queens direct from Italy, arguing that home-bred American queens were better than the inferior-looking stock from Italy. The trouble with many of our

American queens is that they have had bred into them light color, and along with it some other undesirable traits. The queens from Italy direct have a certain fixed type—a fixity that has come about through centuries of environment in the one locality—the Mediterranean on one side and the Alps on the other. I do not wish to say any thing against American home-bred queens; but I do believe that we should use as a basis, or groundwork, for our improved Italian stock, queens direct from Italy.—ED.]

YOU ASK ME, Mr. Editor, if I don't think "it sounds better to say the sun *sets* than *sits*," p. 972. Most assuredly. I am not in the habit of objecting to grammatical expressions, and "the sun *sets*" is grammatical, supported by the dictionary. I was talking about *ungrammatical* expressions. Do you know of any grammar or dictionary that will support *shook* as an adjective or a participle? Do you know of any reputable writer, outside of the case to which I objected, who has ever so used it? Honor bright, yourself. [I am well aware the present usage and the dictionaries now authorize the transitive verb *set* when applying to the sun going below the horizon; but it is ungrammatical, just the same, or at least was in the early usage of the language, for you know you can not, grammatically speaking, *set* down in a chair, but you may *sit*. The point I tried to make was, that if you were going to reform what is strictly ungrammatical you ought to make war on those words and phrases that have crept into our language that are not grammatical, strictly speaking, but which are now accepted as good usage.—ED.]

C. P. DADANT gives this bright reply to those who say section honey is manufactured by machinery: "If it were machine-made it would be all alike. There might be a dozen different patterns, but all made by the same pattern would be *exactly* alike. Now compare any number of sections; look at the position of the different pop-holes and other irregularities, and you will find that, like the leaves on a tree, although there is a general resemblance no two will ever be found exactly alike. Until you can find at least two sections exactly alike, please give the bees credit for their handiwork." [This is a good point. It is an unanswerable argument showing that comb honey is not manufactured, as has been so persistently stated in the newspapers. If dies *could* be made at all for molding the faces of the comb, they would be so very expensive that probably not more than one or two die-faces could be afforded; and yet, as Dadant says, no two sections will ever be found exactly alike. Some may be similar, but just enough different to show that it is bee work and not man work. I suggest that those of our friends who are engaged in refuting these lies that are now being circulated broadcast use this argument of Mr. Dadant's, as well as the other argument of a \$1000 reward for a single sample

of manufactured comb honey that can not be detected from the genuine. These two would afford good proof.—ED.]

RATHER DISCOURAGING is the outlook for improvement according to what is said p. 974. It is true that some improvements have required generations, as mentioned. But there's another side. *Some* of the improvements have been compassed in a year. Within 12 miles of here lives a man who lately gave \$1750 for a single carnation plant. It is hardly likely that a lifetime was spent on that plant. Agrippina is a rose of low growth. One day Rev. James Sprunt found a branch of an agrippina shooting away above the rest. That's about all the time it took him to produce a new climbing rose, the James Sprunt. One day a white rose was found growing on a branch of the pink rose Catharine Mermet, and from this sport, as it is called, was at once established the beautiful white rose the Bride. Many other new varieties have come from sports. [You are right. The case of an insect and that of an animal, so far as the element of time is concerned, is not alike. Of queen-bees we may be able to get several generations in a season; of cattle, for example, not more than one in a year. Then it is true that a "sport" sometimes will reach away in beyond the characteristics of the parent stock.—ED.]

E. E. HASTY, in his delightful department in the *American Bee Journal*, "The Afterthought," seems much pleased with Mr. A. D. D. Wood's "infallible" plan of queen introduction, as follows: Remove the old queen, take out of the cage all the attendant workers, "and lift a frame from the hive and put into the cage from 15 to 20 *young* bees from one hour to one day old, being doubly sure there are no old bees put into the cage. Remove the cork or cardboard, and in 24 to 48 hours the queen will be liberated and laying." It will also work with any colony that has been queenless not more than four days. [I believe there is a good deal in this. That man Hasty always did have an eye for the practical. It has been often said, with a good deal of truth, that the attendant bees with a queen are the ones that cause trouble in introduction. Some little time ago it was recommended to remove all such and then introduce. But Mr. Wood has gone one step further by putting young bees, that have the same scent as the colony, in with the queen. It certainly looks as if it were all right. Unfortunately the plan would not be one, however, that could be used by beginners. They would not know how to get the bees out of the cage, and still keep the queen in; and much less would they be able, with their inexperienced fingers, to pick up bees and cage them, even if they could always tell young bees. So I suppose the directions that ordinarily go out with mailing-cages had better be left as they are. But the experienced beekeeper, when he has a valuable queen to

introduce, would do well to follow the Wood plan. I should not, however, consider it infallible, for I do not believe *any method* will ever be devised that would invariably introduce successfully queens to all kinds of colonies.—ED.]

AMERICAN BEE JOURNAL.

Concerning the adulteration of comb honey, Mr. York well says :

That hoary lie about the adulteration of comb honey seems still to retain much vigor. Here is a sample of its cat like vitality :

"On my vacation in Michigan last summer I got some real honey—the real sweet kind, with a comb that chews up beeswaxy. It was so good that for three months after I came back I tried to get, in Chicago, some honey, but I could not find it. Of course, every grocery store had what it said was strictly pure honey. In the nicest-looking combs — too nice looking; it was plain that it was all manufactured. A few days ago my grocer told me he had some real honey this time. I was certain of that, too, as soon as I saw it. I have worked with bees and know the ear-marks of their handiwork, and that comb was just irregular enough, imperfect enough in places to fool me. I bought two pounds. And when I got it home and took a mouthful the honey was not very sweet—it was a poor grade of glucose; and the comb melted in my mouth—it was paraffine."

No fading away of vigor about that, is there? Indeed, it has gained a robustness that exceeds its former self; for in former stages it only claimed that a minor part of the comb honey in Chicago was adulterated; now there is none of the genuine to be found in Chicago, although it be sought carefully for three months!

The amazing part about it is that this vigorous slander is not found in some obscure place, spoken by some ignoramus in the country grocery at the cross-roads, but it is an opinion delivered in all seriousness before a body of supposedly brainy men. It is an extract from a paper read by the proprietor of the *Farmer's Call*, at the annual meeting of the National Agricultural Press League, and published in that sprightly periodical, *Agricultural Advertising*, published by Frank B. White Co. Mr. Frank B. White is well known as a man of untarnished reputation, and the soul of honor. Taken all together, after so many years of battling with a great wrong, bee-keepers may be excused for feeling just a little discouraged as to getting anything like a semblance of justice.

More may be said of this hereafter.

These base falsehoods on the in-Stahlment plan seem to have originated from a party in Quincy, Ill., who had spraying-outfits for sale, and advertised them in the bee-journals. He advised spraying trees in bloom; and when he was debarred from further opportunity of doing evil he turned his guns on bee-keepers as above. That such ill-meaning men should be able to get a hearing before such a body of men leads one to think that the latter are not up to mediocrity in intelligence.

Mr. E. T. Abbott, in the *Busy Bee*, handles this matter in a manner highly gratifying. Here is one extract :

Think of a man who knows enough to edit the Monthly Blatter, of Scrogsville, to say nothing of an up-to-date agricultural paper, getting off this stale, dead, rotten, and long since buried slander on honey, before a lot of intelligent agricultural editors and pub-

lishers. Why! the very thought of it should drive him to sack-cloth and ashes, and an abject apology to the whole bee fraternity.

BRITISH BEE JOURNAL.

Concerning Mr. Dzierzon's connection with the invention of movable frames, Mr. A. Royds, of Soberton, England, says :

The recent interesting articles by Mr. R. Hamlyn-Harris on the "Biology of the Honey-bee" contain a reference to movable-frame hives in connection with the renowned name of Dzierzon that may be the cause of a certain degree of misconception. Very recently I had the privilege of reading Dzierzon's work, "Rational Bee-keeping," in the translation published in 1882 by Mr. C. N. Abbott, from the then latest German edition of 1878 by H. Dieck. The hives which Dzierzon there describes and recommends are not in any correct sense movable-frame hives, but rather adaptations of the old bar hive which had been known in England since about the middle of the eighteenth century. Although described as "movable," the combs are not so in the sense now understood, as they had to be cut away from the sides of the hive before they could be taken out. Moreover, as the hives were made to open at the ends, it was possible to reach any interior comb only by the formidable process of cutting away all those in front of it. The feature, indeed, most likely to impress a present-day bee-keeper on reading the work is the utter lack of prescience exhibited by so skilled an apiarian and keen investigator as Dzierzon in regard to the use of both movable frames and comb foundation. The latter, in particular, he dismisses as hardly worthy of practical consideration, while the former fare but little better at his hands.

I am not aware that he ever modified his views on these subjects; but, as movable frames had been perfected by both Langstroth and Baron von Berlepsch some twenty-seven years prior to the date of the edition I have referred to, it is clear that credit does not belong to Dzierzon in this connection.

THE TROUBLES OF A FOUL-BROOD INSPECTOR.

New Laws Needed; War on Stationary Combs.

BY J. M. HAMBAUGH.

This is said to be a progressive age; and I believe that, in the general acceptance of the term, it is true; but when I travel over our beautiful country, with its rich nectar-producing resources, and scan the very crude condition of a great many apiaries of San Diego Co., I feel very much like questioning the truth of the above quotation. When I see so much of the go-as-you-please, haphazard, miscellaneous mixups of every description, it makes my heart fairly ache to realize the splendid opportunities being lost for the want of a little progress. In some instances we come to a progressive, wide-awake man, whose bees, hives, fixtures, and general surroundings indicate an apiarist of culture. His hives, lids, platforms, brood-frames, etc., are of exact pattern. All combs are movable throughout his entire yard, and he takes pleasure in guiding the inspector in his work from hive to hive, for he readily understands that the work of the latter is chiefly in his

interest, and to guard against the possible danger of "foul brood and other infectious diseases." His brother bee-keeper, but half a mile or so distant, however, is of the old primitive style. His bees "work for nothing and board themselves," and occupy a deserted rock pile or isolated nook, and when the task of inspecting is undertaken, "Oh, hokie! shade of our ancestors!" Here is a problem that is not problematic—combs crossed and re-crossed; right and left angles, half-moons, quarter cuts, and miscellaneous go-as-you-please brood-nest.

Foul brood, black brood, and all the diseases known in the category can fester and thrive in these old non-movable-comb hives, so far as the efforts of the inspectors are concerned, from observations that can be gained in the brood-chamber, and so the non-progressive slipshod bee-keeper can thus hug an adder, not only to sting himself, but also his neighbors, who are powerless to help themselves under existing conditions.

Now, I am sure, brother bee-keepers, the picture is not overdrawn, and I look upon it as an absolute necessity in behalf of the best interest of the careless bee-keeper, as well as the protection of the progressive apiarist, to enact a State law making it obligatory on each and every bee-keeper to put his bees upon movable combs, so that they may be accessible for investigation and manipulation. It would be doing no one an injustice, but instituting a righteous defense against the common enemy to the bee-keeping fraternity, and raising the industry to a higher degree of progress. I also believe it very essential that a law be passed compelling any one, under penalty of a fine, to obtain a certificate from a lawfully appointed inspector, certifying that his or her bees are healthy, and free from all infectious diseases, before he can be at liberty to move them from one locality to another; and when bees are imported from an adjoining State that has no laws of a like nature it should be the duty of the owner of said bees, under penalty of the law, to have at once said bees inspected.

And now, Mr. Editor, I desire to hear from you and all others interested in the bee-keeping pursuit. If we desire to progress, and protect ourselves against impending foes, we certainly should have laws that will defend us. It is said, "In counsel there is wisdom." Now let us have the counsel.

Richland, Cal.

[I believe I saw more slipshod bee-keeping, go-as-you-please "any old way" methods in California than in any other State I ever visited. In saying this I do

not mean to convey the impression that there are no up-to-date bee-keepers using modern methods there. We see the two extremes—the best and the poorest. One reason of this is that, when the seasons are so wonderfully productive, those who have the idea that "bees work for nothing and board themselves" are anxious to get some of this honey that "rains down as free as water;" and they see no reason why they can not do as well as their neighbors, but they never do.

Yes, in your State it would be a good idea to have a law to *compel* all persons who keep bees to put them in movable-frame hives; but such a law would hardly be needed in other States.—Ed.]

RAMBLE 196.

Foul Brood in California; Shaffner Bros.; E. R. Root's Visit; Jouncers.

BY RAMBLER.

Foul-brood inspection is practiced to quite an extent in Central California. Every county that is noted for bee-keeping has its inspector. Mr. Bowen is inspector for Fresno Co.; and when he has a real hard case of foul brood on hand he calls in the prominent bee-men of the vicinity and allows them to inspect with him; and, having their indorsement, he goes ahead to destroy. While Mr. Bowen is independent enough to take the most severe measures, these witnesses he calls in give him such a backing that there can be no cause for complaint.

LOOKING FOR FOUL BROOD.

There is, nevertheless, a faction of beekeepers in the county who believe the disease can be temporized with and eventually cured. Esq. Abbott is of this opinion, and he advises the quarantining of all foul-broody combs, extracting the honey and cut-

FIG. 1. RAMBLER'S JOUNCER FOR CLEANING SUPERS.

ting out diseased cells until the disease is cured. The extensive bee-men believe in heroic methods, and they think that the esquire might in time cure a colony of the disease; but the careless bee-keeper would not. Then there are a few instances where Mr. Bowen has been abused while in the performance of his duties, which, I suppose, is the common experience of foul-brood inspectors. There was a very bad case of foul brood in a small apiary of about 50 colonies near Selma, and Mr. Bowen called in a few men, as usual, in order to make his authority stronger. Mr. Stearns had an idea, and a correct one, that the Rambler would like to be on the board, and, with that good team of his, he trotted me over to Selma. Mr. Bowen had a strong backing in the persons of Mr. Stearns with his many hundred colonies, and Mr. Payne with many hundreds. Then there were four or five besides, with a varying number of colonies and experience. Mr. Bowen was armed with gauntlet gloves, veils, smoker,

and several prodding-wires. These were sharp-pointed, and were distributed among the board of examiners. If an examiner found a suspicious portion of brood the prodder was used. After prodding around among the disease the prodder was prodded into the ground a few times to remove all danger from the germs getting from the prodder to the man and from the man to his own bees, and that was a wise provision on the part of Mr. Bowen.

But the fun came in when we came across box hives with tops and bottoms more or less split, and nailed on with ten-penny nails.

Well, that bottom had to come off, and a slice of comb cut out and examined; but I protested that a little piece of brood was not enough, when some of the movable-frame hives had been examined and condemned when only a cell or two of the disease had been found. What if a cell or two should be hidden somewhere in that brood-nest? The board decided we could not tear all of

FIG. 2.—RAMBLER'S JOUNCER AND HOW IT GETS THE BEES.

the brood out without ruining the colony, therefore we passed it as good. I wish, however, to make a minority report that all such hives should be burned; for a bee-keeper who will tolerate such hives in his apiary ought to be burned—I mean the hive, of course, not the man. The photo shows the board at work, Mr. Payne pointing his finger at that square hole in the top of a box hive, and the inspector holding a piece of comb that had to be cut out. They are all deeply interested.

Well, I am now about to leave Central California; and before doing so I wish to note the fact that E. R. Root halted from his mad 6000-mile (more or less) rush, and made Mr. McCubbin and myself a visit. I was at the station to welcome our distinguished visitor; and of all the odd sorts that got off the train he was one of them. A big grip, three cameras, and a new-fangled tripod. Then our guest had been slinging ink at such a rate that his hands and face were more or less picturesque. Mr. McCubbin, with his old white horse, soon deposited him safely under his roof, where a scrubbing-up could be accomplished. I well remember what Bro. Hutchinson said about Editor Root and his affability as a leading characteristic; but there must be a mistake about it, for we found that his leading trait is the consumption of apricots. This excellent fruit was rich and ripe at that time; and every time a crate was placed in the room it would be emptied in no time. Mr. McCubbin informed me confidentially that he would keep ye editor supplied, even if it took a leg; and he was as good as his word. He always had a full crate to replace the empty one. Mr. McCubbin is now planning to plant a large apricot-orchard. He reasons that, if all of the Roots are such lovers of apricots, he would prepare to supply them by the carload; so, look out, Rootville.

I was greatly pestered by the editor's persistent habit of snapping his three kodaks at me. I am usually a sober fellow; but you must forgive me if I did smile a little while he was indulging in his habit.

Well, we had a happy time, didn't we, Mr. Editor? May your shadow never grow less. Remember, Mr. McCubbin will soon be raising apricots by the carload.

But the best of friends must part, and our happy incidents must close. The scenes must shift, and I find myself again in lovely Los Angeles.

The first consideration upon my return south was my own apiary. I had left it in charge of two young men, Arthur and Earl Shaffner. When we leave our goods and chattels in the hands of others it sometimes happens that said goods have a mysterious way of going to the bad; but I found the opposite condition in my apiary, and I could not help remarking, in Bible language, "Well done, good and faithful young men." I predict that the brothers will step up higher in the bee business. I regret that the aforesaid editor did not take time to

make their acquaintance, and examine¹ a modern up-to-date apiary.

One of the chief up-to-date appliances in my apiary is known as a jouncer, and it receives the unqualified approval of the brothers. Some four or five years ago I described, with pen and pencil, my first jouncer, and it was a very crude affair compared with the one in use at present. The photos show the device and how to use it. It will be observed that it is made very strong, made mostly of tough fir, and put together with bolts, and a cloth tray is adjusted under the hive to be jounced. When it is desired to jounce the bees from a super it is adjusted as in photo No. 1, and the whole jounced against the ground. The sudden jar, or a few of them, send the bees all into the tray. The latter can be removed as shown in Fig. No. 2, and the bees dumped on the top of the frames of the colony. In order to cushion the lower ends of the corner posts of the jouncer they are chamfered off to a point. As there are no stones in the apiary, when the jouncer strikes the ground the jounce is broken just enough to prevent the combs from breaking. Arthur Shaffner is operating the "masheen." The benefits derived from this method of getting bees off the combs are all in the line of rapid manipulation. In the *Amer. Bee Journal* not many months ago, Mr. Davenport caught on to this idea and applied it to the common L. hive. The best success, however, is attained with a shallow brood-chamber; and the only objection that the brothers and I have to it is, when there is much thin honey it slops out upon the bees; but, of course, it is best to wait until the honey is thick. It is very hard to make people believe that any new way is better than their way; but as my former good seed sown brought forth some good results, I sow again, and again watch results. Whether bee-keepers use the Rambler's jouncer or not, I hope the bee-keepers will discard the old obsolete use of a brush. Bees can be shaken off the combs clean enough. In Central California but few brushes are used.

I have great hopes for the shallow extracting-super. Mr. Davenport says the jouncing principle is worth \$50 a year to him, even with the standard frames. Now, I would give \$50 for a method that will enable me to extract a whole shallow super without removing the frames. Can it ever be done? is the query of the Rambler.

[I agree with you most heartily that it is not wise to temporize with foul brood. Cutting out here and there diseased cells and quarantining certain combs and certain colonies is a very dangerous procedure, and should be condemned by all intelligent and progressive bee-keepers. But say, Rambler, Inspector Bowen should know that it is very dangerous to run those steel points down into the ground to disinfect them. He can not render them harmless by so doing. Any scientist who is at all familiar with

the transmission of disease through the medium of germs knows that nothing but actual boiling, or, better still, heating those points redhot, will render them safe to punch into healthy brood at another apiary. I am sure I am right in this, and therefore I most respectfully urge Mr. Bowen to discontinue the practice or he will scatter the disease. My practice is to take a spear of grass, or, better, a wooden toothpick, and punch it into the suspected cell. After having used it I shove it into the comb and *leave it there*. Then I take a new pick for another colony. After that I wash my hands thoroughly. Inspectors should provide themselves with a whole box of toothpicks on their inspection tours.

So you think, Rambler, I was fond of apricots, and I was. But now look here. Don't you know I was trying to eat as many as *you* did, and couldn't? Apricots—yes, I ate them wherever I could get them, all through California. Why, the dried fruit does not compare with the fresh.

Yes, that jouncer is a capital device. I think so well of it I am going to have it shown in the next edition of the ABC of Bee Culture. On my recent trip I saw where it had been put to use, and I know what it can and will do. It is a great thing. Rambler should have a "vote of thanks" for giving to the general bee-keeping public so good an idea, even if he is mean enough to malign me about my weakness for apricots.—ED.]

WINTERING BEES UNDER SNOW.

"Good evening, Mr. Doolittle. I have been told that bees winter well under snow; and as we have an unusual amount of it for this time of the year (November 29) I thought I would run in a little while and see what you thought about the matter."

"Yes, we are having lots of snow, Mr. Brown—fully a foot on the level, I think, though the wind has so piled it up that it would be hard telling just how deep it is. How did you find the roads?"

"Find them! I had hard work to get here at all. You remember that place up by Hemlock Hill? Well, the snow is fully six feet deep there, and I hear that the stage will not try to start at all to-morrow unless it stills down; and the snow is drifting over a part of my hives next the west side of the apiary, and that is the reason I came to see you."

"The question has been frequently asked in our bee-papers whether it was best to allow the hives containing bees to drift under in winter, and some have talked of putting up a partial windbreak, to the end that the bees might be drifted under."

"And what was the reply to these questions?"

"The reply has generally been, 'Yes, the more snow over the hives the better;' but I do not indorse it."

"Why?"

"Because my experience has been, where hives are covered with snow the bees inhabiting them did not winter well. In fact, I believe that the bees are worse off where the hives are thus covered than they are where there is no snow about any part of the hive during the whole winter. But where the snow can come up to near the top of the brood-chamber, and no higher, it may possibly be a little help; but even then I would about as soon risk their safe wintering with no snow about them."

"This is rather unexpected talk. Can you give me something of your experience, so I can judge somewhat in the matter?"

"I am always free to tell any thing I know that may be of help to any one. For the first few winters after commencing to keep bees I wintered all I had in the cellar, as the man from whom I bought my two first colonies wintered in the cellar. As there was only a small cellar under the house where I lived, and this mostly occupied with vegetables and things needed by the average family, it became crowded as the bees increased, until one winter they did not winter well, so I decided to winter on the summer stand thereafter all that the cellar would not hold without encroaching on the room needed in the same for family use. At this time I ran across a newly found bee-friend who swept the snow up around his hives as it fell, and the idea pleased me."

"What? Go to the trouble of sweeping snow around the hives?"

"Yes; it was only good exercise, you know, or at least that was the way he put it before me; and this exercise, even if it was called work, was much cheaper than it would be to build a cellar for the bees. And so I went to sweeping the snow as it fell around the bees, and by December 10th I had the hives all covered from sight. And let me tell you that the pyramids of white snow all over the bee-yard made a very picturesque view which was quite enchanting."

"Well, I should think it would. But did it stay so all winter?"

"No. At the end of a month we had a thaw; and when I went out to look at the hives I found that the warmth from the bees within had so thawed the snow that a cat or small dog could go all around between the hives and snow. This pleased me, and I said to myself, 'This is just the way to winter bees.' On examination, however, I found that the bees were very uneasy, and, upon raising one corner of the quilt, were ready to fly out and perish on the snow instead of being quiet, as all good bees should be when not warm enough for them to fly."

"How did the matter come out?"

"The rest of the winter we had very little snow; and when spring fairly opened I found I had only 29 weak colonies out of the 50 left out in the fall."

"This was a big loss."

"Yes. But I thought that, had the snow remained on all winter, the loss would not have occurred, so I was anxious for the next winter to come that I might try it over again. The next winter settled the matter, for this time we had snow to keep the hives covered from December to April. But in February there came a warm day and I shoveled out a part of the hives, those not drifted under too deep, and I found the bees in these colonies so loaded with excrement that many of them were unable to fly, while the inside of the hive smelled badly from its being soiled by bees which could not hold their feces any longer. Brood-rearing had also commenced to an extent usually found the latter part of April, and the vitality of the colonies seemed very much worn, while the greater part of the honey which they went into winter with was consumed. When the working season arrived I found that the larger part of the colonies were dead, and I was left with a few weak colonies, combs foul with excrement, and nearly destitute of honey, so I had nearly a total loss except the hives and combs."

"Did you try it again?"

"No, not by the sweeping-up plan; but I have many times had colonies drift under when we had deep snows; and nearly always, where a colony was drifted under so that the snow kept about the hive for six weeks to two months, there was more or less injury done. One year I had snow ten feet deep over a part of the hives, so that I lost track of several of them altogether, the wind bringing the snow from a peculiar direction, over and around a knoll. Of these colonies, not a single one was alive on the first day of the next May."

"This certainly has a bad look from your experience. How do you account for these losses?"

"The difficulty seems to be that, as soon as the hives are covered with snow, the pure air is cut off to a certain extent, which, combined with the warmth from the ground, and the snow not allowing that, and the warmth from the bees, to escape, makes the conditions so unusual that the bees become uneasy, break the cluster, go to breeding, consume an undue amount of stores, and die of diarrhea and exhausted vitality before any of the brood, or brood of sufficient extent, emerges from the cells to take the place of the old bees which are prematurely dying off under these conditions. Young bees brought on the stage of action under such conditions do not seem to have the strength and vitality of those which emerge from the cells during September and October."

"Then you would not advise leaving bees where they are liable to be drifted under snow during winter?"

"No, not till I know what the result would be in my locality. Why I say this is, that some say they are successful in thus wintering, and I am bound to believe them. To know this result, without any great loss, I would try two or three colonies for a winter or two. If they winter well, you can safely try more; and when you are sure of the ground you are treading upon, then you can risk the whole apiary or reject the plan as the case may be. This is the only safe way to venture into any thing we are not conversant with."

RENEWALS are coming in at a heavy rate, as well as new names. For all this we feel thankful. Our readers have noticed, perhaps, that we have been giving extra pages for several months, and from present indications we shall have to continue doing so for many months to come.

WE have just been passing through an exceptionally cold snap of weather, the mercury playing down nearly to zero, and some of the time considerably below. For December it was the coldest on record for many years. It is now, the 28th, very warm, and muddy and sloppy. There was a peculiar satisfaction during the cold weather in thinking that we had so many of our bees indoors.

E. R. ROOT'S LINE OF TRAVELS AND THE SCOPE OF THEIR INQUIRY AMONG THE BEE-MEN OF THE WEST.

SOME are now asking how long the write-up of my travels in the great West will last, as they desire to make their renewals cover the entire period. The series, fully illustrated, will continue throughout the current year; and for the benefit of some who would like to know *what* territory they will take in, I will at this time give a brief outline of my itinerary. There will be one or two more articles on Arizona. Then we will skip over into Southern California. Two or three articles will cover the southern part of the State; two or three the Northern and Central parts; one or two in Oregon; two in Idaho; two or three in Utah; three or four in Western Colorado; two in the Eastern part of the State; then we will jump over into Iowa. Besides these, there will be special articles on the growing of alfalfa, irrigation of alfalfa, and irrigation in general. Then I will have something to say on reclaimed lands that again went back to deserts; of alkali lands and bad lands; of land speculators and their victims. My route throughout the West was aimed to take in some of the best bee country in the world—certainly in

the United States. I found bee paradises all along the route—some of them overstocked and others fine bee-ranges, but in which there were only a very few bees.

Much of the country traversed was new, and just opening. Some places were veritable deserts covered with sand and sage brush. In most of these State and government aid has been or soon will be secured, by which these waste lands are soon to be converted into luxuriant gardens and fruit-ranches.

COMB-HONEY SLANDERS; THE DEPARTMENT OF AGRICULTURE TO OUR RESCUE.

THESE whopping big lies (I don't know what else to call them) keep on going the rounds of the press, hashed and reshaped over and over in a way that is perfectly disgusting; and the worst of it is that some of the apparently reliable *agricultural* papers are taking up the refrain—papers that ought to know better. The publisher of any sheet printing such stuff, without taking pains to use a little common sense, or at least to investigate, ought to be bombarded by bee-keepers everywhere with replies.

As fast as these clippings have been sent in I have been answering them, using respectful and courteous language, stating the facts, but in such a way that it will be easy for the editors to put in a retraction. The following is substantially the reply I have sent to many of the leading papers:

Gentlemen:—In your issue for — there appears an item to the effect that comb honey is manufactured, and that the combs were molded by machinery and filled with glucose. We assume, of course, that you are honest in making the statement, and all we need to do is to give you facts on the other side. We enclose for your consideration an offer that we have had out for twenty years. The terms of it have been published in some of the large daily papers of the country, and we are sending out hundreds and thousands of them now. You can readily see that, if there were any truth in the canards now afloat in the press, there would be a chance for some one to make some money.

We would call your attention to another fact; namely, if combs were molded on dies they would all look alike. If you will take the pains to look at the comb honey for sale on the market you will see that they are very dissimilar in appearance.

Hoping that you will give this matter your kind attention, and help us to rectify the great wrong that is now being perpetrated upon thousands and thousands of honest bee-keepers, whose product is now placed under the ban of suspicion, we remain

Very resp'y yours,

P. S.—Kindly send us a marked copy of your corrected reply, if you can see your way clear to make such correction.

But as one always has more influence in his own locality, I suggest, yes, urge, that every bee-keeper finding his business slandered, and his reputation assailed, send to the papers publishing such matter a respectful and gentlemanly reply, something in the nature of what I have given above. Or, better still, write out your answer, get some one to copy it on a typewriter (because editors take more kindly to type-written matter), and take it personally to the publisher, explaining that your business has been damaged, and as a personal favor you hope he will publish the correction.

Nov. 28 the Chicago *Chronicle* published one of the worst slanders on the honey business I have seen. It was to the effect that bee-keepers *themselves* were implicated in this manufacturing business, and therefore did not like to have the matter exposed. I sat down and wrote as nice a reply to that paper as I knew how, and a few days later I had the gratification of reading in their columns my letter *in full*. The Chicago *Chronicle* is a paper of great influence, and it is to be hoped that the correction will be seen by as many as saw the slanderous statement.

The Ottumwa *Courier*, published at Ottumwa, Iowa, published the usual Jones comb-honey canard. The clipping was sent me, and I replied, substantially as I have given it above in the dummy letter, and later on I had the satisfaction of seeing in that paper a half-column retraction. It seems the editor of that paper, after receiving my letter, wrote to headquarters, the Department of Agriculture, Washington, asking if it were possible to manufacture comb honey, etc. The Department very promptly replied in a long letter, over the signature of Prof. Frank Benton. In this letter the entomologist showed how impossible it was to manufacture the comb and fill it with glucose, and then stated that \$1000 had been offered for a single sample of adulterated comb honey for a period of many years, without a taker.

This coming as it does from the Government of the United States bearing the Department seal will have great weight, and I suggest that those who answer these canards about honey always incorporate in their replies the statement that the Department has denied in toto the foolish stuff that has been going the rounds of the papers.

Now, then, all this talk about adulteration will do no good unless our friends—that is, our subscribers—take the pains to answer these canards *themselves*. Those who write for farm papers on bee topics are especially requested to help turn the tide the other way.

Editor Abbott, of the *Modern Farm and Busy Bee*, and Editor York, of the *American Bee Journal*, are doing some splendid work; but don't, *don't* expect the editors of the bee-papers to do the whole of it. Roll up your sleeves and dip down deep into your ink-wells. And while you are writing, use the most respectful language you know how to command. If, for instance, you call them silly, fools, liars, etc., you will accomplish nothing.

A SUIT FOR CRIMINAL LIBEL.

Later.—Since writing the foregoing we have received a copy of a daily paper, the name of which we will not mention for the present, that actually goes so far as to say the Root people, and E. R. Root in particular, are engaged in the business of putting out bogus comb honey filled with glucose, and that we ought to be brought before the Grand Jury for violation of the pure-food law.

We have put the matter in the hands of our attorney, for we think it is high time to make an object-lesson. Our own name, as well as that of bee-keepers as a whole, needs to be protected, and it will be, too. We expect to begin both a civil and criminal action.

PROF. GILLETTE'S MEASUREMENTS OF BEES' TONGUES; SOME INTERESTING FIGURES.

At the last session of the Colorado State Bee-keepers' Association, at Denver, Prof. C. P. Gillette, an able scientist and a careful and conscientious investigator, read an exceedingly interesting and valuable paper on bees' tongues and the measurements that he has been making during the past summer, and the same is now published in the *Amer. Bee Journal*. "To a student of biology," he says, "particularly if he be an entomologist, the idea of a long-tongued race of honey-bees coming quickly into existence seems extremely improbable. . . . Nature has been breeding this tongue to a standard length for so long a time that it is not likely to vary rapidly under artificial selection where parentage can be controlled on one side only." He took "no interest in the matter when it was first agitated. Finally so many bee-keepers of known honesty and sincerity of purpose began to advocate breeding for long-tongued bees, and to advertise such bees for sale, that it seemed necessary that some one having the facilities and the necessary training should make a careful study of the subject and report the results," and he accordingly went to work.

For some time back he has been gathering specimens of blacks, of Italians, of Cyprians, Carniolans, and of *Apis dorsata*; but before giving his measurements he very properly draws a distinction between tongue *reach* and tongue *length*; and then he goes on to say that he believes "for practical purposes it may be always considered true that the bee with the longest tongue has the longest possible tongue reach." . . . "In my first measurements," he adds, "tongue *length* only was taken into account; but in the later ones, the tongue *reach*, so near as I could measure, was also recorded; and an examination of the figures in the following table will show a far greater variation in the latter measurement than in the former."

Next he describes the various agents that were used to kill the bees. Chloroform, alcohol, formalin, cyanide of potassium, and boiling water were all tried; but the last named was found to be the most satisfactory. In Prof. Gillette's table I find the whole tongue length of Italians averages, in hundredths of an inch, a trifle over .25. The average length of the ligula only was about .16%. In the matter of tongue reach he found considerable variation—that is, the distance that the bee can reach into a flower-tube, measuring from the end of the tongue up to the point where the tongue comes out of the jaws. The longest tongue

reach of those Italians already referred to was .22, while the shortest was .15. The variation in the tongue reach as shown in Prof. Gillette's table corresponds very closely with a similar set of measurements that we made here in Medina, and the variation is considerable. We never measured total tongue length, or length of ligula, for the simple reason that we did not have proper facilities for dissecting the bees; and, moreover, we felt that it was not length of the whole tongue but length of *reach* that was the important point to know.

Another interesting fact developed by the table is that Cyprians furnished by Frank Benton showed a greater tongue length and a greater tongue reach than the Italians. The average tongue length for Cyprians was something over .26, while the longest tongue reach was .23, and the shortest .19.

Carniolans, also from Frank Benton, showed a tongue reach and a tongue length corresponding very closely to the Italians; while the same measurements for black bees dropped down about a hundredth of an inch for a total tongue length, while the tongue *reach* itself of these same black bees fell considerably short of the Italians clear through. The longest of the Italians was .22, and of the blacks .19.

Another striking fact is that both the total tongue reach and tongue length of the *Apis dorsata* is nowise in excess of similar measurements for Italians. Indeed, the tongue *reach* itself is not so great. From this it would appear that, if these measurements are relatively correct, we should not, as has been supposed, by importing these bees secure greater length of tongues, nor would there be any direct advantage in the matter of fertilizing certain flora having flower-tubes so deep they can not be reached by the common bee, *Apis mellifica*.

But the figures showing tongue *length* of bumble-bees is in somewhat striking contrast to those showing the measurements of the other bees. While the longest tongue length of Italians is .26, the longest of the Cyprians .27, Carniolans .26, and of blacks .25, the bumble-bees show a maximum length of .58 and .50 as the average, with a minimum of .45. Apparently the tongue length of bumble-bees varies considerably. This might be accounted for by the difference in age of the bumble-bees measured. It will be remembered that the bees of *Apis mellifica*, when a week old, are as large as they ever will be, while those of the *Bombus* vary in size considerably, according to age.

In commenting on his table Prof. Gillette says, "The extreme variation in tongue length in Italians was but .02 of an inch. It was the same with the Cyprians, and was but .01% with the blacks. The average tongue length with the Italians exceeds the average of the blacks by only .014; and the Cyprians' tongues exceed the Italians' by .0065. An examination of the table will show eight lots of Italian bees with an average tongue length exceeding that of the

best lot of long-tongued bees. I shall have to conclude that, so far as my study of the subject has gone, there has been no indication of any strain of the common honey-bee, *Apis mellifica*, worthy of the distinction long tongue; and if any of the bees examined are worthy of such a name it is the Cyprians. . . . I have received bees from colonies that were said to work freely on red clover, and along with them bees from other colonies in the same apiary that were said *not* to work on red clover, and I have been unable to find any difference in the tongue lengths in favor of the clover workers."

In concluding, Prof. Gillette says:

I do not wish to carry the impression that I think it would not be to the advantage of a honey-bee to have an increased tongue length, but I can hardly understand how the addition of one or two hundredths of an inch is going to help very much to gather honey from red clover. The length of the corolla-tube through which the tongue must reach, in the heads of red clover that I have examined, have varied between .34 and .37 of an inch. The extreme reach of the tongue beyond the mandibles in any bees I have measured has been .23 of an inch. It makes me wonder if it is possible that those who think bees have gathered honey from red clover can be mistaken, and that they visit the blossoms of this plant for pollen only. This is only a suggestion, but some one who has the opportunity should settle it for a certainty.

In regard to this last, I feel that Prof. Gillette has gathered a wrong impression, and certainly wrong in supposing that pollen may be the only thing sought by the bees. The red-clover corolla-tubes grown throughout the East, as I have measured them, in hundredths of an inch, vary all the way from .12 to .36 or .37 in length, the depth increasing from the outside to the center. In the rain-belt, at least, I am sure I am right for these measurements. What they may be in Colorado I am not able to say. As nearly as I can estimate, half of the tubes in an ordinary head of red clover come within the range of .20 and .22; so that the bees that have a tongue *reach*, no matter what their tongue *length* may be, will be able to gather from half of the tubes; and probably half of all the nectar in the head, as they get some out of the long tubes. That there is honey in these tubes is well known, a fact which can be easily demonstrated. All one has to do is to pull the tubes at the right season of the year, squeeze one between the thumb and finger, and a good-sized drop of nectar will issue from the end. Nay, I have gone further. I have watched bees working on red clover, and I have repeatedly seen them extract all the nectar out of the shallow tubes, and draw it down in the long tubes to a point just equal to their reach. While the bees do, of course, gather some pollen from red clover, yet I think the fact is demonstrated beyond doubt that tons and tons of such honey is gathered, because there are times when nothing else is in bloom, and the bees will store in sections quantities of honey that tastes very much like the bumble-bee honey of our boyhood days. On all other points I believe the professor's conclusions are mainly correct, except that some bees

have greater reaching powers, probably, than actual measurements will show. His tables show a variation in tongue reach in Italians from .15 to .22. It will be noticed that he says he had measured the tongues from red-clover bees, and also the tongues of those that were said *not* to work on that plant, and that he was "unable to find any difference in *tongue length* in favor of the clover workers." The italics in this case are mine. It would be interesting in this connection to know whether those same bees showed a difference in tongue reach; for, as the professor has very properly shown, there is a difference in tongue reach and tongue length, and the variation of the former is much greater than the latter.

It has been shown—indeed, I believe it is generally admitted—that some bees will gather much more honey from red clover than others. Whether there is a physical difference between them has not been proven so far; and, to speak frankly, it looks now as if tongue *length* certainly has nothing to do with it. Whether tongue *reach* has or not, will have to be determined by means of much more perfect glossometers than have yet been devised. I say *glossometers*, because I am convinced that the rule plan of measuring (which I have hitherto advocated) is not altogether reliable. It gives an *idea*, but does not show, as Dr. Miller says in *Stray Straws* in this issue, what the bees *will* or *can* actually reach when alive.

I have had much to do in stimulating a demand for red-clover bees. My idea all along has been to develop a race that would be better workers. The mere question of tongue length was an incident and not an important part of the problem, as will be evidenced by the fact that we of the Root Co. never advertised long-tongued bees except once, and immediately withdrew that advertisement. Our advertising, with this exception, has referred to red clover because we were sure that we had a strain that distinguished itself away beyond any thing else we ever tried, and because we were also sure that some of the daughters from those same mothers had done equally well. We purposely did not emphasize long tongues in our advertisements, for the value of that organ, whether long or short, we felt had not at that time been determined. Editorially in *GLEANINGS* for last April, page 296, I called particular attention to this, and again at other times.

I wish to say this in justice to those who have advertised long tongues: The queens they have sold have, so far as I know, been red-clover stock, and the tongues were only an incident, or supposed to be such. So sure have our friends been that long tongues were part and parcel of red-clover-gathering qualities, that they have in some cases made mere measurement predominant instead of some other quality unknown and yet contributing to the peculiar energy which was shown when red clover was in bloom.

NOTES OF TRAVEL.

The Celebrated Tree Cacti of Arizona; the Cactus as a Honey-plant; the Growing of Alfalfa Hay; how it is Stacked Up.

BY E. R. ROOT.

In our last issue I spoke of the fact that Mr. W. L. Chambers, the "big little bee-keeper," had come after me with his little trotter and light buggy, both of which had been purchased with the proceeds of honey sales. We had planned to drive to Phoenix, and in doing so we had to pass by a cactus forest, perhaps the most remarkable in the world, on the main road leading from Tempe to Phoenix. As we came up alongside of these magnificent specimens of tree cacti, monarchs of their kind, I could not help thinking of my old boyhood days at school when I was studying geography, how I used to look at the pictures of these giant cacti, or what seemed to me to be very funny trees then, and whether or not I should ever see the real thing. I asked Mr. Chambers to drive up near some of them while I with my little pocket kodak would take in a more permanent reminder of them, and here are some of the "shots."

Fig. 1 is a good specimen of the giant tree cacti, and the aforesaid horse and buggy. Something of an idea of its size may be gathered by the height of the vehicle close beside it. As nearly as I can figure from a comparison of heights, this specimen is about 40 feet high. On the top of these cacti (see Figs. 1 and 2) will be seen small objects. They are nothing more nor less than beautiful blossoms that yield copiously a rich thick nectar. Quite a little swarm of bees will hover around them,* for all a bee has to do is to dip down into one of the great big cups, and drink and drink to its fill. Then it flutters off, scarcely able to fly, while the others are gorging themselves only to go back home in a lazy uncertain flight.

* They were thick around them when the photos were taken; but on account of their small size, of course they do not show.

In Figs. 1 and 2 it will be seen that the bark or outer coating has been broken away. A closer view shows a ragged cork-like cellular substance in the center. In front of the magnificent specimen in Fig. 2 stands Mr. Chambers. If we figure that he is 5 feet 7 inches, then this cactus is somewhere about 30 feet high, and the two smaller ones are about 18. Again, comparing the familiar object—a man—with the cactus we find that the latter specimen in Fig. 2 is about 18 inches through. Others that I saw were about 20 inches.

In Fig. 3 we have a general view of the whole forest of tree cacti. Over in the distance will be seen the mountains near which orange-growing, I was told, was possible.

The broad expanse of country shown in this general view is a perfect desert. Nothing will thrive there but these cacti; a peculiar kind of thistle, or what seemed to be such to me, and the ever present sage brush; and yet, on the *other side* of the road were beautiful market gardens and fields of alfalfa. Why this difference? you ask. The one can be irrigated, and the other can not; and I hope it never can, because this desert has some attraction just as nature left it, and man should not be allowed to desecrate it.

As I was going out over the barren side I was particularly cautioned by Mr. Chambers about running across a rattlesnake or a "gilamonster." I took the hint, walking carefully, and keeping a respectable distance from any of the sage brushes under which these reptiles would

be likely to coil and "strike." Every now and then there would be the mound of a prairie-dog. If we kept still long enough these little animals would come out and utter their protest in a series of vigorous little barks. Once in a while a genuine jack-rabbit would start up and speed across the sandy waste, and such ornery-looking things! Such legs and such ears!—so long and ungainly that the animals were originally named "jackass" rabbit, subsequently shortened to "jack-rabbit." So large is the animal as a whole that the first time I saw one as it sped through the bushes I concluded it must be either a small deer

MR. W. L. CHAMBERS IN FRONT.

or a coyote. But, to return to the cacti. This forest, as shown in Fig. 3, is probably the largest, both in the number of trees and in its general size, of any in the world. There seems to be no apparent effort to preserve these magnificent specimens. They are mutilated by curio-seekers tearing off a piece of the bark. Fig. 1 shows how the trunk of one specimen has been injured. Then, as if the work of civilized man was

not enough, the Indians mutilate them with their bad aim, throwing stones to knock down the fruit that develops from the flowers, of which the bees are so fond. Indeed, there is no way by which this fruit can be gotten but by pelting it down. Taking it all in all, it seems too bad that the general government is not taking more active measures to preserve such magnificent specimens of cacti—specimens that take years

FIG. 3. THE CELEBRATED FOREST OF GIANT CACTI ON THE ROAD LEADING FROM TEMPE TO PHOENIX, ARIZONA.

to grow, and that landscape gardeners in the Eastern cities would pay thousands of dollars for if they could only cultivate them.

Speaking about the fruit of the tree cactus reminds me that no one but an Indian can eat it. It affects white men very seriously, and some have been known to die

from it; for it has a beautiful flavor, and therein lies the danger. Before civilization had encroached on either side of this magnificent forest of cacti, the Indians were in the habit of getting water from them. There is a trick about it that they alone understand; and although the water, I am

FIG. 4. A FIELD OF ALFALFA IN FULL BLOOM.

told, is somewhat brackish, yet to one almost dying of thirst I suppose it has all the freshness of the delightful cool springs that we knew in our childhood days.

After I had snapped the kodak right and left, I got into the buggy again; but as I did so I turned back lingering eyes, thinking that *perhaps* it might be many a year (and possibly never) before I should see the remarkable sight again.

GROWING ALFALFA.

To me, one of the most interesting developments throughout the arid regions of the West was the growing of alfalfa. Almost no other hay will grow in those hot irrigated districts, and yet this thrives wonderfully. A hot dry climate and moist roots give us a fodder that, for fattening cattle, and making them grow *sleek and handsome*, beats any thing else I ever saw. For work horses it is not quite the equal of timothy or oats; but as almost nothing else is to be had, except at considerable expense, farm horses are able to do a big day's work on it, so I was told.

When Mr. Chambers and I were driving by one of his apiaries we came across a field of alfalfa that had reached its perfection of growth. It was in the height of bloom, and the beautiful violet blossoms, and the hum of the bees, made a combination alike pleasant to sight and hearing. I attempted to take a photo of it, but the result was very disappointing. However, I will show it to you as it is. If you were standing out in the field the tips would

FIG. 5. DRIVEWAY TO THE BROMELL BROTHERS' HOME.

FIG. 6. METHOD OF STACKING ALFALFA HAY.

reach very nearly up to your chest; for, as I have before explained, alfalfa grows in Arizona, especially in that section, as it does nowhere else.

But one of the novelties to me was the mode of harvesting this crop. It is cut with mowers as we cut hay in the East; but instead of being put into barns it is always put up outdoors in stacks, giant in size as compared with the little mounds of hay in the rain-belt. Some of these great masses of alfalfa hay, I should judge, were 60 feet long and 25 wide. Instead of pitching the hay from a wagon with a pitchfork on to the stack in the good old-fashioned way, it is carried up by a simple piece of mechanism. But before I show you this machine let me give you a view of a little driveway approaching the fine residence of some of our bee-keeping friends, the Bromell Brothers. They are located near Phoenix; and the house, a new one nearly finished, was at the end of a beautiful drive bordered on either side by palms, cacti, cottonwoods, and other growths peculiar to that climate. And such palms! Many a millionaire, or even one in less comfortable circumstances, would

give much for a single specimen of what grows in Arizona as free as ragweeds in the East. I attempted to take a photo, but this, too, is disappointing. However, I show you the result. The palms show very indistinctly; but one can get some faint impression of the approach to the Bromell Brothers' home.

Well, on arriving there I found them in the rear, stacking hay. A sister, Miss Alice Bromell was driving the horse while the boys, Albert and Fred, were attending the stacker. Miss Alice, evidently fearing I might show her up in GLEANINGS, disappeared, for I had my kodak in hand, and probably looked as if I *might* do some kodaking before I left the premises. The appearance did not belie the intent. The sight was so novel and interesting that I proposed to take in some permanent reminder of how farming is carried on in Arizona, and I did, and luckily for Miss Bromell. The alfalfa hay on the wagon is stationed near the stacker, or what we might call a light derrick. A grappling-hook having four prongs, and in some cases only three, grabs hold of almost a cartload at once. The attendant who drives the horse starts him forward, and immediately the rope traveling over the tackling lifts the load, elevates it to the proper height, and then by means of another small rope the spar or side arm is drawn around until the load stands exactly over the spot where it is to be dropped on the stack! A man on top scatters it evenly, and then is ready to take care of the next bunch of hay. It takes three people to operate it, but these three, with the horse, can do the work of a dozen or so of hand-pitchers, and so much more easily.

The climate in Arizona is so dry and warm, and there is so little rainfall, barns are not needed.* It is, therefore, not necessary, or not so much so, to make the stack shed water as with us in the East. The alfalfa is piled up until it reaches the height of 15 or 20 feet, and then is left to stand till used. The hay, when stacked, is of a beautiful light-green color, and remains so for a year or more, or until it is used, except the portion that is exposed to the direct rays of the sun, which bleaches it somewhat.

The stacker shown in the illustration seems to be a simple home-made machine; but whether shop or home-made, no one in the West would think of trying to stack hay in the old-fashioned way—in fact, it would be simply impossible. Stacks such as we have in the East would be altogether too small; and, besides, the hay would bleach too much. These large mounds economize room, and at the same time keep the hay in much better condition for stock when it is needed.

I also took some views of the Bromell Brothers' apiary; but as they were so much like all the rest of the Arizona yards I do not reproduce them here.

*This is true of all the alfalfa-growing regions in the West that I visited.

J. S. W., Miss.—As to how to get the honey out of the supers into the brood-nests, I would state that the task is not an easy one—that is, if you expect the bees to carry it below. If you rake over the surfaces of the sealed combs with a wire brush, causing the combs to “bleed,” the bees *may* do something in the way of carrying the honey down. But a far better way is to take those same combs, extract them, and sell the honey; then feed sugar syrup in the regular way to give the bees the requisite amount of stores. As to the combs, it would be advisable to set them on top of some strong colonies, where they may be cleaned up by the bees, and at the same time be protected from the ravages of the moth. But I would advise letting the bees clean them and then put them in hives or supers that are both bee and moth proof; or you can store them in a room, fumigating them with bisulphide of carbon, or with sulphur, then shutting the room tight. We use eight-frame hives at the Home of the Honey-bees; but in the South, where extracted honey is produced, the ten-frame size is generally preferred.

DEAD BROOD NOT CAUSED BY SULPHURIC ACID.

J. B. G., La.—With reference to the matter of sulphuric acid and our instructions regarding its use, I have to say that you are laboring under a misapprehension when you suppose that the acid used in refining wax for foundation kills brood. Sulphuric acid is very much heavier than water—so heavy, indeed, that the water will settle down to the bottom of the tank that is intended to be used for the refining of wax. If you are familiar with chemistry you will know that the specific gravity of the acid is considerably greater than that of water. If we put 10 per cent acid in water, then throw in cakes of wax, turning on the steam or heating the wax, acid and water will all mingle together. Our instructions are, after the wax is thoroughly melted, to cover up the barrel or tank and allow the whole mass to cool slowly. All the free wax, of course, rises to the top; the water settles to the bottom, and in turn the acid settles to the very bottom of the tank or under the water. The water and the acid do not make a chemical mixture, but what is termed a *mechanical* mixture, and will, therefore, separate when at rest by their difference in specific gravity; therefore the acid does not remain in the water, as you supposed, in a way to affect the foundation or the wax. Thousands of pounds of our foundation are used all over the United States, in hundreds of localities where there is no foul brood at all.

Go ye into all the world and preach the gospel to every creature. MARK 16:15

A great many people seem to think this means that we are to go to some of the distant islands of the sea, to Africa, possibly China, or to hunt up some place where there are savages who know nothing whatever of the Bible. But a few, thank God, recognize that there is need of preaching the gospel, or, perhaps, *teaching it*, right here in America. Sometimes right in our own town—yes, may be just across the street, or almost next door; and, come to think of it, I shouldn't wonder if there were professing Christians who are neglecting or forgetting to preach and teach the gospel of Christ Jesus among the inmates of their own home—among the hired help, for instance. Why, I almost got into a jangle with quite a lot of my good friends because I ventured to suggest that, if the hired man or hired girl sat down to the table with the rest of the family, it would give a better opportunity, by precept and example, to speak of "free salvation" to all.

For some years I have known more or less of a work started by a single person in Buffalo. This person is a woman, and not a very big one at that—a girlish-looking woman who started out alone, almost single-handed; yes, and she chose for her location one of the worst spots in that great city. When my companion and I got off the cars rather late one December afternoon I inquired for a street-car that would take me either to or near 150 Erie St. My informant said there was no street-car line that way, but that it was only a little way from the Lakeshore station, and that we could easily walk it. He indicated with his hand the direction we were to take. Now, I had made up my mind I would make quite a lot of inquiries—more than I really needed to, for that matter, in order to find out what I could about Miss Mary E. Remington, and of the work she is doing. I first asked two boys how far we were from 150 Erie St. As the direction was a little complicated one of them asked me whom I wished to see there. I said I wished to see Miss Remington.

"Oh! that is all right if you want to see her; but you had better go this way."

Then he told me where to turn, etc. Then I asked a man with a big rubber coat on, well bundled up. When I gave the street and number he said:

"Are you going to Miss Remington's?"

I assented.

Then he added, as he looked myself and companion over:

"Why, your shortest cut would be down Canal St.; but you stand a big chance of being robbed there. Look here. I will go with you and show you the way."

I told him he need not take all that trouble, but he said it was all right. Other inquiries of a like nature were made. When I asked some of the boys if they knew Miss Remington their faces brightened up as one of them said, "You bet." The other replied to the effect that she was one of the best women in Buffalo.

Pretty soon we came in sight of a large five-story building besides the basement. In large letters on the bricks across the side facing the canal were the words, "Remington Gospel Settlement." This was somewhat of a surprise to me—yes, it was one of my "*happy*" surprises. I knew something about how Miss Remington had been struggling against great odds, and battling with sin and Satan almost empty-handed. I knew how she had, with her frail strength, engaged in what you might almost call hand-to-hand conflicts with the powers of darkness. But I did *not* quite understand how every boy on the street *knew* her, and seemed to feel a manly pride in speaking her praise; but I understood it afterward. This big building she occupies, besides furnishing her various school-rooms that I will tell you about later, furnishes homes to something like fifty families of Italian people. Of course, each family has only a small apartment. Miss Remington is not only a friend and benefactress to all these families, but she is likewise on friendly terms with the men, women, and children of the whole of Canal St. in that part of the city. As the man said to us, it is not always safe to go through that part of Canal St., even in broad daylight; but again and again I was assured I could go *anywhere*, day or night, in company with Miss Remington, and would meet with civil and respectful treatment everywhere. Our visit was made Saturday evening. During that evening there was only one exercise—a class in shorthand. Sunday morning, as I looked out of the window I saw across the street an old railroad building that had an inscription something like this: "Free Kindergarten School." I asked Miss Remington if she had opposition in her work.

"Oh, dear! no—not right over there. Those are the quarters I occupied before we came over here, and the sign has not been removed."

During the forenoon we attended church services in company with Miss Remington. I was rather glad to see her drop her multifarious duties and go to church, even if she does have a church of her own on every day of the week. After dinner I expressed a desire to see the empty schoolrooms before the children came in. Supt. Wadge went around with me. When we got to the door of the Sunday-school room a great crowd of children were flattening their noses against the window-panes, and rattling on the door to get in. Mr. Wadge kindly explained that it was fully an hour and a half before the Sunday-school would open. But it was raining, and they begged him to let them

come in and sit down. He told me he was sorry, but it would not do. The room would be filled up in no time, and I found out afterward that it takes all the ability and sometimes pretty much all of the muscular strength of a dozen or more teachers to keep those "street Arabs" in any kind of decorum.

Almost all of these people are Italians. Now, there has been some prejudice against Italian emigrants. I found it especially so in New Orleans; but my mind has changed a good deal since the experience of that Sabbath, regarding the inhabitants of sunny Italy.*

There were different rooms for children of different ages. But the room where I was asked to take a class I should think contained between two and three hundred, and the uproar was like "the sound of many waters." The class assigned me was near the door. I made up my mind almost at once that it was not much use to talk about the international lesson. They had not studied *any* lesson, and did not propose to. I told them I was a stranger from Ohio, and asked questions about Miss Remington and the school, and finally asked the boys what they worked at week days. The largest boy in the class said they were mostly newsboys. I asked some questions about Buffalo, then told them of the "carnival of crime" we are fighting to keep down in Cleveland, near my home. I asked them if Buffalo was having the same siege. Now, I hardly need tell you there has been for years past a sort of rivalry between Cleveland and Buffalo. These boys pretty soon began to mention the advantages of their own city; and as they assured me that Buffalo was a better place, from a moral point of view, each newspaper boy straightened himself up and put on a more gentlemanly demeanor. He was going to demonstrate to an Ohio man that Buffalo was at least a *respectable* city, and that that *school* was a respectable and well-behaved one. In fact, they discussed with animation this problem of crimes as if they might be one of the "city fathers." Only God knows whether or not they may *not* some time help hold up righteousness and put down iniquity in the city of Buffalo.

After the school was out, Mr. Wadge

congratulated me on having held the attention of the worst class in school better than their teachers usually succeeded in doing; and Miss Remington informed me later that the large boy (the worst one in the lot) wanted to know if the Ohio man would be there in the evening. Of course, I was only too happy to say I would be at their service. Somebody wanted to hear me talk about bees. I gave the boys some of my early history—how I felt that God called me, even when I was very small, to the study of insects. Then I spoke of the stories in the newspapers about manufactured comb honey. Said I, "Boys, the world is now making great progress in the way of invention and discovery; but do any of you believe that mankind will ever succeed in manufacturing *strawberries* just as good as those that grow on the vines?"

They came out very promptly, declaring that strawberries could not be manufactured. Then I explained to them that, in a like manner, the art of man would never succeed in manufacturing comb honey that would pass at all for the genuine made by the bees.

"By the way, boys, do you know any thing about strawberries? Do you ever pick them in the fields?"

At this so many hands went up that I thought they were telling me fibs; but Miss Remington assured me afterward that it was all true. She said that, in winter, they live in the city, and rent rooms in her building and other buildings; but when it comes time for working in gardens in the suburbs, they move out into the fields, whole families coming and camping out, while they pick strawberries, weed onions, and do any thing else the farmers want them to do. So they told me the truth when they said they knew all about strawberries.

During my talk there was a constant running fire of comments and questions. Miss Remington and the teachers tried in vain to restrain the boys; but I told the teachers to let them talk—in fact, I rather enjoyed having an audience that showed by its responses that they caught on to not only every word and idea but their buoyant imaginations supplied a good many things that I had not thought of, and *should* have never thought of. At the close of my talk I assured them that God had a special place, or a call for every single boy or girl in that crowd, and the great thing in this life is to find just *what* God has fitted us to do *best*. I pointed to Miss Remington, and said, "This good woman right here has had a *peculiar* call. God called her in a different direction from what he has called any of the rest of us. Boys, can you suggest to me what he called *her* to do?"

Almost instantly the reply came from different parts of the room, "He called her to look after us boys;" and I honestly believe that all try to show by their lives that they believe what they said.

Just as I was leaving the speaker's stand, some boy wanted to ask another

* By the way, shall we not all remember that Marconi is an Italian? I know America has been in the habit of claiming that we are head and shoulders in advance, especially in science and great mechanical developments, of the rest of the world—but just now that young athlete in electrical science (and I rather suspect in almost all other sciences as well) is talking across the ocean, and that *without a wire*; and just as the news came flashing through our daily press, a most disgraceful and humiliating report followed it, to the effect that the proprietors of the Atlantic cable (I hope they are not Americans) were trying to serve an injunction on him because they claim they had a "patent right" on using electricity across the ocean. Think God there is no patent on the water we drink nor on the air we breathe; and the idea that any person or corporation has a monopoly of the space above, in the waters or under the waters, or *through the solid earth*, to prevent this young scientist from sending his vibrations unhindered, seems to me the biggest piece of absurdity the world ever saw.

question. His teacher was inclined to hush him up; but I begged her to let him tell what he had to say. He said, "Mr. Root, can you tell us all about how to make macaroni and cheese?" At this there was a shout all over the room. When the uproar had subsided a little I said, "I am sorry to say, my young friend, I can not tell about these things. I know something about strawberries—in fact, I have written a book about how to grow them, and I know quite a little about bees; but I do not know about these other things you mention."

Now, if you wish to know more about the Remington Gospel Settlement, write to 150 Erie St., Buffalo, and Miss Remington will send you a report of their work. In conclusion I wish to make some extracts from that report. I have selected the branches that appeal most to my sympathies.

Keeping the girls from the street, or worse places, and teaching them things which will be of use all through life, we consider a very important part of the work. They thoroughly enjoy sewing, and most of them would like to begin on dresses. We do not wonder at this desire, after seeing some of the dresses they have to wear. They are expected to work on aprons or under-clothes until they can do fairly good work. Among the teachers are three dress-makers, and they have had their hands full teaching the girls to cut and fit their own dresses. Often a girl supplies her own material, which she brings to the class, and cuts it out, takes it home to sew, and brings it again the next week for a little more help. The girls try to learn all they can, for they are anxious to be able to make their own clothes at home, and some of them have done exceedingly well at this winter.

When we supply the material, the girls pay four-fifths of the cost, and are required to finish the garments in the club. We have 72 names on the roll-book, and the girls have all been very faithful in attendance.

There has also been a class in knitting, in which several of the girls have learned to knit the mittens that will keep their hands warm next winter.

At one time, Mrs. H. H. Boyce very kindly gave the older girls a course of lessons in cooking, which proved very delightful and beneficial. They practiced at home what they were taught in the class, as the recipes selected were for articles not expensive, yet very palatable and wholesome.

This year the work closed with a sewing-contest, which lasted two nights, and caused great interest among the girls. Each member of the class made a model apron, showing the best she could do in button-holes, gathering, hemming, etc. Prizes were awarded for the best work, and those who were not so fortunate as to receive one made themselves happy by representing books at the "Library Party," which followed.

KITCHEN GARDEN.

The usual work, dish-washing, bed-making, etc., is carried on; but the little ones love best to set the table and play "The Smith Family."

"Teacher, what a lot of things you put on your table," remarked one little maid, who enjoyed the appearance of the clean cloth and dishes. Another child marvels at what she calls "the little towels," and never fails to report any unfortunate member of the Smith family who fails to use her napkin in the right way. A great delight for the children has been the stories told by the teachers. One little girl gives her own version of what was told at the previous meeting, and then the class is rewarded by a new tale. Besides the pleasure which they give, the stories have helped in another way, for they are sometimes used, as the teachers have learned to keep the baby quiet and amused for a while at home, and so relieve some tired mother.

Baby, who has not yet joined the class, sometimes has a stoic sister of six or seven, who saves, for the little one at home, her bit of candy or a caky, or perhaps shares it with a teacher unlucky enough to have been skipped when the evening's treat was passed around.

The children manage to spend a happy evening in work and play, and are as easily governed as seventy-five or one hundred small, live creatures put into one room could be expected to be.

MANUAL TRAINING.

April 1, 1901, closed our third year of work in the manual-training department. During the three years we have endeavored to make a careful study of the conditions and problems confronting us, and by judicious experiments to discover the method best suited to our needs.

Our lesson-periods have been ninety minutes, one evening each week, from October to April; our equipment provides for twelve boys, using the Rochester desk top, designed by Prof. Murray. Our classes have been made up of boys from about nine to fourteen years of age, including American, English, Irish, Hebrew, Italian, French, German, and Polish nationalities; and the subject-matter has consisted of exercises in wood-working, ranging from knife-whittling in thin wood to the construction of objects involving the simpler joints, elementary geometrical drawing, and some Venetian bent iron work.

We have endeavored, as far as possible, to introduce no abstract exercises, but to make the work interesting to the boys by selecting for each model a finished article.

Our work, under the conditions that obtain here in the settlement, differs in almost every way from the work carried on in public schools. Many of these boys, living as they do in tow-path shanties, house-boats, or ill-kept tenements, exhibit evidences of arrested development. Many things intelligible and interesting to the average schoolboy do not seem to appeal in the same way to these children; consequently our public-school courses and methods could not be used except by extensive modification, and in some cases not at all.

Working under the conviction that the first thing necessary is to secure and retain the interest of the boy, we have from time to time been led to discard an idea or model or method that did not seem to work toward that end. The chief aim at all times has been to produce results in character-building, while the specific results in models and in hand skill have been of distinctly secondary importance.

SHOE-REPAIRING.

Knowing that many of the men in our neighborhood repair their own shoes in a rude way, we asked the boys if any of them would like to learn to do it properly. So many applied for admission to the class that we had to select those who behaved the best, as only twelve could be taught at one time. As all the boys in this class were Italian, and many could not speak much English, we engaged a first-class Italian shoemaker, Mr. Louis Barone, and the class has done remarkably good work. They have not only mended their own shoes but have brought shoes from home to repair, and have mended for some of the other children who attend the different classes. Shoes that are sent in, very often need mending, so they are put in the repair shop, mended, and then sold in the sales which we usually have each month. The boys have done very nice work.

THE MOTHERS' MEETING.

The meeting is scheduled to open at two o'clock, but nearly every week many of the women are at the door at half-past twelve or one o'clock, and hardly ever a woman is later than half-past one. They all seem to think this is the pleasantest time in the whole week to them. A great many of them work out by the day, but they will not work on Wednesday if they can possibly avoid it.

During the first three months of the present year Mrs. Boyce gave cooking-lessons, and they all enjoyed them very much. The lessons were all such that the women could go home and make practical use of what they had been taught, and the next week they would tell of their difficulties, if they had any, and get pointers as to what was the trouble.

If Mrs. Boyce could see the improvement in some of the meals that are served in the fifty homes that she came in contact with in giving the lessons, she would feel fully paid for her labors.

All the material used in connection with these lessons was donated, which was a great help.

After the cooking-lessons were discontinued the women returned to their usual occupation of sewing. They make up garments for themselves and their children, and pay for them, when finished, four-fifths of the original price. The little sales, as referred to in another place, supply the other fifth, so that this branch of the work is practically self-supporting.

Each gathering is closed with a short devotional service, prayer, short Bible-reading and singing, and all the women stay to this service. These meetings are

continued throughout the year, excepting for about a month in the summer.

As often as possible we give them light refreshments, consisting usually of coffee and graham bread, of which they are very fond. They say they would rather have it than cake, and it is much easier and cheaper to make.

WOOD-CARVING AND MANUAL TRAINING FOR GIRLS.

Two years ago we tried the experiment of having a manual-training class for the girls. As we had tools for only eighteen, the others who wanted "to be" in it were obliged to wait until some one dropped out, but no one seemed to want to drop out. They were given the same course of instruction as the boys had the year before, geometrical drawing, knife-work, and the use of tools in making small articles. The girls took great interest in this class, and some of them liked it even better than sewing, which is saying a good deal.

During the past winter the class was given instruction in wood-carving, which has been very fascinating to some of them, and they have made some very pretty articles.

SEWING-SCHOOL.

The sewing-school is divided into two departments, one for the older children and the other for the children too young to sew, from seven years old down to six months or younger, for, of course, every little girl must bring the baby.

These little children, of whom there are about 125 present each week, are in charge of some young ladies from the Central High School, who have been very faithful in their work of love, and the children are all very fond of their teachers. They have divided their department into two classes, one for the very little ones who are entertained and taught little songs and games, while the others are taken into another room and taught kindergarten sewing.

In the main room the children are first taught the stitches, and, after they can do them nicely, are given a skirt and then an apron to make. They have done very good work. Many of the children have not been absent during the whole year. It is very amusing to go to the homes and see some of the little girls making aprons for their mothers or showing them how to do it. At one place a little girl brought forward a garment and asked how to gather it and put on a band; and when she was told she turned to her mother with, "There, I told you that was the way teacher said put it on." The mother said she had to do so much other work she did not know much about sewing.

The women on the street have said to us many times, that, if there had been any such place as this for them to have gone when they were little, and they could have been taught as these children are, they would never have gotten where they are now.

PENNY SAVINGS BANK.

When the bank was first established, the people were careful not to put in very much money till they had tried drawing some of it out, in order to be sure they could get it. This feeling soon wore off, and they began to increase their deposits. We have now 248 depositors.

Some of the boys, who black shoes and sell papers, have saved as much as twenty dollars each. Often when they get ten or twelve dollars in the bank they have to draw it out to help at home—pay rent, buy coal, etc. Several of the girls who are working have also saved quite a good deal.

The very little girls and boys have saved quite large sums by depositing just the pennies that they would otherwise have spent for candy and cigarettes. Some of the youngest of these have bought shoes with what they saved.

The rule is that they must give at least one day's notice if they wish to withdraw any money. A child sometimes thinks he would like to have a little extra candy, or go to a five-cent show, and starts for the bank; but when he can not get his pennies till the next day the desire is gone by that time and the money is still in the bank.

The women of the Mother's Meeting are saving for coal, flour, etc., and during the past year have bought 186 barrels of flour and 290 tons of coal with money they have saved in the Penny Savings Bank.

A FEW INCIDENTS IN THE WORK.

When we took the house every room in it needed papering and painting, as they were in dreadful condition, but we did not have the money to do it. A little over a year ago a gentleman gave fifty dollars to help along the work in any way needed, so we thought it could not be used to better advantage than to clean up

the house a little. I told the tenants if they would tear off all the old paper, clean the windows and paint, and kill all the bugs, I would have the rooms papered and painted for them. It was fun to see them work. When they were through they came to me, each woman anxious to have me take hers first, and each had some good reason why hers should be the first to be done. One had a daughter who was to be married, another was to christen the baby, etc. I told them I would give them a few days more and then I would take the cleanest place first. Well, the way they cleaned first was no comparison to the way they cleaned after that.

After waiting about a week I went around to see the rooms, and as soon as I started I had a crowd after me to hear what I would say. Every room was cleaned up in good shape, and I praised them all about alike, and when I got through I turned to one woman and said, "Which place do you think is the cleanest?" She shrugged her shoulders and said she did not know. I tried several, but none could tell. Probably each one wanted to say her own, but could not do that very well.

"Well, you can not tell and I can not tell," said I, "so we will begin at the top and come right down through and take you all in turn, and will have it all done quickly." This was satisfactory, so we went to work. The fifty dollars cleaned the two top floors, on which there are twenty two families. The rest of the money came from other sources. The house has never been so dirty since, and one more cleaning will put it in very good shape.

One small kerosene-lamp in each large hall did not furnish a very brilliant light. In fact, a stranger would not have cared to try to find any one in the evening. We thought that, if the halls were lighter, they could be kept cleaner. On making inquiry we found that electric lights would be cheaper than gas, although the cost of either would be about forty dollars, and the question was, how could that much be spared from the work?

A lady in Medina, Ohio, knowing that we wished to do this, said that she would give five dollars, and that her father said that, when it was all provided except the last five dollars, he would give that. A gentleman here in the city said he would give the next to the last five dollars. One and another gave a dollar till we finally had the money in hand, and the whole place was soon brightly lighted with electricity. When the men were putting in the lights several of the women were frightened, and wanted us to take them right out; but in a day or two after the lights were turned on, they came again and wanted us to put them in their rooms. It has had the desired effect, to make them keep the places clean. A light in a dark place has a wonderful effect.

A great many people say that one thing that keeps people poor is that they do not know how to manage.

While we will admit that this is the case a great many times, still there are exceptions, and here is one of them. One of the women at one of the sales bought an old, ragged, rusty coat and a toboggan cap. A few days after she came in to see about getting work, and brought her little boy and girl with her. The little boy had on a coat made from the old coat, which had been washed and pressed and turned, and a little sweater, which she had made from the toboggan by cutting off the top and binding it, and cutting out some arm-holes and binding them. To be sure, it had no sleeves, but with his little coat on it looked very well. The little girl had on the top of the old toboggan for a cap.

This shows only one of the many ways that the women use the things which they get in the sales. Nothing ever goes to waste. They are very proud to come and show us what they have made out of some old thing that it did not seem possible could be of any use. We have been able to have these sales, during the last year, about once a month.

In the spring and fall we have a hat sale, and our friends send us their old hats and trimmings, and then all who can come and help trim do so, and we sell the hats at from one cent to twenty five cents each. Several of the milliners have sent trimmings and hats, and some of them have also given their services to help trim for the sales.

As the receipts from the Mothers' Meeting are only four-fifths the actual cost of the material, these sales make up the deficit.

In closing, permit me to state that Miss Remington has undertaken to purchase outright the great building she occupies. It was fitted originally for a hotel. Before

she got hold of it, it was used for saloons. They have the low price on it of \$10,000. She has already paid \$3000; and, God helping her through the hearts of the people, she expects to pay it all in a short time. The property would bring many times the price mentioned were it not for the reputation the locality has held for so many years; and Miss Remington is fast bettering the name that has so persistently clung so long to the junction of Canal and Erie Sts.

THE JESSIE STRAWBERRY; ITS ABILITY TO STAND DROUTH, ETC.

Along the latter part of July I was trying to ride up a pretty steep hill right opposite the home of William Hineforth, near our Michigan home. When I just began thinking I was too tired to propel the wheel any further up so steep a grade my eye caught sight of some beautiful strawberries sparkling among the green leaves. In fact, the strawberry-rows ran clear up to the road. When my wheel tipped over, somehow or other it tipped toward the strawberries, and I was just about refreshing myself with the tempting beauties when it occurred to me I should be setting a bad example; therefore I left my wheel (and the berries too), and went over and asked permission of Mr. H. to sample his beautiful berries so late in the season. I noticed on the way that every fourth row in his berry-patch was bright and green, while the three rows between were almost dried up and worthless. Said I: "What berry is this, friend H., that stands the drouth and gives you berries worth picking so late in the season?"

"Why, don't you know, Mr. Root? That is the Jessie. You see I planted three rows of Warfield, and one of Jessies for fertilizer. The Warfields could not stand the drouth, and are dried up, as you see; but the Jessies keep right on growing, and bearing fruit. It certainly is a wonderful object-lesson in regard to the ability of the Jessie to stand drouth."

Now, some of you may remember that I assisted considerably in introducing the Jessie. Well, I have never noticed on our grounds that it stood the drouth better than other varieties. Perhaps this is only another peculiarity of location. Yes, I sampled the berries. Now, if you never rode a wheel up a long hill in the month of July, and got tired and thirsty, and then sort o' accidentally tumbled over into a strawberry-patch — why, unless you have been through such an experience, you have never yet *realized* what a wonderful gift God made when he gave strawberries to his children. After I came back I discovered

Mrs. H. and two girls picking berries. I had not noticed them before; but suppose I *had* just jumped off my wheel and helped myself to those berries, as I was tempted to do, without saying a word to anybody. I know it is a small matter; but how much better I felt, and how much better the berries tasted, after I had *permission!* I do not remember now just how much the berries brought a quart; but those Jessies brought a pretty big price after everybody else had quit bringing strawberries to market.

PLANTING POTATOES TOO CLOSE TOGETHER AND PLANTING THEM TOO FAR APART.

Last fall at potato-digging time, Mrs. Root and I were taking a ride across the country in the Traverse region. At one point our road took us right through a potato-patch, and men and boys were digging potatoes close up to the wagon-tracks. Just as soon as I got into that potato-field my eye quickly caught on to the fact that the potatoes were larger, finer-shaped, and more of them, close up to the wagon-tracks on both sides. Where they had not yet been dug the vines were larger, stronger, and thriftier. I stopped the horses and said something like this:

"Look here, friends, do you pick out your nicest potatoes and put them close to the road on each side, just to make people stare, or do they *grow* that way?"

"They grew just as you see them, stranger. Potatoes always grow bigger next to the road, because they have more room, I suppose. You see there are no potatoes on the other side to rob them of fertility and water when there is a scarcity of rain. We were talking about it before you came along; and I believe it is generally the case in this region if not in other places."

I suggested that perhaps the road was traveled enough so the manure the horses had dropped in years past might have made the difference, but they thought not. I have wondered many times why the people in that region planted their potatoes so much further apart than we do in Ohio. You know the men who sell the hand potato-planter figure only five or six bushels to the acre, while we use eight or ten, and sometimes twelve. Now, their potatoes are three feet apart, and sometimes more, and planted so they can be cultivated both ways. But I am sure *early* potatoes could be planted much closer. We had some beautiful Early Michigans last year, and they make only a small top, and are quite early. I was not present when they were planted; but after they came up I said there might have been a hill of potatoes half way between, one way at least, and the whole patch would have yielded almost as many to the hill. But this object-lesson of the potatoes along by the road would rather indicate that there *is* danger of getting them too close in that region. I asked if potatoes always yielded better clear around at the outside of the field, and I was told this was not always

the case. The outside row of potatoes is apt to be ground that is not plowed and harrowed so thoroughly, and oftentimes does not get as good cultivation; and there is more or less tramping on them in turning around. Where the road ran through that potato-patch I am inclined to think they plowed up and fitted the *road*, field, and all. I judged from the looks of things. I suppose they left a vacant strip just wide enough for a wagon to get through. There was certainly no place for one wagon to pass another in that whole potato-field. I am inclined to think that, on very rich ground, well manured and thoroughly fitted, we may profitably put potatoes only three feet apart, and from a foot to fourteen inches apart in the row—that is, we can do that in Ohio, say after we have turned under a heavy clover sod. In the Michigan sandy soil, especially where there has been no clover turned under, and no stable manure was ever used, possibly it may be profitable to put the potatoes three feet apart each way. You see this would make only *half* as many hills in the field; but putting them so far apart would certainly get larger potatoes, and probably more in a hill. If one single stalk is going to give 15 good-sized potatoes, however, as I secured near friend Hilbert's, we can well afford to give such a hill plenty of room, say as we have it in putting the hills three feet apart each way. Now, friends, it is quite likely we sometimes lose half a crop or less by putting our potatoes *too* far apart. At other seasons and in other localities, perhaps we lose almost as much by going to the opposite extreme. Where we get them too far apart we usually have the largest and the most potatoes to the hill. Let us each and all test the matter for *our own fields*.

GINSENG AND GINSENG-GARDENS.

Since what I have said in regard to growing ginseng, I have been assured several times that it is not so difficult to grow—in fact, I find it has been growing in considerable quantities on my place in Michigan. One day when I was at work at that spring I have told you about, a big Indian came and sat down and very quietly began watching me. He did not seem to want to talk; but an “Injun” was something of a curiosity to me, and I *made* him talk. He had a sort of sack hung around his neck. I asked him what he had in it. He then pulled out a big handful of fresh ginseng roots just dug. To get acquainted I gave him 25 cts. for the biggest root in the lot. Then I asked him if he found them growing in *my* woods. He nodded his head in the affirmative. I then asked him if he could show me the growing plants. He did not want to answer, but finally admitted he could. I offered him 25 cents more to show me the growing plants, so I could see what they look like. He said he would bring me one, top and all; but when I wanted to go with him and see him dig them he shook

his head. Finally I agreed to give him 25 cents to bring me a whole plant, top and all. He disappeared in the bushes, and came back in a very few minutes with a root in one hand and a top in the other. Some of my friends told me afterward that the Indians remember the particular spots where the ginseng grows, and they get roots there more or less every year, leaving the small ones to grow until they are large enough to dig. He did not want me to know where the ginseng-patch was on my own land.

A few months later I heard boys' voices off in the woods one Sunday afternoon. I hunted them up and inquired what they were doing. I found they had collected quite a lot of little ginseng roots. The Indians save the small ones to grow larger; but those boys dug every thing, little and big. This was in October; but the little roots had a good strong sprout on each one, ready for next year's growth. Now, my ranch would be a splendid place for a ginseng-garden; but unless I could be right there every day in the year I do not suppose any kind of fence would keep ginseng-hunters out. The plant the Indian brought me stood up fully two feet high. The leaves had a beautiful glossy surface on the under side, as if they had just been varnished. The plant very much resembles sarsaparilla and some other plants having five leaves radiating from the center; but the ginseng has a very much finer and more delicate appearance than any of these other plants. In answer to my request for a report from some one who did not advertise seeds and plants, I received the following:

GINSENG-GROWING, BY ONE WHO DOES NOT SELL SEEDS OR PLANTS.

You say you would like to hear from some one who is in the ginseng business, who has not plants or seeds to sell. Mr. Benjamin Palmer, of Boydon, Crawford Co., Wis., has been in the business about six years, and he does not sell plants or seeds. I was on his patch last spring, about two-thirds of an acre. You could not tell $\frac{1}{2}$ from the rest of the hillside, except from the fence. The plants had not got up through the leaves yet, but they were there all right, about ten inches apart in the row. I don't know how wide the rows are; but where he raked the leaves off the young plants, I believe you could count a hundred in a foot square, no bigger than a darning-needle. The first ones he planted he says will grow 2 feet high. I suppose they have seeds on them. He says he lost time in not knowing how to manage them at first, or otherwise he would have had more plants. I don't think he cultivated around the plants except to spade around when he planted them. May be they do better that way. They have to be more or less in the shade of the trees. He thinks there is lots of money in the business if a man can hang on for twelve or fifteen years. Woodman, Wis., Oct. 16. JOHN MURRAY.

I believe the big prices for books on the subject have pretty well gone by. The best thing I have found for a small sum of money is one I have mentioned before, by J. W. Sears, of Somerset, Ky. The price is only 10 cents (we can mail them from this office). The high prices for plants and seeds have also come down quite a good deal. In fact, on page 836 you will find seedling plants advertised as low as 3 cents each, and seed-bearing plants for only 12 cents each.

WE SELL YOU DRUGS BY MAIL

and can save you 15 to 75 per cent on every article you select from our Illustrated Drug Book. It contains a list of 15,000 drugs, medicines, family remedies, surgical instruments, sick room appliances, trusses, veterinary preparations, flavoring extracts, paints, oils, etc. Over 1500 illustrations. Quality and purity of every article guaranteed by us. Drug Book costs us \$2 each. We send it for 10 cents—just enough to pay mailing charges. We refund that amount on the first order you send us. Get a copy at once and keep it for reference. You can never tell when you will need help. We are: "The Only Mail Order Drug House in the World."

HELLER CHEMICAL COMPANY, DEPT. 40 CHICAGO, ILLS.

BURPEE'S SEEDS ARE THE BEST THAT CAN BE GROWN

If you want the choicest vegetables or most beautiful flowers you should read **BURPEE'S FARM ANNUAL FOR 1902**,—so well known as the "Leading American Seed Catalogue." It is mailed **FREE to all**. Better send your address **TO-DAY. W. ATLEE BURPEE & CO., PHILADELPHIA.**

SEEDS NURSERY and Florist's line. Direct deal with us will insure you the best and save you money. Mail size postpaid, larger by freight or express, safe arrival and satisfaction guaranteed. Try us. A valuable 168 page Catalog for the asking. 48 years, 1000 acres, 44 greenhouses.

THE STORRS & HARRISON CO.,

Box 156, Painesville, Ohio.

GOOD SEEDS CHEAP

Best in the World.

None so low in price. Largest illustrated seed catalogue ever printed, **FREE**. Engraving of every variety. Price only 1 cent per pkg, and up. A lot of extra packages, rare sorts, presented **FREE** with every order. Send name and address by card or letter.

R. H. SHUMWAY, Rockford, Illinois.

The DEMING

Field Sprayer

for spraying potato plants, strawberry and cotton plants, small nursery stock, etc. The potato-spraying appliance shown in the cut above differs from the usual spraying outfit in that it is inexpensive. The outfit may be placed in the end of any wagon or truck, and a section of hose connected with spray pump. One man can do all the work without waste of material. Our free catalog explains our full line of pumps, sprayers, and treatment for diseases of trees, plants, etc.

THE DEMING COMPANY, SALEM, OHIO.

Western Agents, Henion & Hubbell, Chicago, Ill.

The Storm Proof KING WIND MILL

produces 25 to 50% more net power from any kind of wind than any other mill made. Wheel being only 1 in. thick, cuts the wind like a knife and is 400% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11 Medina, O.

FERRY'S SEEDS

For
**The Farmer
The Gardener
and
The Housewife**

They cost a little more. They are worth a great deal more than the ordinary kind. Sold everywhere. 1902 annual free.

**D. M. FERRY & CO.
Detroit, Mich.**

JUST AS NATURAL as the old hen and a good deal more reliable. Doesn't break its eggs or make its chicks lousy. Doesn't stay off the nest and allow the eggs to chill but hatches every egg that can be hatched.

THE PETALUMA INCUBATOR

is absolutely perfect as to incubator essentials—proper application and distribution of heat and moisture, regulation and ventilation. For 54 to 324 eggs. **WE PAY FREIGHT ANYWHERE** in the U.S. Handsome catalog free. Petaluma Incubator Co., Box 125 Petaluma, Cal.

**200-Egg Incubator
for \$12.80**

Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
GEO. H. STAHL, Quincy, Ill.

FOR SALE.—Will sell cheap, one 10 h. p. engine with upright boiler all complete.
J. W. BITTENBENDER, Knoxville, Iowa.

FANCY EXTRACTED HONEY.—An extra-fine lot of clover honey that I had reserved for bottling, but owing to change of plans will sell in bulk. From combs entirely capped and fully ripened, thick and rich. Now candied perfectly hard and dry. Cans hold 74 lbs. net. Per can, \$5.50. Fancy comb honey, 22 lbs. in case, per case, \$3.30.

J. A. GREEN, Ottawa, Ill.

CALIFORNIA SAGE HONEY.

The world again sweetened with our famous sweet. Bees increasing fast. Bee-men very active. Tons of nectar lost for want of bees to gather. The PACIFIC BEE JOURNAL controls thousands of acres of fine field. Many fields to let. A few bees for sale—and climate too. Four hundred pounds to the colony, twenty tons to the 100 colonies in some instances.

Pacific Bee Journal, Los Angeles, Cal.

\$1 per year; 25c for 3 months' trial; 50c this year and six months of 1902; \$1 for this year and all of 1902; with Gleanings, \$1.25 a year.

Listen, Bee-keepers!

The Lone Star Apiarist

A new bee-journal in the great Southwest, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world, even superior to the great alfalfa regions, as already, with the many flowing wells, comes the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now. The Apiarist is not only for the South, but for all of America, and foreign countries too. Address

HELLER CHEMICAL CO., Dept. 40 Chicago, Ill.

WANTED

No more A B C of Bee Culture and 1888 and 1895 editions. Over one hundred responses have been received in answer to an advertisement in last issue.

BUSINESS AT THIS DATE.

We never in all our experience had so many carload orders booked ahead as at the present time. They have been coming in so much faster than we have been shipping that we were twenty cars behind a few days ago. We have shipped five or six the past week, and should get 12 to 15 more off this month. We did not get the catalog completed before we had to go to press with this issue, but it will be completed immediately after.

HONEY FOR SALE.

We are having a fair trade in honey, both comb and extracted; but with the stock on hand we could handle more orders to advantage. We shall be pleased to hear from those in need of honey, either comb or extracted. In spite of what some of the papers are saying about us, and about adulterated comb honey, we guarantee the honey we furnish to be pure bees' honey, and we stand ready to make good our guarantee, issued more than ten years ago, to pay one thousand dollars for a pound of manufactured comb honey (made at a "factory" where such stuff is made), filled and capped without the aid of the bees.

Special Notices by A. I. Root.

Our abbreviated price list of garden seeds, etc., was crowded out of this issue, but it will be in the next.

THE TRAP NEST—A NEW USE FOR IT.

The vendors of the various trap nests claim a great deal for them; but there is one thing I think they have overlooked. A few days ago Mrs. Root found the trap nest shut; but instead of a hen inside of it there was a *big fat opossum*. He was foraging for eggs and I suppose he thought that, if he squeezed into the nest, he could in like manner *squeeze out*. But he discovered too late that the thing did not work "both ways." He had been for some time getting my eggs.

ONIONS—STARTING THEM IN HOT-BEDS AND COLD-FRAMES FOR TRANSPLANTING IN THE OPEN FIELD.

There is one advantage in this method of working that I think has never been mentioned. It is this: If you sow seed that is a year old or more you do not know whether it will come up or not, nor how perfect a stand it will make, even if some of it does come up. But if you plant this old seed under glass, and grow plants, you can take the plants, few or many; and get a perfect stand by transplanting. We have a few pounds of almost all the kinds of seed we advertise, which we will sell at half price, to be used for planting under glass. It *may* grow just as well as any seed—in fact, it usually does when it is not more than a year old; but, of course, we would not want to sell it without saying that it is last year's seed left over. New seed of Yellow Globe Danvers and Red Wethersfield is 75c per pound, so this old seed will be only 37½ cts. If you wish to sow it under glass it will be time pretty soon to get it started, especially if you want to catch the early market and get a big price for your new onions. Onions, like potatoes, are now "way up," as you may have noticed.

THE GIANT GIBRALTAR ONION ONCE MORE.

The big onion I mentioned on page 961, Dec. 1, is still on my table, perfectly sound and firm, not even a sign of a sprout. This has been all this time in a warmed-up office 70 degrees, and sometimes more. Now, if these onions will keep like this until the 1st of January, even in a hot room, there is a small goldmine in starting these onions under glass, and planting them out in the open ground. Here is what Tusko Greiner says about them in a recent number of the *Farm and Fireside*:

H. L. of Millersburg, Ohio, says: "I must thank you for your article on Gibraltar and Prizetaker onions. I bought this year a package of the Gibraltar onion, sowed in a hot-bed, and transplanted, and gathered three bushels of the finest onions I ever saw. The Prizetaker did not do so well. I shall try onions on a larger scale in 1902." I can only urge my friends to grow more, and as emphatically as ever, to make a trial with these fine sweet Spanish onions, and of the new (transplanting) method of growing them. If done with reasonable care, such trial will prove highly satisfactory. I grow the Gibraltar for early sales and for table pleasures during the earlier part of the fall and winter. The Prizetaker onions, large, but not reaching the extraordinary size of the Gibraltars, are far better keepers, and I must have them to be on hand during the latter part of the winter and up to spring. So I want both kinds, and I believe you will too when you have learned all their good points.

THE NEW HAND POTATO-PLANTER.

Last year we sold several hundred of these new planters; and although I have asked for reports as to how they answered the purpose in different localities, very few have come to hand. In the Traverse region they are almost if not quite the only tool used for planting potatoes, and everybody succeeds with them. Almost every man or boy who come across handles these potato-planters as handily as he would an ax. But here on our own premises there was a prejudice against them, and only one or two of our boys persevered with them long enough to get the hang of the tool. One great trouble is, our clay soil is seldom soft and fine enough to get the planter down a sufficient depth; but even if you have to make a furrow, an expert with the machine will put the pieces in the furrow much faster and more accurately than he could by any other method. Now, I wish you who have these tools would tell me briefly how you like them. I do not wish to sell any thing, much less *recommend* any thing that is not a real benefit to the purchaser. Just put it on a postal when you are writing us, or add a postscript to your letter.

One Dollar Does the Work of \$2.00.

We call attention to prominent advertisement of The Ohio Farmer in this issue under this heading. It interests every farmer.

A New Game.

A new guessing game is to show some illustration, or give a name, either of them made familiar through advertising, and guess who uses the illustration, or what line of goods is handled by the advertisers named. If one were to mention the name, *Shumway*, almost every one would say at once, "Seeds," so thoroughly have the two been advertised for more than thirty years. Mr. Shumway's announcement appears elsewhere in this issue, and is headed "Good Seeds Cheap." It contains a special offer, and mentions his new catalog. Write for it to day. Address R. H. SHUMWAY, Rockford, Ill., and mention this paper.

Seed Time and Harvest.

A good time to think most seriously of the harvest is seed time. The decision you make then will determine the value of your crops later. The growing competition in seed-selling is an increasing temptation to unscrupulous dealers to make extravagant claims for their seeds, both in price and producing qualities. The wisest farmers are those who are influenced most by what experience has proven to be good and true. Thousands of seed-sowers in all sections of the country sow Ferry's famous seeds year after year, and have the satisfaction of good harvests to justify their continued faith in the Ferry firm. They pay a few cents more at seed time, but realize many dollars in better crops at the harvest. The natural consequence of this confidence is an ever increasing business. D. M. Ferry & Co. sent out last year more seeds than any other seed-house in the world. The 1902 catalog of this house is now ready and will be found a useful guide in selecting the choicest seeds for the farmer, the truck-gardener, and the flower-gardener. It is sent free, on request. Address D. M. Ferry & Co., Detroit, Mich., and mention *Gleanings in Bee Culture* when you write them.

Kind Words from our Customers.

Don't stop *GLEANINGS* until I so order. The old gentleman's Home Talks are worth the price of the paper many times over. S. AVARD.
Leesville, La., Dec. 23

I noticed in GLEANINGS a few weeks back where some of the friends were inclined to roast A. I. R. for his Home Talks. Keep them coming, Mr. R. Your Home Papers are fire, and I enjoy them the very best all through. I am no Christian, and seldom go to church; but they are better than a sermon from a college graduate, as they come from a true Christian heart, in my estimation. When I stop GLEANINGS, it will be when I have not the \$1.00, not for their sermons on righteousness, even though a bee-journal.

Centralia, Wash., Nov. 27.

A SUBSCRIBER.

THE GERMAN WAX-PRESS

For over twenty years past I have had to render up old combs or cappings in larger or smaller quantities, and my experience has been extensive, for I have tried faithfully almost every known method to get all the wax out, but have never succeeded to my satisfaction until recently. I got of you a German wax-press, that comes nearer accomplishing that object than anything I have ever tried. I am more than satisfied with it, for, if used according to directions, there is little if any wax left in the refuse. Any one used to the old methods will be astonished at the results obtained. In this press you have given those in need of it the best thing, to my mind, you have ever brought out, and I really believe all who try it will pronounce it a real treasure. There are other points of advantage that I could mention, one of which is its perfect safety—no boiling over and setting fire to every thing, and it can be left alone without care for quite a time, and every thing can be kept neat and clean, and it occupies very little room.

E. T. FLANAGAN.

Belleville, Ill., Dec. 12

CONVENTION NOTICES.

The Wisconsin State Bee-keepers' Association will hold its annual convention in the State Capitol at Madison, Feb. 5 and 6, 1902. The convention promises to be largely attended. Excursion rates of 1½ fare, good for all of the first week in February. All are invited to attend.

ADA L. PICKARD, Secretary.

N. E. FRANCE, President.

The California State Beekeepers' Association will hold its annual convention at the Chamber of Commerce, Los Angeles, on Jan. 15 and 16, 1902. We will try to have a good program. Come, and exchange your bright ideas with your neighbors, and get some of the moss rubbed off your back.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must say you want your advt. in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax. O. H. HYATT, Shenandoah, Iowa.

WANTED.—To exchange a Columbia talking-machine with 15 records, and gen'l mdse., for bee-supplies or empty worker-combs in Hoffman frames; also want to buy some bees, but must be cheap and near here. PRESTON STORE & PRODUCE CO.,

Dority, W. Va.

WANTED.—A buyer for my 80-acre tract of land in Crawford Co., Mo., at \$10.00 per acre, one-half cash; balance on time payment. Address

LOUIS WERNER, Edwardsville, Ills.

WANTED.—To exchange a National cash register, check printer, in first-class condition, for bees. GEO. SHIBER, Franklin, N. Y.

WANTED.—To buy a second-hand saw mill, heavy (top and bottom saw). 216 Court St., Reading, Pa.

WANTED.—To exchange 50 T supers, mostly unused; 25 section-holder supers, unused; 25 second-hand supers, 25 eight-frame hive-bodies, many new; 100-egg incubator and brooder, 10-in. fdn. mill, Novice extractor, Porter bee-escapes, all-zinc honey-boards, queen and drone traps, zinc-perforator for making queen-excluding zinc, greenhouse or hotbed sash, made up or in flat; a large quantity of 8x10 glass, also odd sizes. Send for prices. Wanted—queens, honey, wax, St. Bernard dog, or offers. J. A. GREEN, Ottawa, Ill.

WANTED.—To sell or exchange a cranberry meadow especially located for cultivation, combining essential facilities necessary for control, and 25 years practical testing with excellent success, yielding constantly 5 to 100 per cent on \$100,000, computed on genuine experience. H. A. LORY, Day, Minn.

WANTED.—To exchange 160 acres heavy timbered hardwood land in N. E. Ark. First-class corn, cotton, clover, and fruit land; foothills of the Ozarks; 6 miles from railroad; for suburban home with small orchard, in middle Eastern State. Tell what you have. J. E. DART, Connesauga, Ga.

WANTED.—Good extracted honey. Any kind of cans, so price is right.

W. S. RITCHIE, Corona, Calif.

WANTED.—To sell 14¼-acre farm, 40 acres in cultivation, two good springs, \$700; 15 head cattle, \$150; 17 sheep, \$25; 5 English Berkshire hogs, \$15; 24 colonies bees in 8-frame hives, \$60. Will take \$50 for the lot, all cash, or will sell farm alone. Good bee-range, mild climate, 7 miles from town of Fordyce. Reason for selling and further particulars given on application. D. R. FEASTER, Fordyce, Ark.

WANTED.—To sell one-half interest in a paying bee-business, 3000 colonies.

R. T. STINNETT, Mesilla Park, N. M.

WANTED.—To sell a two-basket Ferris wax-extractor, or, one extra basket, nearly new, for \$8.00; regular price, \$12.00. We can guarantee this machine to be in good order, and at the price we offer it, it is a bargain. THE A. I. ROOT CO., Medina, O'io.

WANTED.—Fifty to 100 colonies bees, March or April; South preferred, near Brunswick or New Orleans. I. J. STRINGHAM, 105 Park Pl., New York.

WANTED.—To sell three apiaries, permanently located, with good honey-house; 3 extractors and super-combs complete; 285 colonies in chaff hives and packing-boxes, located west of Ithaca, N. Y.

W. L. Coggsall, West Groton, N. Y.

WANTED.—To sell Rocky Ford cantaloupe seed. Seed of these famous melons postpaid, 40 cts per pound. Choice selected stock.

H. F. HAGEN, Rocky Ford, Colorado.

WANTED.—A good reliable man to take half interest with me in second apiary; must have the necessary cash, say \$300, and be well acquainted with the bee-business. Address W. S. COOPER,

202 Navarro St., San Antonio, Texas.

WANTED.—Position as bee-keeper, South or West; long experience and good reference. Address GEO. N. MOBLEY, Walker, Mo.

WANTED.—To sell or exchange 200 Hoffman frames filled with combs; also Dovetailed hive-bodies, bees, and fixtures, and two dozen Persian pea-fowls—a bargain. B. J. Cross, Cherokee, Alabama.

WANTED.—To sell or exchange gasoline-engines for all purposes—stationary, marine, bicycle, etc.; want machinery of all kinds.

Robert B. Gedy, LaSalle, Ill.

WANTED.—A dovetailing machine for making hive-bodies; also a two-frame Cowan honey-extractor.

W. N. CANNON, Greenville, Ala.

WANTED.—To sell or exchange three saw benches with saws (\$15 each), one ditto (\$20), machines for boring, matching, sanding, dovetailing, and press-cutting (\$5 to \$15 each), leather belting, shafting, pulleys, etc., at half price; all in good running order; will take honey or offers; will take 10 per cent less for cash. Write. C. W. COSTELLO, Salford, Maine.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I've bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally,

J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per doz. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per doz. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldens, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of *The Southland Queen*, the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

**THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.**

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.

Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm ly attached to all four sides, the combs unsoiled by travel-ling or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

SAN FRANCISCO.—Comb honey, 10@12½; extracted, water-white, 6@½; light amber, 1@5½; dark, 3@4@½. Beeswax, 20@28.

Dec. 25. E. H. SCHAEFFLE, Murphys, Calif.

SCHENECTADY.—Our market has been very quiet since the holidays, especially comb honey, the demand being principally for buckwheat. There is quite a demand for extracted, and stock on hand is limited. No change in prices from our last

Jan. 8. CHAS. MCCULLOCH,
1 Eagle St., Schenectady, N. Y.

COLUMBUS.—Fancy white comb, 17; No. 1, 16; fancy amber, 14; No. 1, 13. EVANS & TURNER,
Jan. 7.

TORONTO.—Extracted honey is selling at about 9 cts. per lb., comb as follows: Fancy \$2.25 a doz.; A No. 1, \$2.00. M. MOYER & SON.
Dec. 23.

MILWAUKEE.—The market for honey is without any special features of interest to note. The demand for honey is not large. The supply is fair; the supply of fancy section should be increased, and we encourage all shippers of such. We quote fancy 1-lb. sections, 15 @16; A No. 1, 14@15; No. 1, 13@14; amber nominal 12 @14. Extracted in bbls, kegs, or cans, white, 8@9; dark, 5@7½. Beeswax, 26@28.

A. V. BISHOP & Co.,
Jan. 7. 119 Buffalo St., Milwaukee, Wis.

ALBANY.—Honey market quiet, with light stock and light receipts. Improved demand for buckwheat and dark grades of extracted, but light demand for light-colored. MACDOUGAL & Co.,
Jan. 3. 380 Broadway, Albany, N. Y.

BOSTON.—Comb honey is in good supply, and not working off as well as we would like to see at this time of the year. Prices are ranging as follows: Strictly No. 1, 15@15½; No. 2, 14. Extracted, white, 7@7½; light amber, 6½.

BLAKE, SCOTT & LEE,
Jan. 4. 31, 33 Commercial St., Boston, Mass.

DENVER.—No. 1 white comb honey, \$2.75 to \$3.00 per case of 24 sections; No. 2, \$2.50 to \$2.65. Extracted, 7@8. Beeswax, 22@26.

COLORADO HONEY-PRODUCERS' ASS'N.
Jan. 8. 1440 Market St., Denver, Col.

CINCINNATI.—The demand for honey is fair. Extracted honey is offered very freely. Dark brings 5; lighter, 5½@6; fancy, 6½@7½. Fancy comb, 15; lower grades, 12½@13½. C. H. W. WEBER,
Jan. 7. 2146 Central Ave., Cincinnati, Ohio.

NEW YORK.—Comb honey continues in good demand, with supplies pretty well exhausted. We quote fancy white, 15; No. 1 white, 14; No. 2, 13; amber, 12; dark, 10@11. Extracted, dull, with large supplies, and quotations on large lots are generally shaded in order to effect sales. We quote white, 6½@7; amber, 5½@6; dark, 5@5½. Beeswax firm, and rather scarce at 28@28½.

HILDRETH & SEGELKEN,
Jan. 9. 82, 84 Murray St., New York City.

NEW YORK.—Demand for comb honey is quiet after the holidays. Supply light; a little demand for extracted, particularly buckwheat, of which there is a meager supply. We quote the market to-day as follows: Fancy white, 15@16; A No. 1 white, 14@15; No. 1 white, 13@14; No. 2, 11@12; fancy buckwheat, 11@12; No. 1 buckwheat, 10@11; No. 2 buckwheat, 9@10; white clover and basswood extracted, 6½@7; light amber, 6 @6½; amber and buckwheat, 5½@6. Beeswax, 27@29.

CHAS. ISRAEL & BROS.,
Jan. 8. 486-490 Canal St., New York City.

BUFFALO.—Below I quote you the honey market as it is now. Fancy white comb, 15@16; A No. 1, 14@15; No. 1, 13@14; No. 2, 12@13; No. 3, 11@12; dark, 10@11. Extracted white, 6½@7; dark, 5@5½. Beeswax, yellow, 28@30; dark, 23@25. W. C. TOWNSEND,
Jan. 13. 84, 86 W. Market St., Buffalo, N. Y.

DETROIT.—Fancy white comb honey, 15; No. 1, 14; dark and amber, 11@13; extracted, white, 7@7½; dark and amber, 5@6½; beeswax, 26@27.

M. H. HUNT & SON,
Jan. 13. Bell Branch, Mich.

PHILADELPHIA.—Market on honey has been a little quiet since Christmas; supply has been equal to the demand. We quote fancy comb, 16; No. 1, 15. Fancy extracted, white, 8; amber, 7. Beeswax, 28. We are producers of honey—do not handle on commission.

WM. A. SELSER,
Jan. 10. 10 Vine St., Philadelphia, Pa.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station. THOS. C. STANLEY & SON, Fairfield, Ill.

Satisfied Customers,

and their numerous expressions of the superiority of my queens warrant me in continuing the arrangement of my queen apiaries in 1902 as in 1901. I have watched carefully, and have selected the queens whose colonies gave me the best results in HONEY, for my queen and drone mothers.

Yard No. 1 consists of a combination of the **Root Long-Tongued Clover Stock**, the **Superior Stock** so much Advertised by Hutchinson, and a **Selection of My Own Stock** that I have been Breeding for years, in regard to which I have the following:

Buffalo, N. Y., Aug. 31, 1901.

My Dear Victor:—Queen and nucleus arrived safely yesterday; made entrance to nucleus and allowed them to fly yesterday. Transferred them to a Dovetailed hive this morning, *without smoke, and handled them, patting them on the back*, and I never saw such quiet and docile bees. If their working qualities are as superior as their handling, I am prepared to say you have the best bees I have ever met with, which would include some 25 or 30 different breeders, and all the well-known races.

Yours very truly,

OREL L. HERSHISER.

The colony of one of the queens I have selected for a breeder in this yard gathered right about 400 pounds of honey last season. I have not measured her bees' tongues, but they are ALL RIGHT, LONG OR SHORT.

Yard No. 2 consists of imported Italians, daughters and granddaughters. For further description see ad. later. Testimonials on application.

Yard No. 3—GOLDEN BEAUTIES or 5-banded Italians.

I am now booking orders for spring delivery; first come first served.

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

W. O. VICTOR, Queen Specialist. Wharton. Wharton Co., Texas.

California.

The State that produces carloads of honey; the largest averages of any State in the Union; a mammoth honey association to market the crop; the value of different fields, is told in the

Pacific Bee Journal,

Los Angeles, Calif.,

whose correspondents are successful producers of tons and tons—20 to 80 tons each.

California as a Honey State, by A. J. Cook. Gallup's Bee-keeping Experiences. Nevada Forging Ahead. Utah Bee-keeping. Washington, Oregon, Idaho, and Arizona News. Bee-keepers say the Pacific is one of the best \$1.00 bee-papers, prettily gotten up and illustrated; most appropriate cover design.

Clubbed with GLEANINGS, new or renewal, \$1.00 a year. Grand club with GLEANINGS and Rocky Mountain Bee Journal, \$1.25 a year.

The Pacific Bee Journal, Los Angeles, Calif.

237 East Fourth Street.

"Colorado's Characteristics; the Advantages of Irrigation; and how Western Bee-keeping Differs from that of the East," is the title of a six-page editorial in the Jan. issue of the Bee-keepers' Review.

The editor spent nearly two weeks, last November, with his camera, among the bee-keepers of Colorado; and this "write-up" is the result. It is illustrated by several pictures taken by the editor, showing the mountains, alfalfa fields, "ricks" of alfalfa hay, herds of cattle, apiaries, hives, etc. Mr. M. A. Gill, who, last year, managed 700 colonies in Colorado, producing two carloads of comb honey, begins a series of articles in this issue. His first article is on "Hive-covers," and is the best of anything that has yet appeared on that subject.

Send ten cents for this issue, and with it will be sent two other late but different issues. A coupon will be sent entitling the holder to the Review one year for only 90 cts.

With these copies of the Review will be sent an offer whereby 12 back numbers of the Review may be secured *entirely free*; and the first few who accept this offer will get, as those 12 back numbers, the volume for 1901 complete.

1902 now on hand. I am The Root Com-
pany's representative for Cincinnati and sur-
rounding territories. . . You save TIME
and FREIGHT CHARGES by having goods
shipped from here. Convenience of railroad
facilities here enables me to do so. Before
buying elsewhere, write for my prices and
catalog, which will be mailed you free of
charge.

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS. ILLUSTRATED SEMI-MONTHLY Published by THE A. ROOT CO. MEDINA, OHIO. \$1.00 PER YEAR

VOL. XXX.

JAN. 15, 1902.

No. 2.

"BOILING HONEY will obviously spoil it for vinegar," says the editor of *British Bee Journal*.

THE LENGTH of English words is less than you might suppose. In the nine verses of the beatitudes, Matthew 5, the average length of the words is a little less than $4\frac{1}{2}$ letters each. In ordinary language, as in the pages of *GLEANINGS*, the words are still shorter.

PROPOLOSIN is very highly spoken of in *Deutsche Illus. Bztg.*, Editor Gravenhorst saying he has been astonished at the results of its use in different wounds and sores. It is also said that, if the hands are rubbed with propolis, they will not be stung by the bees.

THE ILLUSTRIRTE MONATSBLAETTER says Reidenbach finds the weight of 30 bees' eggs to be 5 milligrams; and that Cook, in 1891, in *GLEANINGS*, published 3.9 milligrams as the weight of 30 eggs (I don't succeed in finding it in *GLEANINGS*); and then asks which is right.

TO DETECT adulteration in wax, the *Schleswig-Holst. Bztg.* says to burn a piece on hot iron. If a pleasant smell arises, the wax is pure. If it is impure there will arise a disagreeable, fatty, white smoke. Burn a piece that you know is pure, and then compare the suspected article by burning.

P. SCHACHINGER, in *Oest. Bztg.*, gives this: A cluster of bees were hanging under an alighting-board, only two of the number clinging to the board, the rest hanging to these two bees. The little cluster was taken off and counted, and was found to number 64. So each of the two bees supported 32 times its own weight!

I AM ASKED how much acid I used in syrup of 5 sugar to 2 water. An even teaspoonful of tartaric acid to every 20 lbs. of

sugar. Dissolve acid in a little water, and stir into the syrup about the time the sugar is dissolved. But I'd much rather feed early enough to have equal parts sugar and water, and leave the acid out. [So would I.—Ed.]

WHEN I have forced a very young bee to sting me, I have been surprised at the mildness of the sting. So I am not surprised that Dr. Langer reports the amount of poison carried by a nurse-bee to be .00015 of a gram, while that of a field bee was twice as much, ranging from .00025 to .00035. [Sometimes the sting of a worker right from the fields is so painful that I feel like groaning—yes, and I do groan—with pain. I am quite prepared to believe that the fielders have twice the amount of poison in their poison-sacs that the home bees have.—Ed.]

W. E. FLOWER reports in *Review* that he succeeded in getting one queen mated in a tent $12 \times 10 \times 6$. That's hopeful—not because of the large number of successes, but because a tent of that size is within easy reach; and if he succeeded in one case he may learn the trick of succeeding always. Keep on, Bro. Flower! [This is the very experiment I had contemplated having tried at our own apiary the past summer; but absence from home, and general pressure of work, precluded carrying it out. I must say I am very hopeful; for, as has been already said, if we are to bring about improvements in our breeding stock we must control the selection of the males as well as of the females; and the tent plan is often the only feasible one for the average queen-breeder to carry out. An island in a body of water is, of course, feasible to those who are on such an island, providing the drones from only one queen are allowed to fly on that island.—Ed.]

ONE of the things that I can't understand, although I must believe it, is that length and reach of tongue have no fixed relation to each other. Prof. Gillette's measurements show six times as much variation in reach as in length, and in at least one case two tongues can be found in which the shorter tongue has the longer reach.

[If this is true, and I believe it is, then the experiment of Mr. Doolittle regarding those four colonies wherein the shortest-tongued bees gathered the most honey proves nothing. Prof. Gillette's measurements of those bees were for tongue *length*—or at least that is so reported in Doolittle's article. It is possible and even probable that those short-tongued bees were not really short but long reach bees. This only emphasizes the fact that tongue measurement ought to be confined to tongue reach, and that by some sort of glossometer that will give the measurements for a whole colony and not for a few bees.—ED.]

THE UNCAPPING-FORK, heretofore, has been mentioned only in terms of praise. Now *L'Abeille* seems to prefer the knife, because with it inequalities of the surface may be cut down so as to make the combs of uniform thickness, and the knife is also needed to remove burr-combs. [While on my western tour I saw considerable extracting in a wholesale way, and I am very sure that the fork could not be used in place of the knife. It is the general practice to space the combs in supers $1\frac{1}{2}$ to $1\frac{3}{4}$ from center to center. This, of course, makes very thick extracting-combs. They are then sliced down to from $\frac{7}{8}$ to one inch in thickness, leaving sharp clean-edged cells so that nearly all the honey can readily flow out by centrifugal force. But from the experience I have had with forks, combs, and brushes, I could do no better than to make the edges of the cells very ragged. The result would be that it would be very difficult to throw the honey out of them, especially when many cells are only partly opened.—ED.]

YOU WANT ME, Mr. Editor, to make war against what was formerly ungrammatical but is now accepted as good usage. Not I. When a thing becomes accepted as good usage it is grammatical, and I don't propose to fight grammatical expressions. I've no call to go back to past generations and fight them for admitting some words and usages into good society that possibly ought not to have been admitted. I've more than I can do to fight stubborn editors that will insist in defending expressions that are not now grammatical, never have been grammatical, and I hope never will be grammatical. Now are you "shook" enough? ["Nixie." But say; how can a word be grammatical when it violates all present rules of grammar? Accepted usage may give a word respectability in literature; but how could it make it grammatical, present or future, if it was not so in the present or past? I suppose this is one of the things we shall have to fight out when we get together.—ED.]

REIDENBACH, according to *Leipzig. Bztg.*, has been making some very careful investigations as to the comparative size of cells in new and old combs. Like others, he finds the cell-walls remain thin, although in very old comb the septum may be $\frac{1}{8}$ to $\frac{1}{4}$

inch thick. To get at the contents of the cells, a novel plan was used, although a very common-sense one. He carefully measured the amount of water each cell would contain. A cell in freshly built natural worker comb he found to contain .28 cubic centimeter, yet on the edge of new comb out of which brood had already emerged he found cells containing only .20. In old combs with septum $\frac{1}{8}$ to $\frac{1}{4}$ inch thick, the contents never fell below .20, but in most cases the measurement was .25. [In other words, there is scientific proof to show that the diameter of the cells of honey-comb does not become less through age. We have known, however, that the depth of the cells varied; but this does not make shorter bees, because the cells at the start are longer than is necessary. As I have before stated, Nature would not make such a tremendous blunder as to make smaller bees. All species have a tendency to remain the same size.—ED.]

I ARISE to remark that "in this locality" no stock whatever is taken in the belief that length of tongue is a mere incident in red-clover queens. It's an essential of the most essential character. You may have all the other characteristics you like, and if you haven't length of tongue you'll never get the nectar out of red clover. Just tell me, if you please, Mr. Editor, how you're ever going to get the nectar out of the bottom of a 20-hundredth tube with a 19-hundredth tongue reach. [You can not, of course; but if one colony would gather twice as much honey as another one whose bees had longer reach, then I would take those bees that got the honey *somehow*. Suppose here is a colony whose bees have an average tongue reach of .19; and suppose, again, that one-half of all the corollatubes of the red clover in the field are .20 deep and over. Is it not possible that the .19 reach of bees might get all the nectar from the tubes .19 and under, while the .20 reach bees would get only one quarter of the honey available to them. I still think that length of tongue should be considered of secondary importance, and that the ability to get honey *by some means* should be the first consideration.—ED.]

Blu-tering storms with chilling breath
Howl around the door;
Winter comes with all his hosts
From the icy arctic shore.

BRITISH BEE JOURNAL.

Quoting from *Science Siftings* we learn:

Few people know that honey possesses great value as a food on account of its ease of digestion; for which reason it is especially desirable for those with weak-

ened digestive powers. The nectar of flowers is almost entirely cane sugar. The secretions added by the bees change this to grape sugar, and so prepare it that it is almost ready for assimilation without any effort on the part of the stomach. The unpleasant symptoms from which some suffer after a surfeit of honey may often be removed by drinking a little milk.

Mr. Cowan says:

Not since the appearance, in 1876, of Buechner's "Mind in Animals" have we had a book about bees more charming, or one that we have read with greater pleasure, than Maeterlinck's "Life of the Bee."

In speaking of sections of honey weighing less than 16 ounces, a writer says:

Society righteously brands such weights with even a stronger and harsher name. I trust that, whatever innovations may be introduced, a pound section may be made to weigh the full number of ounces.

If it is a pound section, why bother about the weight? But as bees don't know that 16 ounces make a pound, we shall have to take sections as they come, and sell them at so much apiece, saying nothing about the weight. A vender of very cold "hot" cakes excused himself by saying, "I didn't mean they were 'ot. 'Ot is just the name of 'em." If "pound" is "just the name of 'em," perhaps we'd better change the name, leaving off all reference to weight.

The editor quotes the following from *Answers* of Nov. 30:

The purchaser of honey vainly imagines that swindling is impossible if frame honey is bought. The fact is that clever bee-keepers now make perfect imitation combs out of paraffine wax, and put these into the hives for the bees to fill and seal. To test it, pour a drop or two of sulphuric acid upon the comb which is on trial. Good beeswax will char and blacken under the acid, but upon paraffine no effect will be perceptible.

The only strange thing about the above is that the *British Bee Journal* lets it go as if it were an undoubted fact, making no reply. It did not take pains to say that such combs can not be made by man, and that they would melt down by the heat of the hives, even if man could make them. A failure to do this is as bad as to publish the canard. The general reader would take it as a piece of common news.

AMERICAN BEE JOURNAL.

In speaking of the benefits of co-operation among bee-keepers and the agricultural classes generally, Prof. Cook relates the following, and his words contain a volume:

The Citrus Fruit Exchange of Southern California has now been in operation for over seven years, and has been an eminent success. These are the things which it has done: Greatly lessened the expenses in preparing to ship; secured a more perfect grading of the fruit; employed salaried agents of their own in all the leading cities; developed new markets in the East; with surprising success distributed the fruits in the East with such skill as to prevent overcrowding or ruinous competition, and at the same time keeping all the market supplied; doing all their business at an expense of less than three per cent, and, though the goods marketed bring in millions of dollars each year, they have met with almost no loss at all—less than one-eightieth of one per cent during all their years of business. The receipts of their business the past year have been over eight millions of dollars, and yet there has been no loss at all. This is only one of several years with a similar record.

AIKIN'S HONEY AND WAX SEPARATOR.

A Valuable Adjunct to the Solar Wax-extractor.

BY R. C. AIKIN.

About three or four years ago I conceived the idea of an attachment to wax-extractors to separate the honey and wax. The old way of letting the honey and wax run into one common pan or tank had several objections that I longed to get rid of, and, having solved the problem in a very satisfactory way, I now propose to publish the results of my cogitations and experimenting. The device, while having more properly its place with the solar, may be made to answer the same purpose for which it was invented, in connection with wax-extractors of other kinds. I have no extractor but the solar,

FIG. 1.

hence have not used it with any other kind, but the principle may be applied to others.

The principle upon which this device works is specific gravity. Honey weighs 12 lbs. to the gallon, and water about 8 lbs. I do not know what is the weight of beeswax, but I know what every apiarist does—that wax is lighter than water. It is immaterial as to the exact proportion, so we will call it 8 for wax and 12 for honey.

FIG. 2.

Now, suppose you take a cake of wax 3 inches thick and put it into a bucket of honey or into a tank where the wax has plenty of room so it does not touch the bucket or tank in any way that will interfere with its

floating, and the wax will stand one inch above the surface of the honey. You see it is just a matter of weight; 2 parts of the honey are as heavy as 3 parts of the wax, hence the wax carries its surface clear above the honey, just as a cork floats a considerable part of its bulk above water. It matters not whether the wax is liquid or solid. It is bound to float just the same. A third of its depth will stand above the honey, and the rest will be submerged.

Now look at Fig. 1. This represents the separator as it appears in a general outline view. This is placed under the drip, as it runs from the pan supporting the mixture of wax and honey-cappings, broken or any kind of comb. The first to flow from the melting combs will be honey, dropping into the separator at A, the larger of the two compartments. The partition between these compartments does not reach quite to the bottom by about $\frac{1}{2}$ inch, hence the honey will pass under and rise in both compartments alike.

Look at the outlet for honey, and you will see that it is deeper from the top than the wax-outlet; and so when the honey rises to the opening it flows out, and will continue to flow as long as it pours into the other compartment, passing under the partition. The wax will begin to come shortly, and, being so much lighter than the honey, will begin to rise or pile up in compartment A. No matter what amount of wax falls into the honey, it keeps rising above and settling below the level of the honey-outlet; $\frac{1}{3}$ the depth of the body of wax is above and $\frac{2}{3}$ below; thus it increases until it flows out at its own overflow-outlet, and thereafter maintains its position, becoming neither deeper nor shallower. As long as wax and honey continue to flow in, the wax floats in its own compartment; and the honey, being so much heavier, sinks right through the wax and comes up and out at its own level. If wax stops coming, that body of wax in compartment A just remains as it is, neither less nor more, and honey may pour in all day, but will pass through and out at its own door; and, likewise, should honey stop coming, but wax continue to flow, the honey in the separator remains stationary, and the wax overflows into its own place. There is no limit; the two must separate and flow their own way when they come into the separator, whether it is tons or pounds.

There should be a check or dam to keep back the slumgum that would wash down into the separator. There is always more or less of sediment that will get down; but if the cocoons and more bulky foreign matter are kept back the fine sediment will be found accumulated between the honey and wax; and when the remnant of wax cools and is removed the sediment comes with it.

This little contrivance I count as a valuable adjunct to any solar, and may be used to advantage in many places. I have made my solar with one end for all sorts of trashy combs, and the other end for melting cappings, candied sections, new broken combs,

and any clean combs that may contain honey suitable for table use that can not well be separated in the extractor. Cappings or broken combs placed in the solar will very soon release the honey and let it run into the separator, and from there it will soon be in a tank or receptacle underneath, and away from the heat and light. I have sold many hundred pounds for table use that has been through the solar and separator. The fact is, the separator is a sort of strainer, acting on the specific-gravity plan, and does its work when the honey is quite warm and thin, so that it separates freely, the impurities floating up next to the wax. This idea of a strainer has been published in this journal, but I do not take the time to hunt up when or by whom.

For cooling and caking the wax, I use the Rauchfuss idea of a series of small pans with an overflow from one to the other. The Root Co. is now putting out the same thing with their solars. The honey, besides being strained by the gravity process in the separator, passes below into a tank, and there, while still warm and thin, goes through another gravity-straining process; and, if not yet satisfactorily done, can be drawn from there and put through cheesecloth or other strainer.

My separator, which has handled about a thousand pounds of wax and over a ton of honey this summer, is very well represented in Fig. 2. The bottom is about 2x7 inches, the top about 6x9, and the depth about 7 inches. There should be at the very least an inch from the bottom of the body of the wax to the bottom of the partition C. That will make sure that neither wax nor sediment gets under to float out with the honey. The flaring shape is to make the wax remnant easily removable when cooled, and to get the necessary depth without having an undue amount of honey in the separator, which must be there all the time. Possibly a much smaller arrangement will do as well; and if so, the honey and wax remnants always left over from one day to the next would be very nominal indeed. I think mine carries less than 2 pounds of wax, and it has handled well nigh 200 pounds in a day—would handle much more if it could be melted and delivered to it. Each morning the wax remnant should be removed and put back to remelt. This keeps the sediment from accumulating. The honey remnant need not be changed for days or weeks.

Brethren, this is a decided success. I feel that I have at last developed at least one invention that will be useful to apiculture. My next article will deal with the construction of solar wax-extractors, pointing out wherein the present construction method is at fault. Like this separator, when you see how to build a solar, you will wonder why you did not think of it before.

[You say this idea of a strainer has been published in this journal before. You probably refer to what is known as the G.

C. Ferris wax-bucket, illustrated and described on page 277 of our issue for April 1, 1901. The principle, however, is not quite the same, or rather, perhaps I should say, you have improved on the Ferris plan by providing two outlets—one for wax and one for honey; and in this connection it should be stated that you use your apparatus in a little different manner. Mr. Ferris aims to clarify the wax, while you go still further, separating the honey from the wax in such a way that both of them, after being separated, are free of impurities.

While you do not say anything about it in your article, I should imagine the same outfit would be very handy during extracting time. Suppose, for instance, the honey from the honey-extractors ran direct into compartment A; wax cappings, dead bees, refuse dirt of every description, would remain in A until the surplus would overflow at the wax-outlet, while the clear nice honey would pass under the partition C, and flow out of the honey-outlet as shown in the diagram.

In our next issue Mr. Aikin will describe his combination solar and artificial-heat wax-extractor. He probably has the largest as well as most elaborate extractor of the kind in the world.—Ed.]

RAMBLE 197.

Bee-keeping in Southern California; Co-operation for the Formation of a Trust of Honey-producers; Advantages and Benefits Explained.

BY RAMBLER.

I found the bee-keepers of Southern California very enthusiastic over the fair yield of honey secured. There is nothing like prosperity to cheer a man up and make him hopeful; and having just emerged from a three-years' drouth it is nothing strange that the reaction should be rather feverish.

During the poor seasons, bee-keepers when in the city were in the habit of browsing for a stray meal now and then in 10 and 15 cent restaurants; but now it was 25 and 50 cent eating-houses. Mr. Brodbeck had dropped his oil business and returned to his first love—had secured a fine yield of honey, and, under the protecting care of a capitalist, was buying whole apiaries. I believe they now have 1000 colonies. Several new men have appeared in the ranks; and if the seasons would change for good ones the future for Southern California would be bright.

I found the *Pacific Bee Journal* blowing its horn lustily again. It even goes so far as to corral the weather for the next decade; but I think the bee-men will continue to look to the Weather Bureau for a good share of their information.

As stated in the previous Ramble, the Shaffner Brothers were managing my bees and their own with success. I herewith present a photo of these enterprising young men in their cosy camp at the Rambler's apiary, with dog, gun, and horse. Arthur is contemplating a slice of bread and honey, while Earl has anticipations toward an apple. The horse also had the same mind, and moved his head. Although this retreat is only ten miles from Los Angeles, there are coyotes, mountain lions, and now and then a deer seen here. Some of the night adventures here would make the average man's hair stand on end.

I found the bee-men also ready to promote any enterprise for the increase of their honey pasturage, and for the irrigation of arid places. A new invention has recently been tried successfully that may work a revolution in irrigation matters in Southern California. This portion of the State has no large rivers to draw from; but there is plenty of water if they dig for it. When found by digging, the next operation is to pump it to the surface, and that is where the new solar engine will play an important part. This engine is run entirely by solar heat—no expense for fuel, and, during the season for irrigating, we have continuous sunshine; and what wonders are performed in this country with water and sunshine!

On page 472 I gave you a photo of an immense eucalyptus-tree of only eleven years' growth. Let me show you one of our beautiful pepper-trees that is also making a rapid growth. This tree was planted in October, 1899. It was then two inches in height, and a mere thread. This photo was taken in November, or a trifle over two years after, and, note the growth! Mrs. May and daughter are very proud of their pepper-tree, and the bees were busy upon those little flowers when the photo was taken.

The hopefulness of the bee-men here has a sort of contagious influence, and I began to be hopeful with the rest; but I have learned that we are not sure of a honey

SHAFFNER BROS. IN CAMP AT RAMBLER'S APIARY.

crop until well into the winter, and after the proper amount of rainfall.

These certain uncertainties have led the Rambler into new fields and into enlarged ideas in respect to bee culture. Let me expound a new doctrine.

In the first place, let me ask why it is that capitalists seldom invest in bees. The answer is upon your tongue—owing to the uncertainties. A capitalist is looking for a sure thing, or an income for the money invested, and hardly ever enters this field unless he becomes an enthusiast about bees.

PEPPER-TREE, TWO YEARS' GROWTH.

I am quite sure the time is ripe for putting the matter of honey production upon a safe financial basis, and so sure of good returns for invested capital that the latter will seek investment. This new combination is a little too large for bee-men to undertake themselves and without capital; but bee-keepers and capitalists can work together in these interests. For instance, let a company be organized upon strictly business principles, with trained business men at the head of it. Let said company own, by purchase, 10,000 colonies of bees in Southern California. As to the management of said bees, according to our present

methods for extracted honey, three men could manage 1000 colonies or more during the busy season, which, in Southern California, lasts from April until July. During the other eight months one man could easily care for over 1000 colonies, except at times when hives should be made or bees moved to new locations; but when apiaries become well established one expert could care for an indefinite number.

We have now established our 10,000 colonies in Southern California. Let us now go to Central California and establish another 10,000 in a series of apiaries. Nearly the same conditions exist in Central California for the actual work in the apiary as in Southern California, with the exception that the honey yield comes later, or July until October. Inasmuch as this is prolonging the honey season to seven months for our company it might be asked, "Why not move the bees from Southern to Central California?" I would oppose several reasons to this:

1. The removal of an apiary abandons the field to others.
2. The expense.
3. An apiary that has just secured a crop of honey would not be fitted for gathering another so soon without requeening and much building-up work.

We have now planted our 20,000 colonies, where, in a good honey season, we shall get a seven-months' flow. Now, in order to fill up the five-months' gap, and make the honey-flow continuous all the year round for our company, let us establish 10,000 colonies in Cuba, where the main flow comes from November to April.

Let us now sum up the advantages. The leading one is the elevation of the industry to a position of certainty. If I own stock in the company I am sure to realize a good percentage, even if there is a failure at one point. If a bee-keeper has put his bees in as stock he is interested in all of the locations; and if his crop fails, another location will bring him a revenue; but when the yield is good in all of the locations his dividend would be no small amount.

Another good feature about this combination is the inducement held out to young men to take up the business as an all-the-year-round and life vocation. At present there is no inducement, for the business in one location is short and uncertain. A skillful bee-keeper (and no others need apply) who puts his bees into the company could secure work the year round.

Then the grading and marketing of honey could be brought to something systematic, and in the hands of skillful managers.

The failure of exchanges and all similar organizations is caused by the narrowness of their operations, and the lack of financial backing. I speak from experience, and experience dearly bought, when I say that associations organized without financial backing will and do result in weak attempts or total failures.

The capitalist must step in with his mon-

ey, and, as I have reason to know, the plan above meets with his approval.

This plan can be organized in California, Texas, and Cuba, or with any other localities that will bring a continuous honey-yield and an unlimited number of colonies. It is in no sense a trust—it is only a broadening of the industry into a safe business proposition. It is not a visionary scheme, for private parties are carrying it out in a smaller way to-day. The Rambler is now in Cuba, looking up the industry; and, although he is but upon the borders of the land, he feels the influence of much sweetness, and hopes, in the next Ramble, to introduce the reader into the "Gem of the Antilles."

OFF FOR CUBA.

[This plan of co-operation, or bee-keepers' trust, is very much like what was advocated by the editor of the *Pacific Bee Journal* a short time ago; but bee-keepers generally did not take kindly to it, I understand, and the scheme fell through in favor of some sort of exchange. Well, now, here we have the Rambler actually advocating the same thing. Of course, he says it is not a trust; but nowadays the meaning of the word has been enlarged to incorporate an aggregation of individuals, corporations, or firms, under one head, forming one mammoth corporation not only controlling but actually owning the former independent concerns. Whether such a plan can be made feasible in the bee-keeping line remains to be seen. There is much to recommend it if bee-keepers will put in their apiaries and equipment as so much stock. Certain it is that *some* controlling force should handle the entire output of the honey for any one State rather than to let the product of a thousand different bee-men go into the market in direct and open competition, resulting in a low level of prices rather than those that would put the business on a profitable basis so that those poor years that are bound to come could be tided over.

The illustration of the pepper-tree is only a fair sample of the wonderful growths that very often take place in California and Arizona. We here in the East would give hundreds of dollars for shade-trees on our front lawns; but in California all one has to do is to set out a cottonwood or a pepper-tree, and in two years' time he has fairly good shade, and in ten years he has a tree of the size of our elms when they are about fifty years old. —ED.]

SHALLOW BROOD-FRAMES.

Localities where the Honey-flow is Scant; Extra-thin Foundation for Sections.

BY J. E. HAND.

"Well, here I am again. I have been doing some hard thinking about this system of contraction and expansion by means of very shallow frames. I am just starting in the bee business, and am very anxious to start right if I can; but I have been looking up this matter of large vs. small hives and deep vs. shallow frames, and I find such a difference of opinion among prominent bee-keepers on these questions that I am more than ever at sea as to what size of frame and hive to adopt."

"Yes, it is true there is a great diversity of opinion on these questions. As on all others, men are differently constituted. What suits one man will not suit another of different temperament. With me it is not simply a matter of like or dislike. There are some things about shallow frames that I don't like, but I am depending on the business for a living for myself and family, and it behooves me to be very careful about this matter. There are locations so good that a fair crop of surplus can be secured with almost any kind of hive, but ours is not one of these. Look around among the bee-keepers of this vicinity. They will tell you that the business is too uncertain, and that it will not do to depend upon bee-keeping for a living. If they do not, their rows of hives that are silent and empty have a language of their own that is more eloquent than words. I do not believe there are more than half as many bees in this county as there were five years ago. It is only by the most careful management and the most approved methods that any one can succeed in such a location as this; and unless a man has a natural love for the business, aside from the dollar-and-cent part of it, he will very soon give up the contest as too unequal, and turn his attention to something that is more certain."

"These are truths that every one must face who has an aspiration to become a honey-producer in such a location as ours."

"In view of these facts, your desire to start right is very commendable."

"Would it not be better for a man who has a natural love for the business to move to a location that is better suited to this occupation—to some of the paradises described in the bee-journals?"

"Well, friend Charles, this is a question that I have thought about a great deal during the past three poor seasons. There are a great many things to be considered in changing to a new location. I have been in some of these paradises, and there are other things to be desired besides securing a large crop of honey. Many of these places are far from market; and unless bee-keepers have an organization to protect themselves they are at the mercy of speculators who will buy their product at their

own price because they can not ship it themselves; and then most of these locations are already overstocked, and strangers will meet with any thing but a hearty welcome. A good accessible market, with a fair to poor honey yield, is more desirable than a good crop that is practically inaccessible to market. This past season has decided that, for me, the proper solution of this problem rests in improved methods, careful management, and in developing the resources already at hand."

"I believe you are on the right track in this matter, and that the main thing is to study thoroughly your location, and then use the methods and appliances that are best suited to that particular location."

"Yes, that is it; or, as Heddon puts it, plant your guns and stay by them. Keep more bees; produce tons instead of pounds. Here is a sample of the foundation that the bees accepted and worked out into such beautiful combs of honey by the feeding-back process. It is the Root thin-base foundation. Here is a section that was on the hive only 12 hours, and at a time when common foundation would be completely destroyed, and here is one that is finished. You see there are no pop-holes in the corners of either of these sections, and this one that has been on the hives only twelve hours has honey in some of the cells."

"Do you fasten the foundation at the sides?"

"No. The pieces are made of a size just to fill the section inside, and will be quickly and firmly attached to the sides as well as at the top; but this one is as firmly attached at the bottom as at the top."

"Oh, yes! I always use a narrow strip of foundation at the bottom of sections. Does not the fence separator have something to do with those well-filled sections?"

"Yes. I am very certain that the free communication afforded by these separators has a tendency to lessen the pop-holes that are such an eyesore to producers of fancy honey, but not so much as does the thin-base foundation; and with the two combined there is nothing further to be desired in this direction."

"What is the cause of these pop-holes, as you call them?"

"Well, I have always thought that the bees made them for passageways; but this last season I have about come to the conclusion that the bees gnaw out the foundation because they don't like it, and afterward are slow to fill up these holes, because they are so handy for passageways. It was this idea that led me to try the thin-base foundation, which, in every case, was accepted the same as natural comb."

"Do you think that a section that is taller than it is wide, or 4x5, will be any better filled than one that is square, or 4½ x 4½?"

"No. Other things being equal, one will be just as well filled as the other."

"Is not this foundation rather expensive?"

"Yes. It cost me 75 cents per pound, and that is about ¾ of a cent per section; but if I can get ½ cent more per pound for these extra well-filled sections it will pay me to use it, even at that price. I shall experiment further the coming season with this foundation."

SUPER FOUNDATION FOR THE BROOD-CHAMBER.

The Use of Weed and other Foundation.

BY W. T. STEPHENSON.

I was very much interested in that contribution on page 789, by Wm. M. Whitney. I have been experimenting along the same line myself, viz., using super foundation for the brood-chamber. I did not, however, buy the surplus foundation with the intention of using it for brood foundation. I purchased what I thought to be enough of both kinds — brood and super. Late in the season I suddenly needed foundation for about 100 frames. When I examined my pile of brood foundation I found, to my sorrow, I had only about 8 sheets. In my bewilderment I hit upon the following plan: I would use the super foundation for the brood-frames. I fastened one sheet lengthwise to the top-bar of each frame, precisely as the brood foundation was fastened, after which I put small drops of beeswax along the edge of the groove as a reinforcement. This is not necessary with every frame, as some of the wedges are thicker than others. After the foundation (thin or extra thin) is securely fastened I have no more trouble from sagging or warping than with brood foundation.

I presume I had better say the foundation used was the Weed patent. Success having crowned my efforts last year, I concluded to try it on a larger scale this year. I didn't get the Weed foundation (not fully appreciating its superiority), and consequently my experience this year was quite on the other extreme. After I had stayed this foundation with wedge and beeswax, the weight of the bees would tear the foundation in two. It would warp and fall down after the cells were ¼ inch deep. Such a mess! I was thoroughly sick of my trade. Notwithstanding my "bad luck" this season, I am quite certain that, unless full sheets of foundation are required, the Weed super foundation will do all right.

There is, however, one serious objection to using super foundation for the brood-frames. It is this: Unless there is a brisk honey-flow (brisk enough to keep the bees busy) they have an idle habit of gnawing holes through the midrib of the foundation. This makes pop-holes in the combs, as the bees will never replace the septum they have gnawed away.

I heartily sanction what Mr. Whitney says in regard to farmer bee-keepers using the thin foundation. If the apiarist can't give the bees the attention they need he had

better use something true and tried; viz., brood foundation. W. T. STEPHENSON.
New Columbia, Ill.

[Bee-keepers, if they only know it, can save quite a little expense by using thin foundation for brood-nests; but it must be intelligently used. Let the careful bee-keeper look to his profits.—ED.]

BEE-KEEPING IN NORTH DAKOTA.

BY A. P. ASPINWALL.

Wahpeton is at the confluence of the Otter Tail and Bois-de-Sioux Rivers, the two forming the Red River of the North. The Red River has numerous tributaries whose banks are bordered with forest trees.

There are numerous groves of wild plums and some basswood.

The flora of the valley is wonderful for its profusion and variety.

The nectar from which the honey is produced all comes from wild plants and trees.

There were three kinds of honey made this year—dark, white, and yellow, or amber. The dark came in the fore part of the season, the white in July, and the amber during August and September. There was no finer honey on exhibition at the Pan-

American. The hives are all eight-frame Dovetailed, made by the Root Co. They are painted red, white, and blue. The back end of the hives rests on a piece 2×4, and front on a one-inch board, which projects in front, answering for an alighting-board. Bricks are used for weights, and to indicate the needs of the colony, and supers by their position. Young fruit-trees are planted between the rows.

The timber in the rear of the house is on the Bois-de-Sioux River.

I run entirely for comb honey, which has a good local demand.

The bee industry of the State is in its infancy. It is bound to come to the front as soon as its possibilities as a honey-producing State are known.

Wahpeton, N. Dakota.

HAULING BEES.

How to Do it by Loading them on a Wagon Just as they are in the Yard, Without Closing the Entrances.

BY ADIN STONE.

I have noticed the experience of others in moving bees from place to place, and the trouble from stings to men and horses in the operation. It has often recalled my

APIARY OF A. P. ASPINWALL.

own experience to mind. I will tell you how I moved my bees without closing the entrances.

I had about one mile to move, and about as many hives as I could place on a lumber-wagon as they sat in the apiary. I loaded them in as they sat, first using the smoker to drive the bees inside. I hitched a horse to the load and drove to my destination; unhitching the horse from the wagon, I waited until morning, when I set them on their stands. These were full colonies in eight-frame hives, Hoffman self-spacing frames, loose bottom-boards, $\frac{1}{4}$ -in. entrance full width of both ends of hives. All of them were left open as they stood when at work in the apiary. I moved on a lumber-wagon without springs, over a stony road, and through a small village, in daylight, between 6 and 7 o'clock p. m. I don't advise anybody, nor claim this as the proper way to handle bees; but I tell what I did successfully. Not a person was stung, nor any trouble whatever came from the bees. Of course, they came outside and clustered on the hives. I walked and drove the horse (not a very steady one either).

I found the same principle to work in this case as in handling bees in hives or hiving swarms. When thoroughly alarmed, and filled with honey, the bees attended to their own business and troubled nobody. I am satisfied I could have driven for miles with them.

I can not say that this plan will always work. It did that time and season, between spring and summer. Some new honey was coming in at the time. I am the person who called your attention to Hoffman frames years ago.

ADIN STONE.

North Bay, N. Y., Nov. 24.

[We have already had one report as to how a load of bees was carried over miles of road successfully without closing the entrances; and I believe that the method can be practiced to advantage a great many times, and at the same time save considerable labor. When screens are used there is always danger of the bees smothering; and especially is this true during warm weather. They will sometimes smother, even when the whole top of the hive is covered with wire cloth; and if they do not die outright they are of but little use afterward because of the previous scorching or overheating while *en route*. It is a well-known fact in bee-dom that a colony that has been jarred or bumped a few times becomes very docile, providing, of course, that this bumping is preceded by smoking. Of course, one could not expect to walk up to a hive and give it a kick without experiencing a most vigorous protest on the part of its occupants. But a smoking at the entrance will prepare them for further treatment; but it would not do, I should suppose, to give them just a few "whiffs." The whole colony should be brought under the influence of the smoke. After the load is once on the road, I should fear no further

danger. It is the starting—the first few bumps—that might cause a circus performance on the part of horses and driver.

This is somewhat of an interesting question, and I should be glad to have reports from others as to the feasibility of moving bees without closing the entrances.

I might say, right in this connection, that, in felling a bee-tree once, we had a good example of this. On the first shock—that is, when the tree struck the ground—the bees rushed out in battle array; but as soon as we begin chopping the log right over the supposed cluster of bees they subsided, and very soon we took off our veils. The chopping demoralized them to such an extent that they acted as if they were thoroughly subdued by smoke. Why should not bumping over rough roads have a similar effect?—ED.]

PROF. FRANK BENTON, of the Department of Agriculture, Washington, D. C., and Pres. W. F. Marks, of the New York State Association of Bee-keepers' Societies, are taking a hand in answering some of those comb-honey canards. Good! Keep it up all along the firing-line.

OWING to the great accumulation of good matter on hand that was awaiting insertion, and seasonable too, I found it necessary, in order to find room for it, to leave out my own travels for this issue; and although we give 8 extra pages, in addition to our regular issue, there is still quite a quantity left.

THE bees in our two cellars at this date have just been examined, and, according to Mr. Wardell, they are doing finely. We are not paying much attention to temperature, but are giving large amounts of fresh air. The 250 colonies under the machine-shop, unless the weather is very cold, get a fresh supply from outdoors all night.

ONE editor, who said something in his paper about manufactured comb honey, when shown the truth, came out with a manly retraction. In a private letter to a friend he says: "I wrote hastily, made a mistake, and take pleasure in correcting it." There is no reason why every one of the publishers should not be equally willing to correct the error. They would lose neither prestige nor dignity by so doing.

BEE-KEEPING IN THE WEST INDIES.

THIS is the title of a neat pamphlet of 78 pages, received from and published by Dr. D. Morris, Commissioner of Agricul-

ture for the West Indies, written by W. K. Morrison, well known to readers of GLEANINGS. As its name indicates, this book is prepared especially for the tropics, and a very careful reading fails to show any thing which is subject to adverse criticism. On the other hand, it is worthy of a careful reading by bee-keepers and prospective bee-keepers in that section of the country. It is intended as a guide to beginners, and is full of valuable information. The bee-keepers of the British West Indies are to be congratulated on having so able a man as Dr. Morris, for he has not only made it possible to furnish them this book without expense, but is assisting them in many other ways.

PROSPECTS NOT FLATTERING FOR CALIFORNIA HONEY NEXT SEASON.

SEVERAL of our subscribers in California have written us that, up to the 1st of January, there had been little or no rain, and that this was the smallest amount up to that date for a *period of over thirty years*. Of course, there may be copious showers yet; but they will need to come soon if they are to do any good.

There are quite a number of bee-keepers on the coast who held back their crops last summer rather than sell at low prices, and wisely so, I believe. They will surely find a market next season for all they have, at good figures. A prospective short crop in California ought to mean a stiffening of prices throughout the whole United States; for there is no one State in the Union that, in a good year, gives anywhere near the amount of honey that California does; and when it unloads after one of its big seasons, it is apt to make a flurry in the market.

THOSE COMB-HONEY CANARDS, AGAIN.

A GOOD part of my daily correspondence is answering a great variety of clippings, slandering the comb-honey business, in the various weeklies and dailies throughout the country. The task seems almost hopeless, and I again call on our readers to help. If every one of our subscribers would sit down and write a short note to the paper publishing such stuff, its editor would begin to think bee-keepers were somebody, and that he would lose subscribers if he did not retract. Suppose a publisher got a dozen letters a day, and some days a hundred; and suppose the flow of protests continued for two or three weeks, he would soon see that he would have to do something to square himself with the world, and he would. There is nothing like the force of *numbers* in a fight of this kind.

Brothers and sisters, this means bread and butter to *you*. If you do not wish to see a staggering comb-honey market another year, get right down to business at once. But perhaps you say you do not know what paper to write to, or have forgotten. Let me suggest that you turn your guns on the *Chicago Tribune*—the paper that started

these comb-honey canards and which has never really retracted. Let that paper *feel* that there is a *power* back of bee-keepers. The *Chicago Chronicle* has retracted handsomely, and so have half a dozen others.

There is another paper that persists in the wrong, and that is the *Farmers' Guide* (blind?), published at Huntington, Ind. Besides these two, there are scores of other sheets that I will not mention particularly, as I am not in position to know whether or not they have made any correction or propose to.

Our attorney is at work on the case where the members of the Root Co. are accused of putting out manufactured comb honey. The law is slow, but we have every reason to believe that our accuser will have to "eat crow" or go to jail, for we have been accused of a crime.

THOSE BEES IN THE MACHINE-SHOP CELLAR; IMPORTANCE OF FRESH AIR IN BEE-CELLARS.

THERE are 200 colonies of them, and they are wintering finely. To all appearances they are doing as well as the 50 colonies did a year ago; and these, it will be remembered, came through without the loss of a colony, and scarcely any dead bees on the floor. During warm nights, when the air is sultry we open the door opening into the outer cellar, and just opposite this door is a window leading to the outside. The cool fresh air pours in all night, and then before daylight comes on the door is closed. We have tried keeping the door shut every night running for three or four days, but the bees get uneasy and begin to roar. This goes to show that an infusion of fresh air from outdoors and a constant supply of it *all the time*, day and night, from the outer cellar having ten times the cubic capacity of the room in which the bees are, is important. Yes, indeed, I am becoming more and more convinced that plenty of fresh air in indoor wintering is one of the prime essentials, and that variation in temperature is only secondary. Why, the mercury in our bee-room last year, where the bees wintered so perfectly, moved up and down all the way from 38 to 60, and noise—there was a constant banging and slamming, and yet you will remember I kept those bees in till about the middle of May. The dead ones had never been swept up, and yet you *could almost* walk across that cellar without stepping on one. When we remember that it is considered good wintering indoors, even if the cellar is completely covered with dead bees, the results I have mentioned are all the more remarkable.

The bees in the out-yard cellar are not doing quite so well, for the reason that a street-railway company have two or three times filled our drain, causing the water to back up. But we are sure of this, that Bingham's idea of ventilation through a shaft 20 inches square, going from the roof of the cellar on through the roof of the building above, is all right.

I believe bee-keepers have been making a great mistake in their house bee-cellars by not giving the bees fresh air, and lots of it.

N. B.—I forgot to say that rats have been getting among our bees. We arranged with a man who owns a ferret to come and clean all the rats from our premises. He has done this to our complete satisfaction, and he says it will be some time before they get back to trouble us. For particulars see page 81. Cats—well, many of them, to use plain English, are nasty around factory buildings, and only a few of them will tackle rats at best.

GLASS FOR SHIPPING-CASES—A BRIGHT IDEA.

It is well known by all bee-keepers that glass, during the last year or so, has taken several sharp advances. Although it has slumped a little within the last few days, the reduction in price is so slight that the problem of glass is still something serious to be considered. But, happily, our friend F. A. Salisbury, of Syracuse, N. Y., has struck upon a bright idea. He learns that there are quantities of glass from old negatives rejected by the people for whom they were taken, that can be had of many of the photographers for the mere asking, providing, of course, the artist has the assurance that no print will be taken from such negatives. The standard size used by the average photographer, and from which cabinets are made, is 5×7. Mr. Salisbury conceived the idea of gathering up a quantity of these, quartering them with a glass-cutter so that he would have four lights 2½ × 3½, or enough glass for one whole shipping-case with four rows of sections. This is the way he got at it:

He took some strips of section wood and cut the same in lengths equal to the width of the glass, and of the same thickness, and wide enough to make the proper spacing. Now, then, he slides a glass into the groove, and then a piece of the wood, or "button," as he calls it; then a glass and another button; still another glass and another button. In this way he gets in four little lights. The space between the lights is closed up by the wood, which, coming directly in front of the upright edges of the sections, helps to set off the honey to advantage—the little strips of wood, or buttons, covering up the often propolized section and the unsealed cells next to the wood. The result is at once neat and pleasing in its effect.

Mr. Salisbury finds that the trade, as well as bee-keepers generally, pronounce the four-light negative-glassed honey-case as neater in appearance than the old-style case with *one long glass* showing all the defects of the boxes of honey. Of course, when the glass is only 2½ inches wide the top and bottom grooved strips for the glass must be wide enough to take in the width. There are some who would feel that this 2½ width is too narrow; but as negative glass can be obtained so cheaply one can afford to cut it with some waste. The 3×4 size would make only a small waste; that is to

say, one can cut two glass lights out of one negative. But there may be places in the rural districts where negative glass can not be obtained. Then go around to your hardware stores and gather up all the scrap glass they will let you have. In some places they will be glad to have you take it away for it; in others you can get it for a small price. This, of course, would be in all sorts of shapes. But with a little practice one can, with a glass-cutter, convert it into squares rapidly and easily.

Mr. Salisbury says he can quarter 5×7 negative glass at the rate of 12 lights per minute, or 600 for one hour, or what I should suppose about 5000 per day. His 5×7 glass cost him 7½ cts. per 100. Cutting and washing at 20 cts. an hour would cost 6½ cents, or a total of only 14 cents for 100 lights, 56 cents per 400, or which would be equivalent to only 56 cents for 100 shipping-cases. The regular glass for 24-lb. single-tier cases, four rows, for 100 cases, is listed in the supply catalogs at \$2.50, or *nearly five times as much*. But suppose there are rainy days or bad weather when one's time is not worth 20 cents an hour. Then the 56 cents will be cut down still lower, or, in other words, what one saves he actually earns.

Those who have honey now to crate should try the experiment of negative glass, and thus work against the glass trust.

Oh, yes! I forgot to mention that glass for negatives is necessarily perfectly clear and white, without spot or bubble, or the photo-supply manufacturers would not use it.

HOW TO CLEAN NEGATIVE GLASS.

Mr. Salisbury explains that the trick is very simple. Into a kettle of boiling water he pours a quantity of potash; then throws in all the glass that can be submerged; allows it to soak a little, pulls it out and rinses it. The removal of the photographic film is very easy.

The cut shows first a shipping-case with one long glass; next, one with old 5×7 negatives quartered; and, last, 3×4 glass from the scrap obtained at a hardware store. The picture hardly does justice to the new idea.

CAN OUR BEES BE IMPROVED? SOME PLAIN
PRACTICAL SUGGESTIONS ON HOW IT
CAN BE DONE.

"Good evening, Mr. Doolittle. Awfully cold outside to-night."

"Yes, very cold; but not so cold as it was this morning, is it, Mr. Brown?"

"Well, perhaps not; but I see it was down to zero a little after sundown, and that is what I call awfully cold for the 7th day of December. What was it here this morning?"

"It was 6 degrees below zero here; 9 below at the Willow Dale Mills, and, I am informed, it was 22° below at Homer."

"Whew! that is the coldest I ever knew it thus early in the winter. And they tell me that Otisco Lake is frozen over the entire length of it, the ice being two inches thick—something never known to the oldest inhabitant. Have you got those bees in the cellar yet, over at the out-apiary?"

"No, and I am feeling quite concerned about them. To be sure, they are all in good condition for cellar wintering, but in just no condition at all for outdoor wintering; but as most of them have snow all about them, nearly up to the top of the hives, this will help some during this severe weather. No one thought that, with the night of Nov. 10, when our weather had been so nice for four weeks, winter could drop on us with the morning of the 11th. But so it was; and as the hives were all covered with snow, which was frozen on, I thought it best to leave them till it warmed up enough so the snow would fall off, and am still waiting. The fact is, it is a hard matter to tell just when is the right time to put the bees in the cellar, and it is as often perplexing to tell when to take them out."

"Yes, that is so; and I hope yours will not suffer materially from being out till a warm spell comes, which I expect before the middle of the month. But I came over to have a little talk about improving my bees. Do you think I can make any headway in the matter if I try? Neighbor Smith says he has tried for ten years with his, but he does not see that they are any better now than when he commenced."

"I fear Smith has not put the effort into this matter that he did when he made such an improvement with his cattle. He could easily see that a part of his cows were not nearly as good milkers as were others, and so he went to work to have all as good as the best, and he told me that he succeeded too. Can you see any difference in the gathering qualities of your bees?"

"Yes. Some colonies gather from one-third to double as much as others."

"And such is the case with very many bee-keepers, especially those who have ta-

ken no really advanced ground in trying to improve their stock. Probably there is not an apiary in the United States, containing twenty colonies or more, but that the owner thereof is compelled to acknowledge that certain colonies do better than others nearly every year in producing honey, unless said owner has taken pains to bring his stock up to a high point of excellence along this honey-gathering line. Were it otherwise, we should not so often hear it remarked, 'If the whole apiary could have done as well as such a colony, I should have had a big yield.'"

"But don't you think that the hive used, and the strength of the colony, have nearly all to do with this matter? Smith says that such is the case."

"I am inclined to think that the race of bees has the greater influence over these things, and that certain traits of character exist in certain colonies of bees that do not in others. If this is so, there is a chance of improvement in our bees, and I am inclined to think it will be to our credit in the future to work more for the improvement of our bees, even though we 'slack not our pace' on the improvement of hives."

"But how can we accomplish this improvement?"

"I know of only one way at present for the rank and file of bee-keepers to accomplish this, and that is through the queen. If we could control the drone, as we can the male in our other animals, the matter would be much easier; but as we can not control the drones to any great extent, we have only the queen to aid us materially in the improvement, as a certainty."

"Well, such being the case how shall we proceed?"

"I do not know that I can give you my views better than to relate some of my experience. A score or more years ago I began to turn my attention to this matter, and soon adopted the following plan: At the close of each honey season I struck an average of the number of pounds of surplus honey produced by the whole apiary; and then all colonies which did not come up to this average were marked. These colonies were united, either in the fall or spring, with others, which had produced an average amount, or above, if such uniting was deemed advisable, through colonies light in bees or scarcity of honey. If all were not disposed of in this way (of course I always destroyed the poorest queen and retained the other), I superseded the inferior queens by those reared from colonies known to have produced the very largest amount."

"But such a course would require the keeping of a record of each and all colonies in the apiary."

"Yes, and the keeping of such a record would be of much benefit in several ways besides the one I have spoken of."

"This keeping a record is something I have often thought about, and spoke to Mr. Smith about it only the other day. He said

he kept no record, and did not think it would pay so to do."

"Did you ask him if he kept any record of his cows when he was trying to improve them? It turns out as I expected. If Mr. Smith had been as anxious for the improvement of his bees as he was for the improvement of his cows he *would* have kept a record, and would have known that such a record paid with the bees as well as with the cows. Very little improvement can be made with the bees unless a record is faithfully kept of each colony."

"And it would not be a very serious job, would it, to keep a record of the number of pounds of honey each colony produced?"

"It is not with me. I have a piece of section tacked to each hive, and on this section I jot down the number of pounds of honey taken each time from the colony living within, and at the end of the season an adding of the amounts gives the yield from that colony. Some use a book, having a page for each colony, the hives being numbered, and a page given to each number. This may have the advantage that you can 'post up' the book evenings or on a rainy day. But the section plan is very good, as I know from experience."

"Do you keep any thing besides the honey-yield on this record?"

"Yes. Prolificness, length of life of the workers, whiteness of cappings, wintering qualities, etc., are all looked after, and all queens at all times are reared, as far as possible, from those giving the highest number of points along all these lines, and in this way any apiary can be kept steadily improving instead of holding its own or retrograding."

THE POTENCY OF THE MALE IN BREEDING: SOME THINGS WE DON'T KNOW.

Mr. Root:—In touch with an article on p. 778, where you ask how Dr. C. C. Miller knows that the father of the drone's sister does not exert some potent influence on the drone himself, and to which Dr. M. quotes from Dzierzon, in *Stray Straws* for Oct. 15, also some of his own knowledge of the other facts in the human race, I quote only from my own experience as a breeder of fancy fowls and cattle. I once bred a Jersey of a St. Lambert strain, and of registered stock, to a Holstein bull, and had a black-and-white calf, as I expected; and the same cow, bred to a full-blood Jersey the following year, brought a black-and-white calf, the very image of the Holstein sire used before. This trait shows up more in the breeding of dogs than in any other animal. I once owned a fine female pointer, crossed her with a spaniel, and for three litters af-

terward her young showed traces of spaniel blood. Why not the same in bees? One will often go into the poultry business with the idea of raising fancy fowls; but it is no small job to have your stock purely mated. I once paid a good sum for a setting of Brown Leghorns, and got a nice lot of mongrels. My watchword is, "Breed from the best in the stock," as well as in the poultry business; and if all is well in 1902, that is going to be my watchword in queen-rearing.

W. E. HEAD.

Paris Station, N. Y., Oct. 21.

[It is a well-established fact that the influence of the male may extend to offspring not sired by him, even for some time to come. It is reasonable to suppose, then, that a drone may be blood-related to his nominal sister. If this be the case an Italian queen that has met a hybrid drone might, and probably would, produce drones (as well as bees) having some of the characteristics of the sire; but if the Dzierzon theory is correct in every particular, then the drone in the case cited would be just as pure as his mother. There are some things here that are not proven yet.—Ed.]

DOOLITTLE'S FOUR COLONIES; A QUESTION ASKED.

Should not G. M. Doolittle, in that communication of his, "The Season of 1901," page 976, when giving his account of the comparative test of those four lots of bees as to the lengths of their tongues, and honey product, have furnished us an explicit statement of the quantity of bees and brood in each hive at the start? He has left us to assume they all started even, but he does not say so. The omission is a serious one. It renders the account given valueless. As to how it happened that he made the omission it would be idle now to inquire. A slight disparity at the start might make a greatly disproportionate difference in the results. The comparison made is not between the total amounts gathered by the several colonies, but between the amounts of their several surpluses over and above the quantity needed for support of each colony—quite a different thing.

How much honey will a colony consume when working twelve hours in the day, nursing, comb-building, ventilating, and on the wing?

W. C. EASTWOOD.

Whitby, Ont., Dec. 22.

[Mr. Doolittle says the four "were worked as nearly alike as possible." He might mean by this that they were nearly alike in brood and bees; but the statement, as you say, is not explicit. Of course it would make a great difference if there was a variation in the quantity of brood and bees.

As to how much we must allow for consumption, evaporation, etc., depends upon the strength of the flow. The loss will be from 25 to 50 per cent of the amount gathered during the day. See article by A. B. Cox in this issue.—Ed.]

CONFUSION OF BEES JUST CARRIED OUT OF THE CELLAR.

Are you troubled in the spring about the bees flying out of the hive when you are taking them out of the cellar? When do you take them—in the morning or in the evening? I have always taken my bees out in the morning, and have been bothered some about their flying out when I am taking them out.

WM. CRAIG.

Luce, Mich., Dec. 9.

[Bees will fly out pretty freely when put out of the cellar for the first time in the spring, especially if the day is warm, as it should be for setting out. A good deal of confusion results sometimes by the bees going into the wrong hive; but this hardly makes any serious trouble. It is sometimes advisable, if the weather-report indicates warm weather the next day, to set the bees out the night before at dusk, as they will then be able to calm down; but even the next morning they will fly out and get mixed up some.—ED.]

ROARING IN THE CELLAR.

I take the privilege of asking for information in regard to my bees. I have had my bees in the cellar under the house for the last month, but they do not seem to settle down. They are in a roar all the time, and some of them leave the hive and come up in the house. Not more than half a dozen have done this. The temperature runs from 40 to 50.

F. R. PALMER.

Carlton, Minn., Dec. 10.

[Roaring in the cellar is generally caused from want of ventilation. We would advise you to open the cellar at night, after it gets dark, and close it in the morning before daylight, providing in so doing you do not reduce the temperature too much. It ought not to go below 40 degrees nor above 60. The roaring may also be caused by too high a temperature. This stimulates an activity of the bees, causing them to consume a larger proportion of oxygen, giving off carbonic-acid gas, and vitiating the air. The remedy, as before explained, is ventilation.—ED.]

VENTILATION OF BEE-CELLARS; WIDE VS. LONG SECTIONS; SIDE-OPENING FENCES.

We have just completed a repository for 200 colonies. It is 20x20, 7 feet high. It is not a cellar, but an upper-ground affair. It is packed with 8 inches of clover chaff on sides, and 14 inches on top. It took 16 loads of chaff (a sixty-bushel wagon-box constituted a load). For ventilation a ventilator-box will be placed at the bottom, and a shaft at the top. A damper will be placed on box and shaft, which will be operated by an automatic regulator. When the temperature rises above 45, both dampers open, the cool air entering at the bottom, and crowding the warm and impure air out at the top. When the temperature

drops back to or below 45, the dampers close—no need of a person opening and closing the dampers. The regulator is supposed to do that.

What objection is there to a section one-third longer than the regular $4\frac{1}{4}$, or a section three of which will occupy the same space lengthwise in a super that four of the ordinary $4\frac{1}{4}$ do?

We have just been looking over your list to try to decide on a separator. We note what you say in regard to the fence giving freer communication than the ordinary sawed or veneer separator. When you first put the fence out we said that was one of the best moves you ever made in the surplus apartment. Now, if free communication of the bees sidewise is good, would it not likewise be a further improvement if the bees could have free communication endwise or all around?

H. C. QUIRIN.

Parkertown, O., Dec. 9.

[Your cellar 20x20, 7 feet high, ought to give fairly good results provided you put in not more than 200 colonies; but there should be a ventilator running up through the roof, at least 18 inches square, and so arranged that it could be closed during very cold weather. See Bingham's article on this subject in December 1st GLEANINGS, page 933. Our cellar, 12x20, $6\frac{1}{2}$ feet high, has only a six-inch ventilator, and we find it is not nearly large enough, and shall be compelled to enlarge it as the bees get uneasy.

One objection to sections one-third longer is that they would be odd-sized; and, again, the proportion would be wrong. If it is better larger, it should be tall rather than long or wide.

It would be an advantage to have free communication sidewise as well as through the separators or fences. Mr. Aspinwall, of Michigan, and H. H. Hyde and Louis Scholl, of Texas, have devised separators giving lateral communication. While there seems to be an advantage in having the sides open, it weakens the separators or fences to such an extent that they will not stand ordinary usage.]

QUEENS WHOSE BEES ARE ALL STRAIGHT FIVE-BANDERS.

I have this night had opportunity to look over Dec. 1st GLEANINGS, and it is with great surprise that I notice your statement on page 937, that you have never seen a queen that would produce all straight five-banded workers, and that the best average for one queen, perhaps, was 50 per cent, and as a rule 25 per cent of five-banded workers was all that could be expected.

I am very much surprised at that statement. If you have never seen a queen that would produce straight five-banded workers, will you please come to Floresville on the first opportunity presented? We not only have one queen, but we have several straight ones, and one in particular, whose bees are not only all five-banded, but some

of them, when filled with honey, show a glimmering of the sixth. What I mean by five bands is five broad distinct yellow bands, thus making the bees yellow almost to the tips. We are not the only ones having straight five-banded queens. There are two or three others who have them, and from whom we got our first stock. We have found these goldens to be good workers, and a very good bee for climates that have a short season, or where there is only one short honey-flow. For localities like our present one, where we have long seasons and several honey-flows, we find that they are not as good as the three-banders, or what we really prefer—the Holy Lands or Cyprians.

H. H. HYDE.

Floresville, Texas, Dec. 20.

[The facts are as I have stated them. If you have queens that produce workers *all* with five distinct yellow bands, then I stand corrected.—ED.]

UNFINISHED SECTIONS; EXTRACTING, AND HOW.

I see by GLEANINGS that some besides myself have been puzzled to know what is best to do with unfinished sections. Although in some localities little trouble is experienced, yet in places where the whitest honey is stored in the fore part of the season, and dark honey in the latter part, it is not practical to put dark sealed honey in the supers when the bees are storing white honey, making a "patchy-looking" comb. It is the custom of some bee-keepers to feed the unfinished sections to weak colonies in the spring. This, I have found, has its disadvantages. The sections become soiled, and are not suitable for storing the best grades of white honey in, when we need the unfinished sections most to get the bees started to work in the supers; and we can not depend on the bees uncapping all of the cells unless they are badly in need of honey. By uncapping it this difficulty is largely overcome.

MACK'S EXTRACTING-FRAMES FOR UNFINISHED SECTIONS.

A better way to dispose of the honey in unfinished sections is to make two frames as thick as the section is wide, and wide enough to take in two sections, and leave $\frac{1}{8}$ inch to spare, and long enough to take in four sections and leave $\frac{3}{4}$ inch to spare. Fill the frames with sections, and put them in the extractor. Turn the extractor at half speed; reverse the frames, and give it

full speed. Reverse again at full speed, and you will have 16 sections in good condition for the bees to store white honey in, early in the spring, when it is hard to get bees to make comb, when it is cool, and there are comparatively few bees in the hive; and if the cut with the uncapping-knife is deep, there will be no show of yellow cappings from the old combs. The work should be done while it is warm, and as soon as the honey-flow is over. If left until spring they will candy, and it doesn't extract the candy.

Probably the majority of bee-keepers who produce comb honey do not have extractors; but where one produces much comb honey an extractor is almost indispensable.

J. M. MACK.

Nellie, Cal.

[Many bee-keepers use the old-fashioned eight-section wide frame for holding sections while in the extractor. With the exception that it has projections to hang in the hive rabbet it is essentially the same thing as what you describe. It is true that the only practical way to extract unfinished sections is the one you use.—ED.]

REPORT OF THE ONTARIO INSPECTOR OF APIARIES; THE FOLLY OF BUYING AND SELLING OLD COMBS.

During 1901 I visited bee-yards in the counties of Bruce, Grey, Perth, Oxford, Waterloo, Wellington, Wentworth, Halton, Peel, York, Ontario, and Simcoe. I inspected 77 apiaries, and found foul brood in 29 of them, and dead brood of other kinds in many others.

Some bee-keepers secured the combs from others who had lost many colonies of bees, and, not knowing that these combs were diseased, brought them home and put them into use and spread the disease in their own apiaries.

When foul-brood matter dries down it glues itself fast to the lower side and bottom of the cells, and there it will remain just as long as the comb lasts, and in old dark combs the stain-mark left in the cells from the disease is not noticed by those who never had any experience with foul brood. It is when the disease becomes widely spread that bee-keepers wake up to the fact that their colonies have foul brood.

These mistakes which have so often ended in big losses from bringing diseased combs into apiaries should be a warning to bee-keepers not to deal much in old combs. No bee-keeper would bring a diseased comb into his apiary if he knew it contained foul brood; and the men who dispose of such combs do not know that they are diseased when they deal them off.

I received many letters from bee-keepers, asking me to visit their localities, and, while inspecting there, to stop with them. I was much pleased with the generous treatment I received from every person, and, in turn, I felt that I was in duty bound to help the people all I could in every possible

way besides getting their apiaries cured of foul brood, and I did so.

I am also pleased to say that nearly all of the largest and best-paying apiaries in Ontario are among the very many that I got perfectly cured of the disease years ago.

WM. MCEVOY.

Woodburn, Ont., Dec. 3, 1901.

TWO COLONIES IN ONE HIVE.

1. Do you think I can put two colonies of bees into one hive by placing perforated zinc between them, or do you think that the bees of one queen will kill the queen of the other bees? Have you ever united them in that way?

2. Do you think it would be best to put wire cloth between the two colonies?

3. Please inform me how to sweeten comb honey that has soured. I had some unsealed comb honey that soured. This is the first year that I have had that experience with comb honey.

L. H. LINDEMUTH.

Lehmaster, Pa., Oct. 7.

[1. I do not think it would be practicable or advisable.

2. You can use wire cloth successfully; in fact, we sometimes use three or even four nuclei all in one hive, separated from each other by wire cloth, each having a laying queen.

3. I do not know of any remedy, although *extracted* honey can be improved by boiling it.—ED.]

WHY THE BEES BALLED THE QUEEN.

I was examining a hive of bees with ordinary precaution, when I discovered that the bees had balled the queen and were stinging her to death. I removed the queen for a few hours, and upon returning her I found she received the same treatment as before. This queen was brought up with the hive of bees, and I do not understand why this case should occur. As I have never heard of or experienced the same before, I have taken the liberty to write you in regard to the matter.

BION B. WHITNEY.

Standish, Maine, Oct. 22.

[It sometimes happens that bees will ball their own queen. I have sometimes thought that the opening of the hive, or some peculiar disturbance, irritates them to such an extent that they lay the cause of their disturbance on the poor queen, and thereupon proceed to wreak vengeance. Again, a virgin queen from some other hive may get in, and this is the queen that is balled. Sometimes the newcomer is accepted, and the old mother that has been doing duty faithfully for two years is ruthlessly balled, and stung to death. The regular accepted mothers that have been found balled have been left to their fate by the apiarist. Examination days afterward showed that she was all right, and doing her regular accustomed duty. This would seem to indicate that

they had somehow "settled their differences."—ED.]

CARBOLINEUM PAINT, AND WHERE TO GET IT.

Tell Dr. Miller he can get carbolineum avenarius close at home, in Milwaukee, at about 65 cents a gallon, or cheaper still in large lots. It can be mixed with red mineral paint or the dry colors, rather; but if mixed with white lead it will look as a coat of varnish would over outside white.

Bard, Ark.

H. ZEINER.

BEE-KEEPING IN SPOKANE.

Friend Root:—Herewith I would answer friend J. O. Haynes as to the possibilities for bees and honey at or near Spokane, Wash. I went from here to Washington 7 years ago with 110 colonies of bees. I intended to locate at or near Spokane; but I could find no place where a bee could make a living, to say nothing about laying up any surplus all through the latter part of the season, as they can not irrigate, nor have they enough rain there to make flowers grow. The Yakima Valley is a better country for bees, but that is already occupied, and that country is full of alkali water, and is very hot in summer. But if our friend wants to come back here, I will sell him my little fruit and bee farm with plenty of soft water, and a healthy and cool climate—just the thing for friend Haynes.

J. P. BERG.

Traverse City, Mich., Nov. 25.

MORE PARTICULARS CONCERNING THE EUROPEAN BASSWOOD.

There are several distinct varieties—*Tilia parvifolia*, Ehrh., the small-leaf lind, also called the late lind. This is the plant for the bees. The tree attains an age of more than 1000 years, and a height of 60 to 70 feet. Near Neustadt, in Germany, is a lind which has a circumference of 32 feet, and was well known already in the year 1292. On account of their dense foliage and fast growth they are extensively planted on streets and roads. The wood is fine and soft, but strong; insects do not seem to like it, therefore it is much used in fine arts for carving, etc. The inner bark furnishes good bast for ropes and mats. It is a hardy tree, blooming in Germany in July till August. I think it would do well all over the United States. The flowers stand in clusters of five to seven, and therefore are easily distinguished from *Tilia grandifolia*, which bears clusters of two to three flowers. The leaves of *Tilia parvifolia* are naked on both sides, and on the under side gray-green. The flowers are much used for making a good tea for catarrh. When in bloom they are always covered with bees.

Tilia grandifolia, Ehrh., the large-leaf lind, is at home principally in Hungary. Its leaves are on both sides green, but on the under side have short fuzz; bloom in June to July, and are considered to be two

to three weeks earlier than the first-mentioned variety. It is used as an ornamental tree.

Tilia platyphyllos is another variety, sometimes used for ornamental purposes.

All varieties have one common flower-stem attached to the middle of a long leaf, similar to our American variety.

I will try to get some seed of *Tilia parvifolia*, which alone should be planted as the best of the above varieties.

Visalia, Cal., Nov. 24. O. LUHDORFF.

ALFALFA FOR HONEY—A CAUTION.

Last August I wrote, giving some suggestions about sowing alfalfa, and I also spoke of getting honey from it. Since then I have had several letters of inquiry about alfalfa, the amount of honey it yields, the price of land here, etc. Although alfalfa is one of the greatest if not *the* very greatest honey-plant known, do not build too high hopes on it or migrate all of a sudden to an alfalfa region, simply for the reason that, in future, very little honey will be obtained from it, owing to the fact that, unless it is left for a seed crop, it will be cut just as it commences to bloom. In my own alfalfa I notice the bees do not commence to work much on the flowers until the latter have been in bloom some time. According to tests made by our Kansas Agricultural College, the feeding value of the hay is much greater if cut when only a tenth of the plants are in bloom, and nearly all will be cut in this locality at about this time in future, and only those who raise it for seed can be depended on, and that would not be many. Land here is very high. Good valley land is worth \$60 an acre, and some still higher, up to \$100, according to locality.

M. F. TATMAN.

Rossville, Kan., Dec. 25.

[I have already referred to the tendency on the part of alfalfa-growers to cut their alfalfa before it is fairly in bloom. If this practice becomes prevalent (and there is grave possibility of it), localities that yield large quantities of honey from it will prove to be very poor if not utter failures.—ED.]

SCALE RECORD OF A COLONY.

I wish to make a report now of one stand of my bees. In my last report they were in a starving condition. I was feeding. About July 10th I noticed they were gathering honey, and I stopped feeding. On the 20th I placed one hive, a two-story Graham, on the scales, and balanced them by adding weight at 100 lbs. My 50-lb. weight being lost, I had to make it up to 100 lbs. Since then I have secured another 50-lb. weight, and am weighing at actual weight now.

July 20, 8 a. m., 100 lbs.

July 20, 7 p. m., 102½ lbs.

July 21, 5:44 a. m., 102¼ lbs.

I lost ¼ lb. by evaporation during the night, the dry weather being intense, not much water.

July 21, 7:42 a. m., 102 lbs.

There were 4 oz. of bees flying out; colony not extra strong.

July 21, 7:30 p. m., 106 lbs.

July 22, 5:10 a. m., 105¼ lbs.

July 22, noon, 106¾ lbs.

July 22, 4:23 p. m., 107 lbs.

July 22, 7:20 p. m., 108 lbs.

July 23, 5:25 a. m., 107¾ lbs.

July 23, 7:00 a. m., 107 lbs.

I extracted here 21 lbs.; removed extra weight.

July 24, 1:45 p. m., 70 lbs.

July 24, 6:00 p. m., 70¼ lbs.

July 25, 7:30 a. m., 70 lbs.

July 25, noon, 71½ lbs.

July 25, 8:35 p. m., 74 lbs.

July 26, 8:54 a. m., 72 lbs.

July 26, 7:38 p. m., 75 lbs.

July 27, 6:20 a. m., 73½ lbs.

July 27, 1:30 p. m., 76 lbs.

July 27, 7:20 p. m., 79 lbs.

July 28, 7:40 a. m., 78 lbs.

July 28, noon, 80½ lbs.

July 28, 7:30 p. m., 83½ lbs.

July 29, 5:56 a. m., 82½ lbs.

July 29, noon, 84½ lbs.

July 29, 7:15 p. m., 88½ lbs.

July 30, 6:00 a. m., 87 lbs.

July 30, 1:30 p. m., 89½ lbs.

July 31, 6:00 a. m., 91 lbs. Rain.

July 31, 6:30 p. m., 91 lbs.

Aug. 1, 5:30 a. m., 90 lbs.

Aug. 1, noon, 91½ lbs.

Aug. 1, 7 p. m., 94 lbs.

Aug. 2, 5:30 a. m., 93 lbs.

Aug. 2, noon, 96 lbs.

Aug. 2, 7:30 p. m., 97 lbs.

Aug. 3, 6:00 a. m., 96 lbs.

Aug. 3, 7:00 p. m., 96½ lbs.

Now, in the above you will see they lost from ¼ lb. at night to 2 lbs. Rain interfered a little, and extracting stopped them a little. Aug. 2d I put on four sections between upper and lower stories; and I suppose they consumed some in wax-working, as they lost weight. I will continue the experiment, and report further.

Ladonia, Texas. A. B. Cox, M. D.

[These figures are quite interesting. Although there are no phenomenal yields per day, the consumption of stores at night is suggestive. It shows how much may be thrown out by evaporation, even on small yields per day, for I assume that the principal loss is the evaporation.—ED.]

ANOTHER PROTEST AGAINST THE SAWED-OFF HOFFMAN FRAME; THE V EDGE DEFENDED.

I can indorse all that is said by Mr. H. H. Hyde, Nov. 1, in regard to the sawed-off staple-spaced Hoffman frame. Hives warp too badly here for that kind of arrangement. I have a strip ¼ inch thick in most of my old hives, to keep the frames from dropping down below the rabbet, and they have full-length top-bars too; and, besides that, I want the ends of the top-bar to lift

the frames by. I have taken particular notice that I *always* hold the frame by these projecting parts of the top-bars. The rest of the top-bar is generally covered more or less with bees.

In regard to their popularity in this locality, I can say that they are not in it at all. I have yet to find the first bee-keeper who likes them. The V edge on the end-bars is all right. I used some square edges, as suggested by Mr. Hyde, and found that propolis would accumulate on them and cause the spacing to get wider and wider each season until I could not get the follower-boards in. By using a little pressure the V will cut through the propolis when warm, so that the same spacing is maintained. I have used frames with top-bars $\frac{3}{8}$ thick and $1\frac{1}{8}$ wide, with inverted comb-guide, for four years, and like them better than any other style. They do not sag, and are more profitable to me than thick top-bars. W. C. GATHRIGHT.

Las Cruces, N. M.

[As I have before stated, we and all the manufacturers are prepared to make top-bars of any length desired. In fact, we keep the long and the short top-bar on hand as standard stock. Let us have a free expression of opinion. Don't hold back your own individual feelings and experiences because you do not happen to agree with the editor.—ED.]

THE SCENT OF BEES DURING SWARMING.

I observe in GLEANINGS for Aug. 1, 1901, p. 639, a most interesting subject by F. W. L. Sladen, on the scent-organ of the bee. Isn't it strange, without knowing anything of the organ, that I discovered about the scent by accident? I had five swarms issue at intervals in one day, and the first three clustered on the *same* limb each time. This set me to thinking. I experimented on certain lines for a time, and now I can say positively that I have found a way of stopping about 90 per cent of the swarms issuing in an apiary. As soon as I am sure a colony is swarming I grab up three or four bees at the entrance of that hive, and, crushing them, rub them on a strip of black cloth. Hoisting this among the circling bees they soon settle on the cloth. To save stinging, grab up with cloth. I never knew any thing of the Zoubareff organ, but I can easily understand why the crushed bees and black cloth have a talismanic effect. LESLIE ALEXANDER.

Malvern, Jamaica, B. W. I.

[It is well known that, where a swarm has once clustered, there is a great probability that another one will lodge in the same place. There is no other cause for this than the scent left by the previous swarm under the full heat of the swarming impulse. Mashing a few bees on a cloth or some other object might have the effect of drawing the swarm. But better—far better—would it be to draw the cloth or branch, or whatever is used for clustering, right

through the bees after they have clustered, raking it back and forth slowly until the object itself has become thoroughly scented.—ED.]

THE DOUBLE COVER NOT SATISFACTORY. AND WHY.

I notice considerable is being said in GLEANINGS recently in reference to hive-covers, and I am somewhat surprised to learn that so many of your correspondents are in favor of the double cover, as in this locality I find them to be a nuisance, especially by affording a good nesting-place for ants and other insects, making them very disagreeable to handle. I'd rather handle the little black bees than ants. I have ten or twelve hives with double covers in my apiary, that I bought about 15 years ago, and every spring I find them full of ants, while my single covers are never, or at least scarcely ever, troubled by them. Many old apiarists may say ants do not amount to much any way—that they do no harm in the hive, and, if they do, it is an easy matter to get rid of them. These fellows may be right; yet I find it very disagreeable, when taking off covers, to have thousands of these little black ants swarming all over me, and biting like little bulldogs, as they often do when I move a double cover, obliging me to change my clothes and drown them out of the covers before I can continue my work.

Swanton, Neb.

L. O. WESTCOTT.

[It is certainly true that ants are much worse in many parts of the West and South than here in the East; but, even if this be true, the two-thickness cover should give satisfaction if it be properly made. We make one style of double cover that we will guarantee to be ant and vermin proof, because it is provided with side cleats to close up the side openings. I quite agree with our correspondent in saying that the *ordinary* air-spaced cover would, for his locality, be very unsatisfactory.—ED.]

A HANDY APIARY TOOL.

Mr. Root:—I wish to add a handy tool for the apiary, to those illustrated in the August 1st number of GLEANINGS. It is a vineyard pruning-knife, with an edge put on the front end and the temper partly drawn so it won't snap off in prying. To separate supers, place the point of the knife at the joint; tap the back with the palm of the hand, to force it in; then either pry down or lift up, and the slightest effort will separate any hive. To separate frames, insert the edge between the frames and then turn the handle sidewise, and apart they come, no matter how badly glued. To get out frames that are stuck, insert the end under the top-bar, pry backward and up, and the frame must come or break. To take off a cover, insert the end under the front strip, and then lift, and the least effort brings the cover up. The back will drive a nail, the front edge will scrape off

propolis, or act as a screwdriver; it will also clean off the frames, split a board, or any other hatchet work, while the leverage is so strong that an ordinary nailed hive can be pried apart with it. It is a veritable little crowbar. I would not keep bees without it. This is a home-made knife, the blade being forged from an old file, and tempered so that it will not break in prying.

I notice Rambler has trouble in getting his wax out of the cans. If he will set his can and wax in boiling water for a minute the wax will then slip out; or, if the can is too big for that, lay the can on the stove and turn it round and round till the wax is melted on all sides, and then chuck it, when the wax will slip out.

Murphys, Cal. E. H. SCHAEFFLE.

A SELF-SEALING TWINE FOR HIVES IN THE SPRING.

Get some fuzzy cord and soak the same with some pasty compound, and sell the same for hive-sealing, and you will find a sale, I think. The cord must have a soft texture, and the compound must seal air-tight, but must not stick like glue. I would send a sample, but have not the necessary compound. Bees need air-tight quarters in early spring, and when they have to gather propolis it gets them into bad habits and loses time.

A. D. WARNER.
Warsaw, Va., Oct. 11.

A SUGGESTION FOR WHEELBARROWS FOR APIARY USE.

In reading in GLEANINGS about wide tires on wheelbarrows, it occurred to me to make a wheel with a three-inch tire, and, instead of a heavy wood rim to fill it, why not make a steel shell, of the proper shape and width to fill the tire, and prevent the sand loading in? A shell could be made something like the rims that were used on bicycle-wheels for cushion tires. The shells could be very thin and light, if made of good material, and could be put on over a narrow wooden rim. It would increase the cost a trifle, but such a wheel would work well on sandy soils.

GEO. E. WELLS.
Roseland, N. C., Oct. 14.

[Unless there should be a very great demand, such a tire would be very expensive. It would, as you say, be a good thing on some sandy soils.—ED.]

A STANDING JOKE.

I have a stand standing on the stand where it was standing last year. I want to destroy this stand and put another stand in its stand, and yet the stand is good and would stand for years where it is standing were it not for the stock of the stand.

Chicago, Ill. J. T. HAMMERSMARK.

[I commit you to the tender mercies of Dr. C. C. Miller. He may fire a Straw at you from his Straw-stack; so, beware of

the straw that broke the camel's back.—ED.]

SCREW EYES FOR FRAME-SPACERS.

I am interested in the discussion of a simple spacing-device for brood-frames. Instead of the staple suggested on page 890 I would prefer a screw in the form of an eye (hook and eye). I think this has the advantage of a staple. You can screw it in with your fingers, and you can regulate the spacing conveniently. W. S. SHEPHERD.

Shaker Station, Conn., Nov. 28.

[But you will find, if you try them, that a size having the right head to bring about the proper spacing would be so small it would be very frail. The staple has the advantage of *two* legs, while the eyes would have only one leg, and that a screw. There would be another disadvantage, in that it would be a very slow job to attach such spacers to frames.—ED.]

MOVING BEES IN WINTER.

I have a few hives of bees I desire to move about 40 feet. When would be, in your judgment, the best time to do it, with the least loss of bees? W. H. KERR.

Crawfordsville, Ind., Dec. 5.

[The best way for you to move your bees would be to put them in a cellar and keep them over winter. When you set them out next spring, set them in the new location, and all will go well. If you leave them outdoors, and then attempt to move them, when the first warm day comes they will be likely to go back to their old location; while if they were confined several months to the cellar they would go back to their hives no matter where they would be.—ED.]

BEES LEAVING THE HIVE BECAUSE OF PAINT.

Do any of the GLEANINGS family know any thing about "powder paint," or a water paint called "Acme," "Crown," etc.? I painted two hives with it, and the bees left, though there was brood in the combs. The entrances were rather too large, though. This paint is "not designed for roofs or inside work," as the advertisement states, so I thought it might be poisonous.

Corona, Cal.

W. S. RITCHIE.

[I should doubt very much whether the paint had any thing to do with it. If you try it on other hives next summer, I think you will find the bees will stay in them just the same.—ED.]

DISAPPEARANCE OF QUEENS.

Answering S. Longmir's inquiry, page 715, disappearance of queens, this is caused by a quick short flow and sudden cessation, bringing about exact superseding conditions. It always happens in bad years, or years with many interruptions in the honey-flow.

Vigo, Texas.

J. E. CHAMBERS.

If it be possible, as much as lieth in you, live peaceably with all men.—ROMANS 12:18.

When I started that new home in the woods I have talked so much about, I told you I resolved to have pleasant relations with all of my new neighbors if it was a possible thing. Then there was another big reason why I should set a good example before this people, in avoiding anything that had the *appearance* of jangle or ill feeling. When I gave them a talk in the little church one Sunday evening I used for my text, "Love ye your enemies; do good to them that hate you." I spoke about returning good for evil, and conquering even bad people by love. I had a pretty good houseful to talk to. Now, after that talk it would look very bad indeed for me to have difficulty or disagreement with any one in that vicinity. These good friends would be sure to tell me to practice what I preached on that Sunday evening. They would be sure to say, "Mr. Root, you have told how you triumphed over enemies and all other difficulties away down in Ohio, and we shall expect, of course, you will demonstrate the correctness of your teaching by the daily life you live here among us."

You see I had not only gone *through* the bars, but I had *put them up behind me*, as it were. Once when I was talking to a class of rough boys, and striving to show them the beauty of returning good for evil, and turning the other cheek when somebody strikes you, one youngster said at the close, "Mr. Root, do you mean to say that, if anybody hits you, you are not going to hit back?" I told him I should try hard not to hit back. He drew in a long breath, and his face expressed that he thought it was a pretty big undertaking, and added, in an undertone, "Well, *may be* you would; but I should like mightily to see somebody try it on you."

I have often thought of this remark. I do not know that I have had any downright *blows* to test my temper from that day to this; but I have had some pretty severe trials, or at least so they seemed to me.

Now, I wish to tell you a little story; and may God give me grace to tell it without bias, and without letting selfishness creep in to make me screen myself and lay the blame on my neighbor more than it should be laid on him. As I undertake this task I know my weakness. Thousands of times I have tried to tell of some difficulty I had with somebody, and to tell it ingeniously—to tell it without screening myself, and without laying more blame on the other party than he deserved. I tell you, friends, this has been a hard thing to do. You have some complicated transaction with a neighbor. It is as natural as to breathe to tell people

who inquire about it, how *good* and *fair* and kind *you* have been in the whole matter, and how selfish and unjust and unfair your opponent has been. Without meaning to, you tell everybody what an exceedingly good man *you* are, and what a very bad man the "other fellow" is. Selfishness keeps following me up, coming close beside me—yes, even whispering over my shoulder, suggesting certain words and expressions that will just about fill the bill. Just as soon as I begin to tell the story I find he (self) is right at hand, and before I know it he is getting in his work. I chase him off, and think he is clear out of the neighborhood; but just as soon as I become once more absorbed in my topic he is there when I least suspected him. It makes me think of a dog that belonged to a bee-keeper whom I was visiting. He was not going to let me come in the gate; but after the family had called him away he kept slipping back noiselessly, and sniffing at me, smelling of my feet and clothing in a sort of snarling suspicious way. The family remonstrated with him, but he seemed to think he knew what sort of a chap I was better than they did. (I have wondered sometimes if he was not right and they wrong.) He evidently did not like the *smell* of me; although I have always *tried* to keep sweet and clean, especially when I was visiting bee-keepers. They ordered him away several times. Finally my good friend the bee-keeper told me to give him a good kick and then he would go off and *stay* away. Well, he had annoyed me so much I could have kicked him with exceedingly good grace; in fact, I fairly ached to give him "one" under the chops. I just *craved* to hear him go *howling* off with pain; but you know it would not look well for A. I. Root, after all his talk and teachings, to be seen kicking viciously at a dog, even if the dog's owner had advised so doing. So I put up with it and actually forgot all about the dog several times, when all at once I became conscious of something touching my clothing—first one spot and then another; and then the folks would say, "Why, what does all that dog? We never knew him to hang around one like that before, and to be so suspicious. Usually, after he has satisfied himself that somebody he had not seen before is all right, he goes and lies down, and behaves himself."

I declare, I do not know but I am almost "giving myself away" in telling this little incident; but it can not be helped. To-day, at least, I want to stand honestly before you all. May be I have some good traits. If so, I thank God for them; but there are lots of grievous imperfections, and may be your sympathy will help me to do better if I own up. I am now going to try to tell you my story; but the temptation all through will be so great to make it appear that I am a very fair and liberal sort of man I am afraid it will be biased in my favor *in spite* of any thing I can do. Satan, in the shape of self, will be hanging around me

all the way through (just like that dog); and even if I should stop my story to chase him clear off the farm, or even clear out of the county, I am afraid he will be back the next instant. And by the way, dear friends, it has occurred to me that the prince of darkness travels, especially when he is up to mischief, about as fast as the electric waves Marconi has invoked; and with this long preface I will begin my story.

Last spring I was planning, as you may know, to have a summer outing in the Traverse region, and I was very anxious indeed to have a couple of acres of potatoes on that forty acres in the woods. I wrote to my young friend Orville to find somebody, if he could, who would plow the ground on that piece that had not been plowed for over twenty years. I told him, also, to get a man somewhere in the neighborhood to cut down the sprouts and grub out the roots so as to get the land in fair trim. But the teams and farmers were all so busy he said he did not know whether he could get anybody or not. Along toward July he wrote me he did not believe he could find anybody unless it was one man near by who *might* get around to do it. Another thing, I could not get away from home, and so, even if the ground was plowed, I should not be there to plant it. I wrote to Mr. Hilbert that if Orville *should* get the ground plowed, and if he had time and any potatoes left after his own planting, to get in some potatoes on my place if he could. If he could not do so handily, let it go and I would sow the piece to clover in August, as many farmers do in that region.

Well, one beautiful morning along the latter part of July I called at Mr. Hilbert's, and one of the first questions was as to whether any plowing had been done. He said he really did not know. If it had been done he was too busy at home to do any thing with it. I then said if it was plowed I would put in clover; if not, I would try myself to have it done. Then I went away with a light heart through the well-known path down through the woods, wondering if I should see some plowing done over by that spring or not. To my great surprise, I found not only a plowed field of toward two acres, but a growing crop on it. Part of the field was planted to beans and the rest to potatoes. In much surprise I went over to the residence of Orville, whom I had employed to look after my property. Now comes the part of my story that is going to test my ingenuousness. May God give me grace. Orville said the man who did the grubbing put in the beans and potatoes. We will call this man Mr. Brown, for convenience. Orville said he told him he had better not do it without writing to me. Mr. Brown replied that, if he took time to write me, it would be entirely too late to get in beans or potatoes either. He further said that he understood from one of the Hilbert family I had written to Mr. Hilbert that I was too busy to get away, and that Mr. H., or anybody else might have the use of the

ground if they would plant it. You see it was comparatively new ground, and considerable labor would be needed to keep the crop in any kind of condition; and this first crop (at least so Mr. Brown thought) would break up the tough sod so as to fit and make it really better for the crop another year.

Now, Mr. Brown's statement was pretty near the truth, but it was not quite the truth. Very likely he so understood it. He did not see Mr. Hilbert himself, because Mr. H. was absent; but he did see Mr. Hilbert's son. The latter had not seen the letter I wrote—he only knew I had written something; but young Hilbert did not know any thing about what I said about putting in clover in August. Well, I was rather glad to see a crop on the ground, even if it was not mine. I supposed that, of course, Mr. Brown expected to give me some sort of share for the use of the ground, for I had paid \$8.25 for having it plowed. Now, I confess I felt a little surprised and somewhat hurt when Mr. Brown said that he had not intended to give me any share, as no crop would have been on the ground if he had not taken hold of it. In fact, he said it would not even have been *plowed* if he had not volunteered to help the man by cutting the roots and small trees out. At this I said, "Well, Mr. Brown, you put in several days, as I understand it, in grubbing and cutting out the roots, etc. Of course, you will allow this as rent for the use of the ground." To my surprise, he declared that I would have to pay him some five or six dollars for this work, as I had agreed, besides giving him the use of the land.

Now, do not be too hard on Mr. Brown. I think I could take his side of the case, and make it look pretty fair and reasonable. By the way, when I gave that little talk in the church Mr. Brown and his wife and children were all present. The question that confronted me was not what would be fair as *men* generally do business; nor was it what would be fair according to the opinion of the neighbors or those who knew of the transaction. The question that confronted me was what course I should pursue that would be most pleasing in the eyes of the great Father above. The old patriarch Abraham, in pleading with God, said, "Shall not the Judge of all the earth do right?" I like to think of this, and I like to think that the same great Judge who can not err is watching *us* with loving kindness. Shall not we in like manner *do right* in his sight? On page 650 of GLEANINGS for August 1, last year, I alluded to this transaction. I spoke about kneeling on the summit of that big hill as the morning sun was just shedding its beams over all that part of the earth. I told you of praying for this brother, and that in a few minutes more the matter was pleasantly settled. I will tell you now how it was arranged. I went down to Mr. Brown's and told him that the matter of his crops on my land was

left unsettled the day before, and that I should like to take it up again. He said, "All right."

"Mr. Brown, when you decided to plant the beans and potatoes on my ground, without my knowledge or permission, you must admit that you 'took your chances'—at least to some extent—as to whether I would be pleased or displeased with what you did."

"Yes, Mr. Root, I did, as you say, 'take my chances.'"

"Well, I am sorry to feel obliged to say that I am not pleased, especially as I had planned putting in clover, and now your crop is in the way."

He replied I was right, and that he had not been told any thing about my plans for clover. Of course, he would have to stand to whatever arrangements I made. I then told him that, if he would give his bill for the work of helping the man plow the ground, as rent, we would call it all settled. He said that was all right, and he worked for me quite a little during the summer, and our dealing was all quite satisfactory, for he was a very skillful man, and in many things a very efficient helper. The neighbors got hold of the matter, however, and several times I was questioned about it. Two or three times I spoke well of Mr. Brown, and said the whole transaction was fixed up satisfactorily to both of us. Now, I should have *stuck right to this*, and should not have listened to anybody who wanted to take my side in the matter, and to prejudice me against Mr. Brown. That is one of my weak points, and I am afraid it is a weakness of all the world. When you have had trouble with a neighbor, and it has been fixed up, even if only fairly satisfactory to both sides, for goodness sake, *let it drop*. Do not rake it up again. Do not let anybody, by expressions of sympathy, induce you to go over the ground any more and tell you how *you* did and how *he* did.*

Let me add that, when the subject was dropped, I remarked, on leaving, "Now, Mr. Brown, as I shall give up putting in clover, I think I will try to get in some rye after you get off your potatoes and beans, and I hope you will get them out of my way just as soon as the crop is ready to harvest, or as soon as it is injured by frost."

If I mistake not he said he would do so, of course. During the last of October I plowed up the land adjoining, sowed my rye, and when a killing frost came I urged him to get off his stuff so I could finish my fall work and go back to Ohio. Just at this time a vessel came up to the dock for a

load of lumber. He is an expert in this line of work, and gets 40 cts. an hour for it, while I paid him only 15 cts. an hour for farm work. But I had engaged a man to plow up the two acres and put in rye when the ground was ready. I did not expect him to drop his 40-cents-per-hour job, but I went down to the dock and asked him if he would permit my men to dig his potatoes and pull his beans if we would do it at a very low price. He objected, for the reason that, when he was through loading the boat, he would have comparatively nothing to do. Meanwhile his good wife, however, with the help of the children, pulled the greater part of the beans, so my man got in with his plow on his \$8.00 job. When he was ready, however, to get on the potato ground, Mr. Brown was thrashing the beans, and did not want to stop. My plowman lived several miles away; and if he did the job for \$8.00 he wanted to finish it right up while he was there with his tools. I went down to see Mr. Brown while he was thrashing the beans, and explained the circumstances. Said I, "Mr. Brown, if you would let your beans go for the present, and get those potatoes out of the way at once, it would save your neighbor, who is plowing, quite a little annoyance, and also quite a little money, unless I pay him for going home and coming back."

He replied that the neighbor in question had not been in the habit of doing him a kind act when he could as well as not, and therefore he would not trouble himself.}

"Mr. Brown, do you not believe in the good book which says, 'Love ye your enemies, and do good to those that hate you?' Don't you think it pays to return *good* for *evil* among your neighbors?"

"Why, Mr. Root, I used to believe in that sort of doctrine, and I have followed it up all my life so far; but it has just made me a poor man, as you see, and I think now I will give it up and try the other way."

I had to laugh at this, because I could not believe he was in earnest. Said I, "Mr. Brown, I *too* have tried both ways; but rendering good for evil has not made *me* poor by any means, and I am sure it will not make you poor if it is followed out consistently."

I had to give it up. I waited his pleasure in digging the potatoes. Some of the neighbors advised me to go on with the plowing, and turn the potatoes under, when they were worth 75 cts. a bushel. Of course, I could not consider such a plan for an instant. Wasting his potatoes, or making it ever so much more work to get them, would have wronged his wife and children; besides, it would have made troubles and jangles in the neighborhood for a long time. Our families had been on very friendly terms. Mrs. Brown, only a few days before, sent us a large basket of the nicest tomatoes I think I ever saw. The children to and from school pass very near our house, and often brought our mail. What a foolish thing it would be to make bad feelings

*Our pastor recently gave us a sermon on the text, "Love ye your enemies," etc. At the close he alluded to the 17th verse of the 18th chapter of Matthew, where we are told that, if one will not listen to the church (or to arbitration), we are to give him up as a heathen. He said whenever we do meet a case as bad as that we should be very careful to drop the matter then and there for ever. Do not go around telling it to the neighbors; do not mention it any more, even before the family, and I think this advice is very much needed everywhere. "Least said soonest mended" is a grand maxim.

all around, and do a wrong to innocent parties, just for the sake of saving a few dollars and getting a crop of rye in a few days earlier! Mr. Brown very soon got at his potatoes; and when he did, they came out in a hurry.* I had a boy working for me at much less pay than I gave Mr. Brown. He said if I would let the boy help him get the potatoes out he would give me a day's work of his own in exchange for the boy, even up; and the matter ended pleasantly. I think—oh how much more pleasantly than if I had asserted my rights and practiced something I did not preach or teach on Sunday! No doubt Mr. Brown could mention some things I did that were not very kind and not very wise; but I think he feels friendly enough toward me now so he will not feel hurt, even if he should see this in print; and I hope he will realize, with all the rest of you, that I have told this little story only because it shows how easily neighbors may quarrel if even one of them harbors a disposition to return evil for evil; and it shows, also (at least I hope it does) how easy it is to get along pleasantly where even *one* of the two parties concerned (you know it takes *two* to make a quarrel) really believes in that beautiful text that says, 'Love ye your enemies, and do good to those that hate you.' Conquering by kindness instead of by force and hard words or blows, is one of the very foundation stones of the gospel of Christ Jesus which he came to proclaim here on earth to a sinful world.

LYNCHING, ASSASSINATION, AND OTHER ACTS DISREGARDING THE LAWS OF OUR LAND.

I am sorry GLEANINGS could not say one word concerning the assassination of the President of the United States. J. G. BROWN.
Greentown, Ind., Jan. 1, 1902.

My good friend, it was not because I did not have any thing to say that I was silent. But somewhat, perhaps, because there has been so much said about it in every periodical one picks up. Perhaps I am rather late about it, but there is one thing that ought to be said, and yet I have not found very much said about it. When the lynching business got to be so bad, and especially when people, not only in the South but in the North, East, and West, seemed to think it was *the* thing to take the law into their own hands, and even *put a man to death* where a lot of people thought he ought to die without judge or jury—ever since these things have been getting to be so common, and especially as many good people seemed to think there was nothing so very wrong about it, I have had a feeling

*By the way, friends, the next time you have trouble with a neighbor, instead of dwelling on unpleasant memories of times past, just set about hunting up the good things, or the favors that he and his family have shown you. Hold up the good traits, the pleasant transactions, and push the others out of sight. Keep self and selfish interests away off. Chase them away as I did that dog—oh, no! I did not chase him, after all; I only wanted to, but feared it would not look dignified.

that, sooner or later, we should *reap what we have been sowing*. As soon as I heard of the President's assassination, I said at once that was the outcome of the lynching business and *other* growing tendencies toward anarchism. It rejoices my heart to see how universally anarchy and every tendency toward it is being condemned, and I hope the people of our land will catch on to the fact right speedily, that lynching is anarchy and nothing else. It is condemning a man and putting him to death without trial; and oftentimes the hanging or burning at the stake is done by some wretch or set of wretches who are but little better at heart than the man they are putting to death. Let us uphold the laws, and set a good example by obeying them. If the laws are bad or slow, go about it in a loyal and orderly way to right the wrong. But let us not do any thing contrary to law, nor in any way *ignore* and *trample under foot* our laws.

THE UNITED STATES DEPARTMENT OF AGRICULTURE.

Is it the wish of the people that this Department shall push the tobacco industry?

Friend Root :—I inclose you a slip that is going the round of the papers, which no doubt you have seen, and I am certain will interest you as it does me.

WASHINGTON, Oct. 27. Secretary Wilson announced today that experts of the Agricultural Department will hunt all over the United States and its new possessions for conditions favorable to the cultivation of the filler tobacco, such as is now raised in Cuba, so that, if possible, all the filler tobacco used in this country eventually may be raised within the boundaries of the United States.

"The United States," he said, "is now paying \$8,000,000 for wrapper tobacco. We have succeeded in finding in this country the conditions under which all the wrapper tobacco we need can be raised here, and experts of the Department of Agriculture for the first time are seeking soils adaptable to the cultivation of the fine filler product. We have parts of Pennsylvania, Ohio, and Texas selected for the investigation of our experts, and land for similar purposes will be selected in all our new island possessions, with a view to ascertaining how and under what conditions the filler product can be built up here."

I think sometimes that, if the W. C. T. U. and other kindred temperance organizations would drop some parts of their work, and in its place work against tobacco, they would do far more real good.

The tobacco habit is gaining faster than the liquor habit, and I, I think, the cause of more suffering in the aggregate. Then it is the great stepping stone to intemperance. For our young boys tobacco is first, the saloon next. Only yesterday, on a ride into the country, we met three boys, schoolbooks in hand, one with a pipe and one with a cigarette in his mouth, and scarcely twelve years old, and this is common.

Everywhere we come into the tobacco atmosphere. No persn can avoid it for a single hour unless he stays in his own home. Invalids or delicately organized women are often made almost or absolutely sick by a nuisance they can not avoid, while it is very seldom that any one is annoyed by intoxicating drink or intoxicated persons.

Some may say the tobacco user does not come home and abuse his wife and family, even to blows. But think for a moment of a delicately organized woman, always in her own home, surrounded by and breathing a tobacco atmosphere, brought there and maintained by a devoted husband soaked through and through with tobacco, doomed to a slow and almost certain death, and scarcely any one laying it to the real cause.

Occasionally, by some mysterious act of Providence (?) the husband may happen to go first. Then, to the surprise of every one, the bereaved wife's health immediately commences to improve. This is no overdrawn or singular case, but is happening all around us—but the wife generally dies first.

Then the undermining of the health of our youth is, I think, far greater than all the damage done by liquor alone unaided by tobacco.

Did you ever think how even the women who think intemperance such a curse could almost alone, if really in earnest, stamp out both intoxicating drink and tobacco? Simply refuse to have any thing whatever to do with the user of either; but it must be absolute, always, and unrelenting. They will not do it, even as individuals. Are they really in earnest? Actions count; words, but little.

For the best way, if we could only find it, I am

Sincerely yours,
Conneaut, O., Nov. 2 D. CUMMINS.

No information is given as to what paper the clipping referred to, given in small type, came from. It is indeed a sad state of affairs to contemplate. The educators of our nation, teaching in all our schools and colleges the effects of tobacco on the human system, and at least to *some* extent warning our boys against the habit, and right while this is going on the Secretary of the Agricultural Department of Washington is using government money to push this industry, not only throughout the United States but even into our new possessions, the islands of the sea! The trouble *can* be met; and, through the grace of God, it *must* be met. We can not put the whole burden on the shoulders of our women, even if they are not as a rule tobacco-users. But every man who loves righteousness, temperance, and purity, and who hates iniquity, must enter his protest, and that right vigorously, and then the reform will come, and we have God's promise that we *shall* reap in due time if we faint not.

MAKING GOOD MEN AND WOMEN; THE CHEAPEST WAY TO DO IT.

The following gem from the *Promoter*, of Grand Junction, Col., for January, comes in nicely with the notice I gave in our last issue of Miss Remington's work among the children:

The costliest way of making good men and women is that which looks toward reforming them after they have started out on the wrong track. And it is so uncertain too. The time to start a tree growing straight and true is before it has begun to go wrong.

150 Kinds for 16c.

It is a fact that Salzer's vegetable and flower seeds are found in more gardens and on more farms than any other in America. There is reason for this. We own and operate over 500 acres for the production of our choice seeds. In order to induce you to try them we make the following unprecedented offer:

For 16 Cents Postpaid

- 20 kinds of rarest luscious radishes,
- 12 magnificent earliest melons,
- 13 so delicious tomatoes,
- 24 peerless lettuce varieties,
- 12 beautiful beet sorts,
- 62 gorgeously beautiful flower seeds.

In all 150 kinds positively furnishing bushels of charming flowers and lots and lots of choice vegetables. Together with our great catalogue tell you all about Peasants and Peasants and Bromus and Speltz, onion seed at 60c. a pound, etc., all only for 16c. in stamps. Write to day.

JOHN A. SALZER SEED CO.,
La Crosse, Wis.

Sections

\$1.50

January 1 we commence making extensive improvements in our factory and warehouse. The following regular No. 2 sections are on hand, and we desire to sell them before beginning the improvements, as they will be in the way. In order to sell them quickly, we make the low price of \$1.50 per 1000 in any quantity.

- 120M $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ inches.
- 28M $4\frac{1}{2} \times 4\frac{1}{2} \times 2$ inches.
- 31M $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ inches.
- 35M $4\frac{1}{2} \times 4\frac{1}{2} \times 7$ -to-the-foot.
- 21M $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ inches.
- 22M $4\frac{1}{2} \times 4\frac{1}{2} \times 7$ -to-the-foot.
- 43M $4\frac{1}{2} \times 4\frac{1}{2} \times 7$ -to-the-foot.
- 25M $3\frac{1}{2} \times 5 \times 1\frac{1}{2}$, no-beeway.
- 16M $4 \times 5 \times 1\frac{1}{2}$, no-beeway.
- 52M $4\frac{1}{2} \times 4\frac{1}{2} \times 1\frac{1}{2}$ no-beeway.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

A. E. OUTERBRIDGE & CO., Agents.

39 Broadway, New York.

ARTHUR AHERN, Sec., Quebec, Canada.

Revised Price List of Garden Seeds for Jan. 15, 1902.

PLEASE NOTICE that any or all seeds mentioned below are sold in five-cent packages, postpaid, by mail. For ten papers ordered at one time, 40 cents; 100 papers, \$3.50. Of course, scarce and high priced seed will necessitate making a very small amount of seed in a package; but by far the greater part of them contain a full half ounce of good fresh seeds. By comparing these packages with those you get of any of the seedsmen you will notice the liberal amounts we furnish for only 5 cts. It is true, we do not give presents or cash prizes; but we believe the most intelligent people of the present day would prefer to have their money's worth of what they ordered rather than compete for a prize. The five-cent packages are sent postpaid; but the price of all other seeds does not include postage; therefore, when you order seed by the ounce or pound, allow postage thus: 9 cts. per lb.; 5 cts. per $\frac{1}{2}$ lb., or 1 ct. per oz. Peas and beans by the pint and quart must also have 8 cts. per pint or 15 cts. per quart; for corn, add 12 cts. per quart for postage. Postage to Canada is double the above rates. One-fourth ounce, pound, or peck will be sold at ounce, pound, or peck rates unless otherwise specified.

ASPARAGUS.

Asparagus, Palmetto. Oz. 5c; lb. 40c.

BUSH BEANS.

Burpee's Bush Lima. Pt. 15c; qt. 30c; $\frac{1}{2}$ pk. \$1.00; bushel, \$3.50.
Henderson's Bush Lima. Pt. 8c; qt. 15c; pk. \$1.00; bushel, \$3.50.

Wood's Improved Bush Lima. Pt. 20c; qt. 35c; pk. \$2.00. An improvement on Henderson's, and larger.
Davis Wax Bean. Pt., 8c; qt., 15c; 4 qts., 55c; pk. \$1.00; bushel, \$3.75.

Dwarf German Wax, black seeded. $\frac{1}{2}$ pt. 8c; pt. 12c; qt. 20c. Perhaps the best wax bean, and very early.
Prize-winner Extra Early Shell Bean. $\frac{1}{2}$ pt. 8c; pt. 12c; qt. 20c; $\frac{1}{2}$ pk. 65c; peck \$1.25.

This is not only the earliest shell bean we have ever come across, but it is a tremendous yielder, and the best quality of any white bean we know of. It is so exceedingly early that in the season of 1900 we grew two crops on the same ground and the second crop was from beans that ripened from the first crop.

White Kidney, Large. Pt. 8c; qt. 15c; pk. \$1.00; bu., \$3.50.

Red Kidney Beans. Same prices as white.
York State Marrow. The standard field bean. Qt. 10c; pk. 75c; bushel, \$2.75.

Banner Field Beans. Qt. 10c; pk. 70c; bushel, \$2.75.

SEED POTATOES FOR SPRING OF 1902

Prices on seed potatoes for planting in 1902 will be as follows: ½ peck, 25 cts.; peck, 40 cts.; ½ bushel, 75 cts.; bushel, \$1.40; barrel, \$4.00. Small seconds, half the above prices. I have been watching quotations for several months, and no reliable seedsmen has made any better prices. We will ship them (when they go south (where wanted) before April 1, 1902), at the above figures; or we will keep them safely for you till next spring; or we will specially arrange potato-cellar. We can furnish, at the above prices, White Bliss Triumph, Early Ohio, Bovee, Sir Walter Raleigh, New Russet, and Craig. As our supply of manys is limited, you had better order at once if you want them. Seed potatoes, especially the earlies and extra earlies, are likely to be away up before another spring. Our seconds will probably all be gone very soon at the above low figures. These seconds are not all small potatoes. In sorting we have put badly shaped and scabby potatoes into the seconds. Some of these latter are of very good size, and will be cheaper for table use at the price (\$2.00 per barrel), than any thing else you can probably get in the market. Of course, it is a little more work to prepare them for the table; and a part of them will be rather small for table use; but at the above price you are to take them as they come—all potatoes not strictly fit for A No. 1.*

OTHER POTATOES IN SMALL QUANTITIES.

We can furnish the following kinds in small quantities, say not to exceed a peck or half a bushel: Early Trumbull, New Queen, Lee's Favorite, Freeman, State of Maine, Maule's Commercial, Carman No. 3, White Mammoth, Early Michigan.

Any of the above potatoes will be furnished in very small quantities at 5 cts. per lb., or by mail at 15 cents per lb., or 3 lbs. for 40 cts. Potatoes for premiums can be sent by mail, but 10 cts. per lb. extra for postage and packing will be required.

POTATOES AND GARDEN SEEDS TO BE GIVEN AWAY

Everybody who sends \$1.00 for GLEANINGS (asking for no other premium) may have 25 cents' worth of potatoes, seeds, etc., providing he mentions it at the time he sends in the money; and every subscriber who sends us \$1.00 for a new subscriber so that GLEANINGS may go into some neighborhood or family where it has not been before, may have 50 cents' worth of potatoes, seeds, etc.; but you must pay all postage, express, or freight on your premiums. We can give away potatoes, etc., but we can not give away postage stamps.

GRAND RAPIDS LETTUCE SEED—TWO BUSHEL BAGFUL.

Some of our friends doubtless remember when I paid \$50 for a single half-pound of this lettuce seed. Well, I do not know that I ever invested \$50 in my life

* Mr. E. T. Flanagan, of Belleville, Ill., had two barrels of these seconds, and was so well pleased with what we put in seconds he wrote: "If these are what you call SECONDS, I wonder what the firsts are like."

where it did more good to the world in general than when I scattered that half-pound of seed in little pinches all over the face of the earth. During all these years that have passed, the industry of growing Grand Rapids lettuce under glass has been steadily increasing; and I do not know of any venture in this direction that has ever proved to be a failure. Just now we have a two-bushel bag of seed grown expressly for us in California. We have the plants now growing in the greenhouse, and it is certainly the finest strain of seed I ever got hold of—that is, by the quantity. If you wish to get lettuce out so as to take in the big spring market, now is the time to sow the seed. You can start the plants in the house, in shallow boxes, if you can not do any better. Put them in cold frames well protected; or, better still, put in some stable manure, and get a little bottom heat if you wish to push them along. Hot beds and cold-frames are especially adapted to this lettuce; and if you have not glass, a great deal can be done with cotton cloth, as described in the tomato book. Of course, a little greenhouse (or a big one) is the nicest way to work it; and just now I do not know of any prettier or more interesting business in the world than growing Grand Rapids lettuce in a greenhouse. With very rich soil the seed will come up in four days; and in four days more it may be transplanted so as to give the little plants more room; that is, you can do this where every thing is just right.

The price of this extra nice seed is, 1 oz., 5 cts.; 1 lb., 50 cts.; 5 lbs., \$2. By mail, 10 cents per lb. extra. We shall be glad to send you the seed by return mail.

PRICES ON CLOVER SEED AT THIS DATE.

Although the market is not very well settled as yet for 1902, as nearly as we can make out the prices will be about as follows. But let it be understood there are liable to be fluctuations, and we can not be responsible unless for immediate orders.

Alsike clover, bu., \$10; ½ bu., \$5.25; peck, \$2.75; 1 lb., 20 cts., or by mail 30 cts.

Medium clover, bu., \$7.00; ½ bu., \$3.75; peck, \$2.00; 1 lb., 15 cts., or 28 cts. by mail.

White Dutch clover is the same as alsike.

Peavine, or Mammoth Red clover, same as medium. Alfalfa, bu., \$6.00; ½ bu., \$3.25; peck, \$1.75; 1 lb., 15 cts., or 25 cts. by mail.

Crimson, or scarlet clover, bu., \$4.50; ½ bu., \$2.40; peck, \$1.25; 1 lb., 10 cts., or by mail 20 cts.; 3 lbs. by mail, 50 cts.

Sweet clover, 100 lbs., 10 cts. per lb.; 10 lbs. at 12 cts.; 1 lb., 15 cts.; by mail, 25 cts. per lb.

MARCH'S IMPROVED MATTITUCK ERFURT CAULIFLOWER SEED.

MR. ROOT:—Last year I got a small quantity of cauliflower seed from you that did extra well for me. I have forgotten its name, but you said you had but a limited amount of the seed. If you know what it was from this, and have any more of the same strain this season, please send prices. Warrensburg, Mo., Jan. 7. M. F. PARKER.

Friend P., the seed you had was as above. We have now a fine stock of exactly the same thing. ½ oz., 30 cts.; ¼ oz., 50 cts.; 1 oz., \$1.75. There has been such a tremendous demand for this new improved strain of Early Snowball (for that is what it is) the price has advanced somewhat, as above. Everybody seems to give the same verdict you have in regard to it.

The A. I. Root Co., Medina, Ohio.

WANTED. Comb honey in any quantity. Please advise what you have to offer. EVANS & TURNER, Town St., Cor. 4th, Columbus, Ohio.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHEIM, 1318-1324 Union Avenue, Kansas City, Mo.

Union Combination Saw

For Ripping, Cross-cutting, Rabbing, Mitering, Grooving, Gaining, Boring, Scroll-sawing, Edge-moulding, Beading. Full line FOOT and HAND POWER machinery. Send for catalog A.

SENECA FALLS MFG. CO., 44 Water St., Seneca Falls, N.Y.

The Storm Proof KING WIND MILL

produces 250-500% more net power from any kind of wind than any other mill made. Wheel being only 1 in. thick cuts the wind like a knife and is 400% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11 Medina, O.

Wagon World Awheel.

Half a million of these steel wheels have been sent out on our own wagons and to fit other wagons. It is the wheel that determines the life of any wagon, and this is the longest lived wheel made. Do you want a low down Handy Wagon to use about the place? We will fit out your old wagon with Electric Wheels of any size and any shape tire, straight or staggered spokes. No cracked hubs, no loose spokes, no rotten felloes, no resetting. Write for the big new catalogue. This free.

Electric Wheel Co., Box 95, Quincy, Ills.

FRUIT INSURANCE.

I guarantee every plant, vine, etc., which I sell to be strong-rooted, Healthy, Hardy, Dormant Plants. Raspberry, Blackberry, Gooseberry, Currant, Strawberry, etc. All fresh dug as shipped—no heeled-in stock. New 1902 FREE Catalog contains all standard and many new varieties.

WANTED TO SELL!

40 acres of best fruit and vegetable hammock land on Manatee River, Fla. This land is same class and near the Ellenton hammock spoken of in GLEANINGS, page 855, Nov 1, 1900, "Profitable Yield of Grape Fruit." This section is noted for *extra success* with citrons, fruits, and vegetables. Manatee River is the most attractive body of tide water in Florida. I have held this land at \$100 per acre, but owing to old age and broken health, will take \$1400 for the entire tract; 10 acres under fence (wire).

J. E. DART, Connesauga, Ga.

White Wyandottes!

Bred from Dustin's best. Some fine cockerels on hand already to ship.

J. F. MOORE, : TIFFIN, OHIO.

BELCIAN HARES!

With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge. Does will be bred to one of our famous high-scoring bucks free. Write for book. Mer. of The A. I. Root Co. **J. B. MASON, MECHANIC FALLS, MAINE.**

Queens! Untested, \$1.00; tested, \$1.25 and upward. See former ads. and circular. **J. B. Case, Port Orange, Florida.**

FOR SALE.—Will sell cheap, one 10 h. p. engine with upright boiler all complete. **J. W. BITTENBENDER, Knoxville, Iowa.**

FANCY EXTRACTED HONEY.—An extra-fine lot of clover honey that I had reserved for bottling, but owing to change of plans will sell in bulk. From combs entirely capped and fully ripened, thick and rich. Now candied perfectly hard and dry. Cans hold 74 lbs. net. Per can, \$5.50. Fancy comb honey, 22 lbs. in case, per case, \$3.50.

\$1 DOES THE WORK OF \$2

The Ohio Farmer 2 Years \$1, or 1 Year 60 Cts

Any farmer, no matter where located, will find THE OHIO FARMER the largest, most reliable, instructive and valuable agricultural journal of America. It has 20 pages, every week, filled with the practical experience of the largest staff of editors and correspondents of any farm paper in the world. It is published solely for business farmers, who depend upon the farm for their living. It helps make the farm pay! We can give the best farm paper at the lowest price, because we have the largest actual circulation of any weekly farm paper in the world.

Ohio Farmer Always Stops at Expiration of Subscription

We will send you any paper or magazine, at Cut Rates, in connection with THE OHIO FARMER. By special contracts we obtain low rates and give our readers the benefits.

Rocky Mountain Bee Journal,
Boulder, Colorado.

A CORRECTION.

An unfortunate error occurred in our catalog by which it appears that GLEANINGS can be had for 50 cents a year by any one who buys a single article from our catalog, no matter how insignificant in value. It should read that the 50-cent rate can be secured only when parties buy \$10 worth or more of supplies at regular prices. The correction was made while the forms were on the press; but as some catalogs have gone out with the wrong reading, we think it best to mention it here.

MAPLE SUGAR.

We have a very choice lot of maple sugar which, when being made up from syrup, had about 20 per cent of granulated sugar added to make it grain properly. Ordinarily this is not necessary; but this was an unusual lot. We shall be pleased to mail sample to any one interested. Price 10c per lb. In barrel lots of about 30 lbs., 9c. Maple products, both syrup and sugar, are scarcely to be found in the market till the new crop is ready this coming season.

TIN CANS FOR SYRUP AND HONEY.

We have made favorable arrangements for the coming season on tin cans of $\frac{1}{2}$, $\frac{1}{2}$, 1, and 5 gallon capacity, and have just received one car from the factory, and expect another one later. Unless otherwise specified, our cans this year will have $1\frac{1}{2}$ -inch screws without the inner seal. We can supply them with $1\frac{1}{4}$ inch screw a little cheaper if that size is large enough. We shall be pleased to hear from those in need of cans. We will not carry sap-buckets in stock, but we can furnish them direct from the factory at favorable prices. If interested let us hear from you.

HONEY MARKET.

The extracted-honey market seems to be a little firmer than it was six weeks to two months ago. There has been no rain in Southern California since the middle of November, and the outlook for a crop there this season is very poor unless rain comes soon. We have sent out various inquiries for white-sage extracted, but do not find it. We could use a car at the right price. Other honey, both comb and extracted, is selling fairly well. We could take care of more orders for comb honey, as we have quite a large stock. Inquiries solicited.

GLASS HONEY-PACKAGES.

We recently laid in a stock of over 50 gross of Muth square jars with corks, and are prepared to quote special prices on large lots, and to ship promptly.

We have on the way here a carload of Mason fruit-jars and No. 25 and 143 honey-jars. Our orders for these No. 25 jars have increased at such a rate that we have several times the past season disappointed several good customers by delay in shipping their orders promptly. The factory has been slow in filling our orders, and the increased demand has used up stock sooner than we calculated. We hope from now on to keep pace with orders. The No. 25 holds an even pound of honey, and No. 143 about 14 oz. See our catalog for prices.

We have in stock a limited quantity of glass tumblers, pails, and jars, such as we have listed in our catalog for a number of years, and which are omitted from the last edition. We offer these, to close out, at the following prices: No. 788, $\frac{1}{2}$ -pint tin-top jellies, holding 10 oz. of honey, in barrels of 21 dozen at \$1.50 per bbl.

No. 789, $\frac{1}{2}$ -qt., holding 1 lb. honey, 16 $\frac{1}{2}$ dozen to bbl., at \$5.00.

1 bbl. of 16 $\frac{1}{2}$ dozen of each size, nested, at \$8.00.

No. 776 glass pails holding 14 oz. honey, per bbl. of 16 $\frac{1}{2}$ dozen, \$6.00.

No. 777 glass pails holding 17 oz. honey, per bbl. of 12 $\frac{1}{2}$ dozen, \$5.40.

No. 778 glass pails holding 24 oz. honey, per bbl. of 8 $\frac{1}{2}$ dozen, \$5.40.

Also a few jam-jars and oaken-bucket jellies, which we will price to those interested.

Special Notices by A. I. Root.

GOOD AND USEFUL BOOKS AS PREMIUMS TO SUBSCRIBERS.

Any one sending us \$1.00 for GLEANINGS, and asking for no other premium, may have books from the book list in last issue to the amount of 25 cents. And any subscriber who will send us \$1.00 for a new subscriber—that is, where he by so doing starts GLEANINGS going into a new family or a new locality—the subscriber who sends us this new name, without asking for any other premium, may have 50 cents' worth of books from the book list. These offers refer to the books themselves, not to the postage. Send the proper postage for every book you order as a premium.

GROWING TOBACCO; GIVING THE INDUSTRY COUNTERNANCE AND ASSISTANCE.

The first seed catalog for 1902 placed on my table is from our old friend A. T. Cook, Hyde Park, N. Y. It is gotten up in excellent style as usual. But what pleases me in particular about it is a paragraph right in the middle of the book, saying: "Don't ask me for tobacco seed. I do not think it right to raise the vile stuff, sell, or use it." Now, there may be other seedsmen in the United States who have the courage to come out this way before the world—especially when we are told that three-fourths of all the men use tobacco. Very likely friend Cook loses some trade by coming out thus boldly for principle. If so, let us who love righteousness and hate iniquity stand by him and give him encouragement. If there are other seedsmen who have the courage to come out boldly and fearlessly in a like manner, I should be glad to publish their names. Friend C. sells seeds in packets only, never in bulk.

FERRETS FOR BANISHING RATS.

For years we have been troubled more or less with rats and mice. They got into the potato cellars, into the seed-room—in fact, into the basements, more or less of all our buildings. They were baited a good deal by the workmen throwing away fragments of their dinner when they had more than they needed. I tried to stop this, but had to give it up. Well for years past we have kept the vermin down pretty well with a "gang" of cats; but a good many times our people voted the remedy worse than the disease. In spite of every thing I could do the cats were clubbed out of the way, and sometimes shot, before I knew what was going on. Of course, some cats were "brought up" properly; but occasionally we had tramp cats that had no bringing up, and, as it often happens, the innocent ones had to suffer in place of the guilty. Ernest has for a long time urged getting a ferret. Ferrets cost money, and I thought it would be an added responsibility. A few days ago, however, I found a relative who owned a ferret. I telephoned him to come and banish our rats. He feared, however, he would lose his ferret in a place so large as ours; but when I volunteered to pay him for it (price \$3.50) if lost, he went ahead. We first took the potato-cellar. As soon as he was out of the bag he put down under the floors into every rat hole he could find; in fact, he went everywhere a rat could go. Every little while he would come out, or, rather, look out, and take a peep at his owner to see he was not entirely among strangers, and then back he went. We did not see any rats in any of the factory buildings; but in the course of two hours his owner said they were gone, and there would be no more around here for a week or two, for they will always leave as long as the scent of the ferret remains. The next day our teamster informed me that, for some reason unknown, the barn and stables were full of rats. He said he found a good bushel of dirt carried out into one of the stables during one night; and then I remembered I had forgotten all about the barn, for I supposed half a dozen cats would take care of that. We sent for the ferret again, and he went into a rat-hole where they had been digging, "quicker than a shot." I told the boys they had better have some clubs, but they were in too much of a hurry; in about a minute after the ferret went into one hole a rat came out of another. There was lots of stamping and yelling, but the rat got away. Another rat went through the same program, and a third one poked his head out and concluded, evidently, it would be jumping out of the frying-pan into the fire, so he went back. Pretty soon out came the ferret. He was so excited that his master could hardly restrain him; and in just no time he explored every rat-hole and every nook and cranny in the barn. We after-

ward found where the rats had made tracks off through the snow for a "healthier" local ty.

Now, this experience has been worth a good deal to me. If we can have a ferret once in two weeks or once in a month, it will certainly be much preferable to cats. The owner of the ferret says he took one into a barn where there were so many rats they came very near killing the ferret; but after he was rescued, the rats went off in a body, and none have been noticed in or around that barn for more than a year although the ferret made only one visit. One of our advertisers, Mr. N. A. Knapp, of Rochester, O., publishes a book, "The A B C of Ferret Culture," which I have been reading with considerable interest. We can mail it for 12 cents.

CONVENTION NOTICES.

The Wisconsin State Bee-keepers' Association will hold its annual convention in the State Capitol at Madison, Feb. 5 and 6, 1902. The convention promises to be largely attended. Excursion rates of 1½ fare, good for all of the first week in February. All are invited to attend. ADA L. PICKARD, Secretary.
N. E. FRANCE, President.

The annual meeting of the New York State Association of Bee-keepers' Societies will be held in the parlors of the Kirkwood Hotel, Geneva, N. Y., on Wednesday, Feb. 5, 1902, commencing at 10 A. M. All interested in bee culture are cordially invited to be present. Subjects of importance are to be brought before this meeting, and it is desired to have a large representation of bee-keepers in attendance.

W. F. MARKS, Pres., Chapinville, N. Y.
C. B. HOWARD, Sec'y, Romulus, N. Y.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

ALBANY.—Honey market unchanged since our last, with but little comb honey of any kind here. Selling fancy white, 15; No. 1 white, 14@15; mixed, 13@14; buckwheat, 13@13½. Extracted dull except for buckwheat, which is wanted by the Jewish people for their approaching holidays, at 6c. Beeswax, 28@30, with good inquiry.

MACDOUGAL & CO.,
380 Broadway, Albany, N. Y.

NEW YORK.—Market for comb honey is good, with the stock pretty well cleaned up. Small lots coming in now and then which find ready sale and fair prices. We quote comb honey to-day as follows: Fancy white, 14@16; A No. 1 white, 14@15; No. 1 white, 13@14; No. 2, 12@12½; fancy buckwheat, 11@12; No. 1 buckwheat, 10@11; No. 2 buckwheat, 9@10; mixed, 11@12. Extracted honey, demand fair, supply good; white clover and basswood, 6@7; light amber, 5½@6; amber and buckwheat, 5½@6. Beeswax, 27@29.

CHAS. ISRAEL & BROS.,

Jan. 20. 486-490 Canal St., New York City.

CINCINNATI.—The demand for honey is fair. Extracted honey is offered very freely. Dark brings 5; lighter, 5½@6; fancy, 6½@7½. Fancy comb, 15; lower grades, 12½@13½. C. H. W. WEBER,

Jan. 21. 2146 Central Ave., Cincinnati, Ohio.

SCHENECTADY.—Our market is very quiet at present, and well supplied with white clover, but no buckwheat comb honey on hand. We quote No. 1 white 14@15; No. 2, 13@14; buckwheat, 12@13. Stock of extracted greatly reduced but no great demand; light, 6@7; dark, 5½@6.

CHAS. McCULLOCH,

Jan. 20. 1 Eagle St., Schenectady, N. Y.

DENVER.—No. 1 white comb honey, \$2.75 to \$3.00 per case of 24 sections; No. 2, \$2.50 to \$2.65. Extracted, 7@8. To bring these figures honey must be graded according to rules of the Colorado State Bee-keepers' Association. Beeswax, 22@26.

COLORADO HONEY-PRODUCERS' ASS'N,

Jan. 21. 1440 Market St., Denver, Col.

PHILADELPHIA.—Market has been light sales since the holidays. Car of California bottled honey having been sent to this market and demoralized the trade and hurt the sale of good honey for years to come. We quote fancy comb 16; No. 1, 14. Extracted, 6@7. We are producers of honey—do not handle on commission.

WM. A. SELSER,

Jan. 24. 10 Vine St., Philadelphia, Pa.

MILWAUKEE.—The honey trade has not been what it seems should have been thus far this year, but because of the limited demand we continue to expect an improvement in the near future. The supply is not large, and shippers of fancy can ship to us and expect good returns, and we continue to quote fancy 1-lb. sections 15@16; A No. 1, 14@15; No. 1, 13@14; amber, nominal 12½@14. Extracted, in bbls., kegs, or cans, white, 8@9; amber, 5½@7½. Beeswax, 26@28.

A. V. BISHOP & Co.,

Jan. 20. 119 Buffalo St., Milwaukee, Wis.

SAN FRANCISCO.—Comb honey, 10@12; extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 27½@30. The winter in California has been a dry one; in consequence the prospects for the coming season are decidedly blue in the southern part of the State. As the bulk of the honey is produced in that section, prices are stiffening, and will advance unless rains come very soon.

Jan. 9. E. H. SCHAEFFLE, Murphys, Calif.

BOSTON.—Our market continues somewhat dull in the demand for honey, while stocks are ample for the balance of the season, unless there should be a much larger demand than we at this moment anticipate. Prices remain about the following: Strictly fancy, in cartons, 15½; A No. 1, 15; No. 1, 14½; very little No. 2 to offer—stock nominally running No. 1 and A No. 1. Extracted light amber, 7½; amber, 7; Florida honey, 6½@7.

BLAKE, SCOTT & LEE,

Jan. 20. 31, 33 Commercial St., Boston, Mass.

CHICAGO.—The honey market is of a slow nature, with little change in price of any of the grades. Choice grades of white comb honey, 14½@15; good to No. 1, 13½@14; light amber, 12½@13; dark grades, including buckwheat, 10@12. Extracted white, 5½@7; amber, 5½@5¾; dark, 5@5½, the scale of prices varying according to flavor, body, and package. Beeswax steady at 28.

R. A. BURNETT & Co.,

Jan. 24. 199 South Water St., Chicago, Ill.

FOR SALE.—Four 10-gallon kegs white extracted honey, clover and basswood mixed, now candied, price 7½ cts. per lb., f. o. b. here. Also four 10-gallon kegs and five 5-gallon jacketed cans of fine amber honey just extracted, fine flavor and doubly ripened, very thick and waxy, 6½ cts. per lb. Large sample free.

O. H. TOWNSEND, Otsego, Mich.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.

EVANS & TURNER,

Town St., Cor. 4th, Columbus, Ohio.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.

SEAVEY & FLARSHEIM,

1318-1324 Union Avenue, Kansas City, Mo.

FOR SALE.—Fancy and No. 1 comb honey, about 2000 lbs. or more.

WM. MORRIS, Las Animas, Col.

FOR SALE.—Extracted honey, from alfalfa, at 7c per pound. Send for sample.

D. S. JENKINS, Las Animas, Col.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans.

B. WALKER, Clyde, Ill.

FOR SALE.—Clover and sweet-clover extracted honey at 7c, in kegs and cans.

DR. C. L. PARKER

Sta. A, R. F. D., Syracuse, N. Y.

FOR SALE.—1000 lbs No 1 and fancy comb honey.

H. L. LEONARD, Brandon, Vt.

Satisfied Customers,

and their numerous expressions of the superiority of my queens warrant me in continuing the arrangement of my queen apiaries in 1902 as in 1901. I have watched carefully, and have selected the queens whose colonies gave me the best results in HONEY, for my queen and drone mothers.

Yard No. 1 consists of a combination of the Root Long-Tongued Clover Stock, the Superior Stock so much Advertised by Hutchinson, and a Selection of My Own Stock that I have been Breeding for years, in regard to which I have the following:

Buffalo, N. Y., Aug. 31, 1901.

My Dear Victor:—Queen and nucleus arrived safely yesterday; made entrance to nucleus and allowed them to fly yesterday. Transferred them to a Dovetailed hive this morning, *without smoke, and handled them, patting them on the back, and I never saw such quiet and docile bees.* If their working qualities are as superior as their handling, I am prepared to say you have the best bees I have ever met with, which would include some 25 or 30 different breeders, and all the well-known races.

Yours very truly,

OREL L. HERSHISER.

The colony of one of the queens I have selected for a breeder in this yard gathered right about 400 pounds of honey last season. I have not measured her bees' tongues, but they are ALL RIGHT, LONG OR SHORT.

Yard No. 2 consists of imported Italians, daughters and granddaughters. For further description see ad. later. Testimonials on application.

Yard No. 3—GOLDEN BEAUTIES or 5-banded Italians.

I am now booking orders for spring delivery; first come first served.

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

ROOT'S GOODS AT ROOT'S PRICES, plus carload rate freight..

W. O. VICTOR, Queen Specialist, Wharton, Wharton Co., Texas.

California.

The State that produces carloads of honey; the largest averages of any State in the Union; a mammoth honey association to market the crop; the value of different fields, is told in the

Pacific Bee Journal,
Los Angeles, Calif.,

whose correspondents are successful producers of tons and tons—20 to 80 tons each.

California as a Honey State, by A. J. Cook. Gallup's Bee-keeping Experiences. Nevada Forging Ahead. Utah Bee-keeping. Washington, Oregon, Idaho, and Arizona News. Bee-keepers say the Pacific is one of the best \$1.00 bee-papers, prettily gotten up and illustrated; most appropriate cover design.

Clubbed with GLEANINGS, new or renewal, \$1.00 a year. Grand club with GLEANINGS and Rocky Mountain Bee Journal, \$1.25 a year.

The Pacific Bee Journal, Los Angeles, Calif.
237 East Fourth Street.

"Colorado's Characteristics; the Advantages of Irrigation; and how Western Bee-keeping Differs from that of the East," is the title of a six-page editorial in the Jan. issue of the Bee-keepers' Review.

The editor spent nearly two weeks, last November, with his camera, among the bee-keepers of Colorado; and this "write-up" is the result. It is illustrated by several pictures taken by the editor, showing the mountains, alfalfa fields, "ricks" of alfalfa hay, herds of cattle, apiaries, hives, etc. Mr. M. A. Gill, who, last year, managed 700 colonies in Colorado, producing two carloads of comb honey, begins a series of articles in this issue. His first article is on "Hive-covers," and is the best of anything that has yet appeared on that subject.

Send ten cents for this issue, and with it will be sent two other late but different issues. A coupon will be sent entitling the holder to the Review one year for only 90 cts.

With these copies of the Review will be sent an offer whereby 12 back numbers of the Review may be secured *entirely free*; and the first few who accept this offer will get, as those 12 back numbers, the volume for 1901 complete.

W. Z. HUTCHINSON, Flint, Mich.

Your attention is called to advertisement of Sure Hatch incubator on page 119 of this issue.

Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

GLEANINGS IN **BEE CULTURE** A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS. ILLUSTRATED SEMI-MONTHLY Published by THE A. P. ROOT CO. \$1.00 PER YEAR MEDINA, OHIO.

VOL. XXX.

FEB. 1, 1902.

No. 3.

LET ME SAY to J. M. Mack that his plan of emptying sections to use the next year is all right *provided* he lets the bees dry them out before the honey in them granulates. I wouldn't be willing to use them if the bees did not clean them out in the fall.

I ADVISE Bro. Aikin not to be big-headed because he devises some useful thing. All the same, if I had gotten up that separator on p. 50, I'm afraid I'd need a hat of larger size. It should be put on the list of beekeepers' supplies. Bro. Aikin, can't you give it a name not already in use for another bee-keeping implement?

MR. EDITOR, I think you misunderstand Wm. Craig, p. 61. He means his bees fly out *while* he is carrying them out. Friend Craig, the trouble is a lack of that fresh air in the cellar that the editor thinks so much of. Open up your cellar the evening before, and let it stay wide open all night, and see if it doesn't quiet the bees so they'll not want to fly out till after they are on the stand. If any are inclined to fly out, give them a little smoke. No harm if the cellar is full of smoke so long as all the bees will be taken out within a few hours.

"EXTRACTED honey can be improved by boiling it," p. 63. Do you mean boiling or heating, Mr. Editor? [I mean *boiling* in the case under consideration; for you will remember that our correspondent stated that he had some honey that soured, and he wished to know how to treat it. Mere heat, while it might do some good, would not bring about the improvement sought. It should be kept boiling for some time. That will arrest further fermentation, and at the same time expel the gases. But not all sour honey can be made sweet, by considerable, by such treatment. If very sour, it had better be converted into vinegar. If honey is slightly tainted with an acid taste, it can generally be improved.—ED.]

"WE HAVE KNOWN that the depths of the cell varied . . . the cells at the start are longer than is necessary," says ye editor, page 48. Worker comb 25 years old will be perhaps $\frac{1}{8}$ inch thicker than when new; but is there any real difference in the depth of the cell? Is not the difference almost if not entirely in the septum? Reidenbach's measurements seem to show that the average contents of a cell does not decrease with age; why should its depth? [Your notion of the matter is the same as mine. An old comb is deeper than a new one by just the thickness of the accumulations in the bottom of the cell.—ED.]

A. MAUJEAN spaces his extracting-combs $1\frac{3}{4}$ inches from center to center, leaves them on till sealed, then cuts them down to one inch in thickness. He thinks the extra yield of wax costs him nothing.—*Rev. Eccler.* [This is a very common practice throughout the West; and extracting-frames are spaced wide, even with Hoffman end-bars. Wax always brings a good price, and very many, perhaps a majority, of the extracted-honey producers, consider that there is more money in producing wax and honey both by using thick extracting-combs, and slicing down each time, than spacing the combs regulation thickness and merely cutting off the cappings.—ED.]

"THERE ARE more bees kept to-day in the old-fashioned box hive than any other style," says L. E. Kerr, in *American Bee-Keeper*. I wonder if that can be true. There are probably more box hives across the water than in this country, and it may be true there, but I suspect that frame hives have the upper hand in this country. [The statement of Mr. Kerr, even if it applied to the whole world, can hardly be true. In Europe there may be more colonies in straw skeps and box hives *combined* than in movable-frame hives. But if the statement is limited to the United States, it is certainly wide of the mark. I presume I have traveled through nearly all the best bee country in the United States and Canada; and the box hive, even with the old-fashioned farmer, is the exception. In my

last 6000-mile trip I do not think I saw a single one; but I did see all kinds of dilapidated *movable-frame* hives.—ED.]

IN GLEANINGS for July 1, 1900, in a footnote to an article of mine, you say, Mr. Editor, "We have heretofore assumed that larvæ just hatched, or larvæ not more than three days old, was the preferred age; but here is a case where the bees evidently had a preference for the five-day limit." The fact that this continues to be quoted in foreign journals, and that it is likely to be misunderstood, makes me now refer to it. While you may have meant all right, there is danger that you may be understood as meaning: "In this case the bees preferred larvæ five days old to any thing younger." This is not true. The only possible *preference* at all in that line would be expressed thus: "The bees preferred to wait till some of the larvæ were too old for good queens, rather than to start all cells earlier." Now let me give the truth deduced from my investigations—the truth that I think any one will deduce from any fair investigations—it is this: Bees will not start queen-cells with larvæ as old as three days when younger larvæ are present; but they will continue to start queen-cells after all the larvæ present have become too old for that purpose. Will my good friend of the *Review* say whether he believes this to be the truth? [I accept your amended correction.—ED.]

THE EDITOR seems to have mounted the hobby of lots of fresh air for bees in winter. I have been riding it myself for some years. Sometimes toward spring the temperature is 50° in the cellar and the bees quite noisy. Cellar too warm? No, that's not the trouble. It's 50° outside as well, and so there is no change of air. I'll start a fire and make it still warmer, so the air will change, and when the fire dies down it will be as warm as ever, 50°; but they will be quiet, because they have fresh air. [Yes, I now recall that you have been an advocate of fresh air in bee-cellars, but I had forgotten it. If I understand you, you agree with me that the temperature is not nearly so important as fresh supplies of air given often. Last winter there was a great range of temperature in our bee-cellar, ranging from 35 to 65, and yet we had perfect wintering, because the bees had fresh air all the time. I am beginning to feel that the bee-keeping world has been laying too much stress on temperature, and not enough on ventilation. For example, we kept our bee-room closed two nights; but the bees began to roar and fly out. Then we let in fresh air, and, presto! all was quiet.—ED.]

REPLYING to your question, page 48, Mr. Editor, I freely admit, and have always admitted, that a colony with short tongues may gather more than one with long tongues. That does not militate in the least with the fact that length of tongue reach is absolutely essential to get the red-

clover nectar. Now let me suppose a case. Suppose 100 acres of red clover with tubes of such depth that a tongue reach of less than .19 will fail to get the least taste of nectar. Of what avail will be all the best qualities in the world, if the bees have not the necessary .19? Another question will you please answer: Can bees do any thing on red clover without sufficient tongue reach? If they can not, is not tongue reach an essential? [Your supposable case is hardly in the realm of probability. Assuming that it is, however, you are strictly right. So far as my experience and observation go, all Italians, and possibly some blacks, will gather some honey from red clover providing there are other bees that gather large amounts from the same source. From measurements I have made, there are a good many flower-tubes in a head that are much less than the shortest tongue reach of any bees. Again, there are some seasons when nectar is secreted so freely that even a long tube will be so full that the bees can get a considerable amount before it is beyond their reach.—ED.]

I WILL TRY to answer your questions, p. 48, Mr. Editor. In the first place it should be understood that grammars and dictionaries do not make rules and definitions. The usage of the best speakers and writers alone decides what is right and wrong, and dictionaries and grammars are authority only so far as they tell what that usage is. When that usage changes, then the books must change if they would hold their places as authority. A grammar does not make right usage—it merely records it. You ask, "How can a word be grammatical when it violates all present rules of grammar?" When all the best speakers and writers unite in a usage entirely different from that laid down in the grammar, then the grammar to that extent has become antiquated and must be changed. I think that also answers your question as to how a word can be grammatical now that was not grammatical in the past. Compare the oldest English grammar published and see if it agrees with the latest. [Say, doctor, you are irrepressible. I thought I had you squelched; but even if you have the better of the argument I'll not admit it to you. No, sir, I'll say "shook" when, according to my notion, it expresses better the Dutch method of treating a swarm to the average reader.—ED.]

WE'RE BAD, but we're not as bad as somebody else. In 1900 the drink consumption in the United States per capita was 14.7 gallons; in Germany, 30.9; in Great Britain, 33.2; in France, 33.6. [I have faith to believe that, in the very near future, these figures in all of the countries will be reduced. Germany, the country that has been quoted as favoring beer for its people, is now waking up to its sense of danger. The iron Bismarck, before he died, said that Germany had more to fear from beer than from any other enemy; and the

young emperor is taking some decided steps to cut down its consumption. Verily the world is moving, because it can not be and shall not be that it grows worse. There never was a time when there was so much healthy public sentiment against the drink-evil as now. Some day this sentiment will crystallize into one unit of force, and the American saloon in our own borders will be made to step down and out. There is power enough in the churches to enable the people of the country to do it now. The trouble is, the enemies of the saloon are not agreed as to the best method of killing it, while the *friends* of the saloon are putting up a united front. When we temperance people can stop criticising each other and can concentrate our forces into one united effort we shall accomplish something, and that time is rapidly coming in this country.—ED.]

We think more kindly of the flowers
And the things that summer brings,
After facing winter's tempests
And old Zero's frosty stings.

AMERICAN BEE JOURNAL.

"Buckwheat Cakes and Honey." Words by Eugene Secor, music by G. W. York. Send Pickings a copy, Mr. Editor. I hope those cakes will not be flat; and I hope the *do* will not be sticky. Such cakes are the *staff* of life in a *measure*, at least on a small *scale*. Can't you send us *tenor* a dozen?

Some two weeks ago the Chicago Beekeepers' Association, of which Mr. G. W. York is President, made out a brief statement in regard to the canards relative to manufactured comb honey. This statement was very brief, and was signed by Dr. C. C. Miller and Camille P. Dadant as well as by the President. A copy of it was presented to the editor of the *Chicago Tribune*, the worst offender in circulating this absurd story. It was returned with the following gratifying intelligence:

The editor of the *Tribune* regrets that he can not make use of the manuscript, which is respectfully returned herewith. This does not mean necessarily that the article is not meritorious, as, on account of the large number of manuscripts received, it is not possible to print all.

Mr. York makes a center shot in his reply to this expressed determination to do a great wrong and persist in it:

But little comment on this is necessary. The *Tribune* thus admits that it had room to publish lies about honey, but it has not the space to allow the truth to appear about it! We hope those of our readers who are so unfortunate as to read the *Tribune* will let its editor know what they think of its way of doing things. It has plenty of space for liquor-dealers' advertisements, sporting stuff, etc., but declines to cor-

rect its own statements that are of untold damage to an honest industry.

Doubtless this expresses the feelings of all parties concerned. Whether this strong language will pierce the skin of these editorial pachyderms remains to be seen.

In refreshing contrast to all this is the conduct of the *Chicago News*. The statement that was refused a place in the *Tribune* was printed in the *News* in full, with large screamer headings, as we learn by Mr. York's paper of the 23. He says:

When it is known that the *Chicago Daily News* has an evening circulation of about 300,000, it will be seen what a wide reading the report will have. Up to the time of this writing, no other daily paper in Chicago has published the report, though all the morning papers were furnished a copy of it by us in person.

The complete refutation of the slander will now probably be an easy matter, as so many editors have come to see the light; but, like a suppressed fire, it will stand watching lest it break out again in a few months. King Error wields a strong scepter over the minds of men to-day.

BRITISH BEE JOURNAL.

"The Biology of the Honey-bee: its Development During the Nineteenth Century," is the title of two articles that appeared in our London exchange last November, from the pen of that able writer Mr. R. Hamlyn-Harris. They now appear in the form of a little tract of four pages. It would be hard to find more of interest in so little space.

The writer gives a brief history of bee-keeping down to the present time. He says the Dickel theory has been shown to be erroneous and incorrect, but lays great stress on the Dzierzon theory. Concerning the introduction of the movable-frame system, the author says:

Dzierzon, by his careful observations and practical ideas, which ultimately found outlet in the introduction in his apiary of the movable-frame hive, brought about a vast improvement on the old skeps of his day.

There can also be no doubt that long before Dzierzon's time hives of somewhat similar construction were used by single individuals, as is shown in the history of the ancients.

Della Rocca's book, "Traites Complets sur les Abeilles" (dated 1790), which appeared in Paris, shows that the movable-frame hive was not unknown to him, and the conclusion has been arrived at—consequent upon Della Rocca's work—that the discoverers of the movable frame were the Greeks, but that Della Rocca was the first to utilize the same in a wooden hive fitted up for the purpose. The Napoleonic and other wars of the period were, no doubt, instrumental in causing this work to be almost entirely forgotten for the time being, so that we owe to Dzierzon the fact that during his life, and on his initiative, the movable frame hive should have come into general use.

Mr. Harris does not claim that Dzierzon invented the movable frame, but his bias, if not lamentable prejudice, prevents him, as the reader will see, from making any mention of Mr. Langstroth. We are informed on good authority that movable frames "ultimately found outlet" into Mr. Dzierzon's apiary only when their general acceptance rendered his further opposition to them ridiculous. To give Mr. Dzierzon any praise for the introduction of movable frames, and yet omit any mention of Mr. Langstroth's name, is strange indeed. The world's ver-

dict is quite the other way, and will probably never be reversed.

The remarks of the author on the progress of anatomy and biology since 1840 are interesting in the extreme, showing that nearly all that is worth knowing on these vital subjects has been learned during the very short period of human existence comprised within sixty years. We owe the writer more than a passing "vote of thanks" for this little essay, for it is one of great merit.

GUARDING AGAINST STARVATION.

"Good morning, Mr. Doolittle. I have come almost half way across the continent (by letter) to have a little talk with you regarding the best way to guard against bees starving before feeding can be done in the spring. I have fears that my bees have not honey enough to carry them through till warm weather comes."

"Really, what you wish to know, then, is the best way to guard against bees starving in winter."

"Yes, that is right."

"Then I am inclined to answer, the *best* way is to *know* that each colony has sufficient stores in the fall to last till the flowers bloom in the spring; and if we know this we need have no fears as to their safety along this line."

"How much stores should each colony have on the 15th day of October, so that I might know that there is no danger of starvation before the flowers bloom in the spring?"

"When I first began bee-keeping I found one writer saying that 35 pounds was the needed amount, while another gave 25 pounds as right for a colony where wintered on the summer stand, and 20 pounds for those colonies which were to be wintered in the cellar during four or five months of the coldest weather."

"But suppose they do not have 25 pounds in their hive October 1st to 15th; what is to be done?"

"Each colony should be fed enough to make up that amount, and it will be much better to do the feeding the fore part of October than later."

"What should I feed?"

"In feeding for winter stores I find the following formula the best of any: Pour 15 lbs. of water into a suitable-sized vessel, and set it over the fire till it boils. Then stir in 30 pounds of granulated sugar, stirring so it will not settle to the bottom and burn. As soon as the whole boils, set it off the fire and stir in 5 lbs. of extracted honey. This makes 50 lbs. of good feed for wintering."

"But suppose some colonies have more stores of honey than they need, and others not enough—what then?"

"If you have movable-frame hives the matter is very simple—just exchange frames, taking full frames from the heavy colonies and giving them lighter frames from those not having sufficient, till all colonies have the desired amount, when, if any are still lacking, they can be fed with the sugar syrup, as spoken of before."

"But the question I really asked was not from the time the flowers ceased blossoming in the fall till they commenced again in the spring, but till feeding can be done in the spring. How much would be needed in that case?"

"This is something different, and something not often spoken about, yet it is something well worth knowing; for I claim that, if there is any time when it is profitable to feed colonies to keep them from starving, it is in the spring of the year."

"Why?"

"Because if we let them die now we lose all they have consumed thus far; and, besides, feeding in the spring tends toward bringing the colony in the very best possible shape to give a good yield of honey during the honey harvest."

"Do you think, then, it would be better to reserve feeding till spring, for this purpose?"

"I would hardly wish to say that, for I think October is the month to know that all have honey enough to carry them through till flowers bloom in the spring. However, there are some good apiarists who advocate this, believing it to their advantage to reserve the feeding necessary to be done to give sufficient stores during April and May, till April and May arrive, providing we can know that no colony will starve before that time."

"Did you ever work on that plan?"

"Yes. One fall I found my colonies averaging quite light in stores; and as I was short of money to buy sugar with I allowed only 18 lbs. to each colony designed to be wintered on its summer stand; and from 12 to 14 lbs. for those to be placed in the cellar, and found, by equalizing the stores in all, that I did not have to feed that fall. These were fed in the spring with a cheaper grade of sugar than could be used for fall feeding, and they built up and did well; but on the whole I prefer to feed in the fall all that is necessary to last till apple-bloom."

"But suppose the colonies have been neglected in the fall so that I do not know just how many pounds each colony has; or this has come about through sickness in the family, how am I to guard against starvation in such a case?"

"On some mild day when it thaws a little, without the sun shining (you can see best on a cloudy day), go over the colonies which are out by removing what you have over the cloth covering to the frames, and then gently roll this covering up till you

come to the cluster of bees, when you can carefully note the amount of sealed honey not covered with bees. If you find plenty of sealed honey along the top-bars to the frames, you can set that colony down as having enough till April. If plenty in half of the combs, then it is probably good till March. If very little, then it should be looked after in two weeks; and if none at all, it should be fed at once. All not needing feeding at once should be left with the hope that a day warm enough for the bees to fly may occur, when all needing attention should be looked after; but should no such day occur, then they should be attended to before they starve, no matter what the weather."

"Well, how shall I feed at this time of the year?"

"My way has been to take frames of honey from those in which I see much sealed honey, and give to those about to starve, taking out the outside combs of honey on any day when I could best do so, and putting dummies in their places. I now place these combs in a warm room for four or five hours till they get thoroughly warmed through, when I go to the destitute colony, take out one or two empty combs on the outside, divide frames near the center of the cluster of bees, using smoke to keep them from flying, and set in the warmed combs. In this way any apiary which had enough stores on an average, so that each colony could have had 12 lbs., had the stores been equalized in the fall, can be brought through till we can feed in the spring."

"Suppose the colonies are in the cellar."

"The same plan can be used there with all colonies where the combs can be gotten at; otherwise they will have to take their chances. But colonies in the cellar will generally go till they are set out, should they have as much as 6 lbs. in the hive when they were set in."

"How about feeding in the spring?"

"This can be done with feeders in the regulation manner, as given in the books; but feeding with any thing but combs of sealed honey during the winter months has been very unsatisfactory to me."

NOTES FROM A HONEY-MAN.

Thick Top-bars Preferred; Selling Honey; a Joke on Hershiser.

BY S. A. NIVER.

Mr. Editor:—Every little while some item in GLEANINGS will almost persuade me to get out the old quill and take a hand in the fracas; but my almost insurmountable mod-

esty makes it easier for you by keeping me silent. Just what makes me bristle up this time is that thick or thin top-bar controversy between Pettit and Dr. Strawcutter, for it's many a weary hour did I work at the sticky job of exchanging $\frac{3}{8}$ pine worm-eaten top-bars for $\frac{3}{8}$ basswood ones. Please read that last part over again, and read it slowly, for it sums up Morton's conclusions after many years of experimenting. You may remember that Morton always had enamel cloth over his frames or supers in summer, and worms (apologies to Prof. Cook) would get on top of the pine top-bar, and bore or eat holes enough there to weaken it so it would sag more than it naturally would, on account of being too thin; but they never trouble basswood.

I am keeping at the canvassing from house to house with extracted honey, and have handled 8750 pounds this season, and was put out of commission by the grip for four weeks besides. There are many vexatious little points to settle before the system will work all smoothly; but every one met and conquered makes it easier. One little incident I want to tell you about, for it makes me feel real *toney*.

I am in the habit of going over my territory about once a month, and so in the course of my rounds I called on a customer who had a dollar's worth the first trip. A chap of twenty years or thereabout answered the door-bell, and, to my inquiry if the lady of the house was in, replied, "*No, she is out.*" Then I explained the case, and asked if that first lot of *honey* was gone yet, and if they wanted more.

Say, Ernest, you would have enjoyed seeing the smiles thaw out the frost on that young chap's face. He swung the door open wide enough to let in a pair of honey agents, and said, with a hearty ring to his voice, "Oh! you are the honey-man. Come right in. I'll call mother—she is in the parlor. I thought you were a *book agent*."

"There! don't we feel less of that tired feeling, and step a bit loftier, when stray straws like that show how the public begins to recognize our true worth?"

In another house I was told a good yarn on Hershiser, the jolly superintendent of the York State honey exhibit at the Pan-American. The lady had been persuaded to buy a jar of extracted honey there in the booth, "And," said she, "what do you think it was? Why, nothing but sugar syrup flavored with cinnamon essence."

Who would have "thunk it" of Hershiser—our ferociously virtuous Hershiser? But all my assurances of his honesty were of no avail with that lady.

The grocers here are selling tumblers of a clear yellowish liquid labeled *Pure Honey*, which has a sticky effect to the tongue, and a decided flavor and aroma of cinnamon. If they will only keep right on handling such stock, leaving the honey trade to me, they will never hear a word of protest from me.

Niagara Falls, N. Y.

THE long-looked-for rains in California have come, at least in many localities. If this continues it will mean another good year for our friends on our western borders.

IN referring recently to the use of sulphuric acid in refining wax I stated that the acid and water, after standing, would separate. Two or three have written, saying that I must be in error, as the two would unite and stay united. I have not had an opportunity to test the matter; but my informants are evidently persons who understand what they are talking about, and I therefore accept the correction with thanks.

THE NEWLY ELECTED OFFICERS OF THE NATIONAL BEE-KEEPERS' ASSOCIATION.

THE following is the report of the special committee appointed to receive and count the ballots:

We, the undersigned, have this day counted the ballots cast for General Manager and three Directors of the National Bee-keepers' Association, to fill the vacancies caused by the expiration of the terms of Eugene Secor as General Manager, and J. M. Hamblough, Dr. C. C. Miller, and C. P. Dadant as Directors, and find that 338 ballots have been cast, of which Eugene Secor received 172. The other ballots were cast for 109 different members, the largest number of votes for any one of them being 29.

For Directors, J. M. Hamblough received 180 votes; Dr. C. C. Miller, 232; C. P. Dadant, 215. We have also counted the votes cast for and against the proposed amendments to the constitution, and find that 214 were cast for the first amendment, and 93 against it; 263 votes were cast for the second amendment, and 47 against it.

A. B. MASON,
S. J. GRIGGS.

Toledo, O., Jan. 27.

Com.

The General Manager, it seems, was re-elected in spite of his expressed wish not to serve again. This surely bespeaks confidence, and an indorsement of the policies pursued under the several terms of his administration.

THE RAMBLER FINDING HIS "FOUNTAIN OF ETERNAL YOUTH" IN CUBA.

A SHORT time ago, in a private letter to John H. Martin (Rambler), now in Cuba, I gave some fatherly (?) advice to the effect that he should remember that he was no longer a young man, and that he should go easy on his strength, and, above all, not to get too enthusiastic over a bee company. This is the way he comes back at me:

Bless me! Did you think I was hankering after running a big bee and honey company? Not much. I am merely blazing the way for younger men. And let me tell you, Bro. Ernest, I am about ten years younger here than I was in California. Don't you throw out that I am too old for any thing. Why, I laid out that big robust Somerford the other day on a rough wheel-trip. I haven't had such a good appetite and digestion for years as I now have. I haven't decided yet what I shall do or how long I shall stay. Cogshall will be here soon, and several of us are planning a trip to the Isle of Pines. I may buy me a little farm over there.

But I have another bee in my bonnet. I am getting photos of almost every thing in sight, and shall have lots of lantern-slides. How about a grand lantern lecture-tour of the States—lectures on California, Cuba, and on bee culture? I am wondering if you will say. "You are no longer a young man."

Let me see. Our young friend is only 62, or 23 years older than his paternal (?) adviser. A little later on I'll show you how this youthful cyclist can "scorch" (for I caught him in the act), even if he is a regular down-east Yankee. Some call him "Long John." Well, that is just what he is. When I saw him in California he hadn't an ounce of flesh to spare; and here he is out-doing that big Somerford on a bicycle, and now he proposes to tour all over the United States. Come on, John; we will give you a welcoming hand all over the States—I mean we bee-keepers.

I suppose he will tell us something about the Isle of Pines—one of Uncle Sam's recent possessions.

THE PROGRESS WE ARE MAKING FIGHTING THESE COMB-HONEY LIES.

WE are making some progress in counteracting the effect of the comb-honey slanders that have been going the rounds of the press. Certain familiar items have ceased to appear. But don't let us lay down the gauntlet yet; an awful damage has been done to the comb-honey trade because *there are millions of people who still believe comb honey is manufactured, and therefore will not buy our product.*

It is no little pleasure to know that two or three of the great dailies of the country have published the truth about comb honey; but somehow that truth does not seem to get into circulation through *other* papers that have scattered these lies as on the wings of the wind. All honor to the *Chicago Daily News* and *Chicago Chronicle* for publishing the truth about comb honey in displayed head lines. But the *Chicago Tribune*, the paper that took up the defamation of the comb-honey business in the first place, and started this onset of lies, has not retracted, and our readers are requested to keep up their fusillade of letters. Let them feel the *force* and *might* of numbers.

Among the farm papers, there have been quite a number that have published retractions. One or two held out long and hard. Among them was the *Farmers' Guide*, of Huntington, Ind.; but now it has come out with a bright breezy backdown that is truly refreshing; and to illustrate the power that bee-keepers can exert by sending in hundreds of letters, I publish the first paragraph, or a part of it at least, of the last statement that that paper has made:

The unity with which bee keepers guard their interests is one of the most commendable things that has lately come under our observation. If the farmers would take care of their interests as well, no combination could affect them. Not long ago we published an item to the effect that artificial comb honey was being manufactured by machinery, and that glucose and paraffine were used. This brought us denials from all

quarters of this country. These letters were courteous, acrimonious, and blasphemous. They were warm, hot, and red-hot. They were reasonable, sensible, and senseless. It seemed that every bee-keeper in America had "swarmed," and all were being pursued with the dust and noise of a cyclone. They acted as though *The Farmer's Guide* had a most powerful influence to the detriment of bees and honey, and if a well-filled waste-basket could stop the paper or turn the editor into the right channel they would contribute to the basket's fullness. Poor basket! Imagine what it must bear!

Just read that over once more, brother bee-keepers, and then follow up some of the other papers that have not yet published retractions. It seems that the editor of the *Farmer's Guide* finally appealed to the Department of Agriculture, and in reply received a very strong letter from Professor Frank Benton, Apicultural Investigator. It is needless to say that our friend "at court" furnished indisputable proof that comb honey could not be manufactured.

I do not like to keep on *ad nauseam*, urging bee-keepers to write, write, write, to these offending editors; but that is the *only* way we can counteract the evil effects that have been already suffered. Let me now urge that every one of our subscribers send in a short item to his local paper, telling the truth about comb honey, and denying the stories that have been afloat, and see that it finds its way into print. It does not matter whether the paper has published anything against the business or not. C. B. Howard, Secretary of the New York State Association of Bee-keepers' Societies, has written a splendid article setting forth the truth about comb honey, in the *Farm, Field, and Fireside*, a paper of an immense circulation and influence. That's right, keep it up. Let us get the truth prominently before the consumers in such a way they will begin to believe the truth that the comb honey they see in the groceries *is not bogus*.

We have already assurance that another farm paper with a circulation of two millions is going to publish an item denying the usual comb-honey lie, and telling the truth. As soon as the item is published we shall place it before our readers.

Regarding the paper against which our attorney began proceedings, I can only state that its editor has promised to make a satisfactory retraction. Our attorney made a trip of a thousand miles to begin his action; but before doing so I think he convinced the editor in question that he "had put his foot in it pretty deep."

OREL L. HERSHISER.

DURING the closing days of last year, Mr. O. L. Hershiser, of Buffalo, Vice-president of the National Bee-keepers' Association, and Superintendent of the apicultural exhibits at the Pan-American Exposition, paid us a visit at the Home of the Honeybees. My first acquaintance with him was at the Michigan Agricultural College, in the summer of 1883, where I had called to see Prof. Cook, the Professor of Zoology and Entomology, and director of the model

experiment apiary of the institution. Prof. Cook being absent at the time, Mr. Hershiser, a student of the college, who was making a special study of apiculture, extended to me the various courtesies of the place. Again, in 1884, I met him at the home of Mr. D. A. Jones, of Beeton, Canada. He, like myself, had come to pay the most distinguished bee-keeper of all the Dominion a visit; for if Mr. H. was any thing he was a bee-keeper through and through. It was his policy, and has been ever since, to learn all he could about bees; and with that end in view he always went to the fountain-heads for information.

OREL L. HERSHISER.

Since that time I have met him at various conventions of bee-keepers; and so interested is he in the subject of apiculture, that, if there is any national or State convention within 500 miles of him, he is pretty sure to be present. He was chosen Vice-president of the North American Bee-keepers' Association in 1893.

Last year he was called in as expert witness at the Utter trial, Goshen, N. Y.; and at the last Buffalo National Convention he was again elected Vice-president. He has been recognized by the State of New York as one of its leading bee-keepers, and his services have been sought on numerous occasions to superintend aparian exhibits—first at the Buffalo International Fair, in 1889, and the Detroit International Fair the same year. He was superintendent of the

New York apiarian exhibit at the Columbian Exposition, in 1893; and again he was chosen for the same service at the Pan-American, Buffalo. At the latter exposition he installed and conducted, as a part of the New York State apiarian exhibit, a model practical apiary of ten colonies, partitioning off a large window in the Agricultural Building for the purpose, and gave frequent exhibitions of the various manipulations of daily occurrence to the apiarist; and his skill, and the success of this novel exhibit, was evidenced by the practical results of 481 pounds of extracted and 523 one-pound sections of comb honey, besides an abundance of honey left in each hive for winter stores, one colony of *black* bees actually producing, under these unfavorable circumstances, 111 fancy 4×5 sections of comb and 30 pounds, or over, of extracted honey. Mr. Hershiser was awarded the gold medal for this exhibit of a model apiary.

Not only an ardent enthusiast on bees, Mr. Hershiser is a practical and successful bee-keeper. He has two large apiaries on the outskirts of the city, and he has made them, in spite of his law business, pay and pay well.

By profession Mr. Hershiser is a lawyer, and for some years he has had a law office in one of the sky-scrapers in Buffalo; but his intense love for the bees seems to draw him, in spite of himself, into the honey business, with which he has been so intimately connected for so many years.

Born in 1856, in Shelby, O., he removed with his parents to Williams Co., in the same State, at the age of six, where he studied in the common schools; worked his way through the Michigan Agricultural College, from which he was graduated in 1884 with the degree of "B. S." He was admitted to the bar in 1891, and has practiced law ever since. From the *Albany Law Journal*, a paper that contains a biography of him, I extract the following:

The story of Mr. Hershiser's early life is similar to that of so many of the sterling men who have shaped and molded their own fortunes and attained to positions of honor and eminence in the city, state, and nation, and who represent the highest standard of American citizenship. He is a self-made man in the truest and best sense of the term. When he was six years old his parents removed to Northwestern Ohio—a region at that time but recently opened up to settlement where they began to hew and form a home out of the wilderness. Thus at an early age the subject of this sketch became acquainted with the labor of reclaiming a farm from the primeval forest, and some of the varied and not altogether poetical experiences and incidents of pioneer life. His early education was obtained at the country district school during the brief winter terms, supplemented by a limited course in the academic department of the village school. Laboring on a Michigan farm, he earned and saved sufficient means to enter upon a college course at the Michigan Agricultural College at Lansing, where, by teaching school or engaging in other employment during vacations, and by the practice of rigid economy, he was able to prosecute his studies to graduation. The same resolute purpose, independence of character, and fidelity to duty have marked his career to the present time.

His early associations instilled in him a love for rural life and pursuits, and the natural sciences pertaining thereto. Economic entomology, with especial reference to apiculture, has become his chief recreation

for the time he can spare from his legal business, and his keen preception and close observation have made him an expert and acknowledged authority on the life and habit of bees and apiculture generally. This fact has been repeatedly recognized. On several occasions, while yet a student, his services were sought to formulate and superintend apiarian exhibits for several large expositions in this and other States.

On the 6th of December, 1899, Mr. Hershiser was united in marriage to Miss Margaret Jane McIntosh, of Toronto, who was born of Highland Scotch parentage at Lucknow, Ontario, Canada, Oct. 4, 1874.

A MODEL BEE-CELLAR.

Some Suggestions on Wintering.

BY HUGO KOEHLER.

Mr. Root:—I was interested in your article about wintering bees in a large cellar, on page 683. Probably it will be of interest to your readers to hear of our experience in wintering bees in cellars.

For the last ten years we have wintered from 150 to 200 colonies in two cellars constructed for that purpose. I have attempted to give you a longitudinal section of one of them. The inside dimensions are 14×10×9 feet. In the figure, *a* represents the walls of the cellar, made of cedar logs hewed on two sides. The cracks between the logs are smeared out with lime; *b*, ceiling of two-

inch plank; *c*, a layer of cement, 2 in. thick, on the ceiling; *d*, a layer of clay mixed with sawdust. The layer is about a foot thick; *e*, ventilator chimney 12 inches in diameter and 8 ft. high over the roof; *g*, a shutter or damper to control ventilation and temperature; *h*, valve through which a thermometer is passed; *i*, string on which the thermometer is suspended; *f*, ventilator canal 4×4 in. on the inside, and 30 ft. long, the outer end of which can be closed at pleasure; *j*, peak of roof; *k*, gables; the rear gable has a door; *l*, roof of a portico; the portico is

about 8 ft. long; *m*, ground-line; *n*, door to cellar.

Having described the cellars, now for our method of wintering.

First we try to have all strong colonies to put in the cellar, so if, in fall, we have weak ones we double up.

Second, we give them healthy food, mostly sugar syrup.

A week before putting the bees into the cellar we thoroughly disinfect them by burning about 2 lbs. of sulphur in each. As soon as the sulphur is fairly burning, the cellars are closed tight and left that way for 24 hours, when every thing is opened to give them a thorough airing.

The bees are put into the cellars the last half of November. On the morning when we wish to place them in, all entrances are closed with laths; then they are taken there and piled up in tiers along the two long walls, placing the lower row about a foot from the ground. When they are all stored away, the door is closed, making the cellar dark; then a man enters with a dark-lantern, and removes all laths. From now on until they are taken out we daily watch the thermometer so that it does not fall below 40° and does not rise above 45. This we can do without entering the cellar, by opening slide *h*, and pulling up the thermometer, which is suspended by a string. The temperature is regulated entirely by the ventilators. In very cold weather the portico is filled up with snow. About the 15th of February we enter the cellar for the first time, after they were put in, armed with a dark-lantern and a long wire hook to scrape out hives if there be any need. From now to the time of taking out (the first half of April) we enter twice more. We take them out on a nice warm day, first closing all entrances again.

We find this method of wintering very satisfactory. Several small bee-keepers have built themselves a cellar like these, and have wintered with more or less success.

[This cellar embodies almost the same principles as the Bingham which we have illustrated on page 933 for Dec. 1st; for it will be noted that the cellar proper is *entirely under ground*, and the upper portion is covered with a gable roof and a ventilator. Mr. Bingham finds it is necessary to have a ventilator up through the roof, about 20 inches square, and it is possible our friend Koehler might find it an advantage to enlarge his.]

I believe that the ideal wintering repository for indoor wintering of bees will be one that is wholly under ground; then when we put with this a generous supply of fresh air, we have ideal conditions. I do not entertain the popular belief that uniform temperature is so important as uniformly good air. Why, for example, do bees outdoors winter so well when the temperature ranges all the way from 70 above to 10 below? It does so here at Medina.

With this extreme variation it should be remembered that the outdoor bees always have plenty of fresh air. Now, then, if we can prevent the extremes of temperature, and get the fresh air just the same, shall we not bring about a condition much more perfect in wintering than has ever been attained before? As I have already explained, the temperature in our bee-cellar last winter where we had such good wintering ranged all the way from 35 up to 60; but the bees had fresh air—great quantities of it—all the time.—ED.]

NOTES OF TRAVEL.

Or, rather, some Observations on Irrigation or Western Farming in General.

BY E. R. ROOT.

I believe brother Root, of *Gleanings*, has prophesied that, within a few years, the great bulk of the honey crop of this country will be produced west of the Mississippi. From a week's visit in Colorado, during which I visited several apiaries, and questioned many bee-keepers regarding the apicultural characteristics of the great West, I am inclined to think that brother Root's prophecy will prove correct. This part of the country is progressing and developing at a rate of which Eastern people have but a faint conception. Those who look upon this country as the land of a burning sun, of shifting sands, coyotes, and cacti, will do well to lay aside that delusion. The explanation of this wonderful change can be given in a single word; the key that has unlocked the great agricultural wealth of the West is WATER.—W. Z. Hutchinson, *Editor of The Bee keepers' Review*.

Before going further with my line of travels among bee-keepers, it seems best, on many accounts, that I should stop just long enough to tell something about irrigation, because it is intimately and vitally connected with the honey business; and one can not very intelligently describe some of the special conditions that prevail in some of those reclaimed Western lands without telling something about how the crops are watered. I have yet one and possibly two articles relating to bee-keeping in Arizona; but as it was in that Territory that I gleaned my first information on irrigation there is no better time than now to tell about it, in order that my other articles on alfalfa may be better understood. In doing so I shall take up irrigation as it prevails, not only in Arizona but in California, Idaho, Utah, and Colorado.

Besides the information gleaned from personal observation on the ground, I am indebted for much that I shall give to Bulletin No. 73 from the United States Department of Agriculture on Irrigation in the Rocky Mountains, by J. C. Ulrich. This is one of the best if not the best short treatise on the subject I have ever read; and those who wish for further information can not do better than send to the Superintendent of Documents, Union Building, Washington, D. C., for this bulletin.

IRRIGATION FARMING IN THE WEST.

The marvelous growth of the western half of the United States is more largely due to irrigation than to any other single agency,

according to Elwood Mead. This same authority goes on to state that it required less experience to plow furrows for carrying water in some of the western arid lands during the early days of irrigation than it takes now to put out a system of underdrains to carry away the excess of water on some of the eastern farms, and I believe it. But irrigation to-day, as I shall presently explain, is much more complicated, with its system of canals, ditches, and laterals than it was at first, when each one irrigated his own little patch from some near body of water.

It was a matter of surprise to me that the knowledge of the practical farmer from the East does not avail him very much when he strikes these arid lands that have to be watered artificially. Almost any one without experience, providing he has good common sense and lots of energy, can do almost as well, because the mode of farming is so strikingly different.

SOURCES OF WATER SUPPLY.

As I have already pointed out, a large portion of the water used for irrigation comes from melting snows on the mountains. In the East, the great amount of precipitation is either in the winter or along in March and April; and the consequence is there is a greater supply of water than is required, and it of course goes to waste. In the mean time the farmer has to wait till the land is dry enough before he can work it. But in the West the greatest supply of water comes at a later period and just at a time when it is needed. When warm weather comes on the snow begins to melt; and this vast quantity of stored-up water, in snow form, is given off under the influence of the unadulterated rays of the sun about as fast as the irrigator can use it. In the mean time he has been preparing his land, fixing up his ditches, and as soon as he is ready for the water he turns it on; and he can have his moisture under absolute control, providing, of course, there are not too many ranchmen taking water from the same ditch, and providing, of course, there is an equitable distribution, which in some cases there is not. It will be seen, then, that the mountains, the very cause of these arid plains, because they form a barrier to the clouds and winds, are the means of catching the snows, preventing them from going into the valleys or upon the plains; that is to say, they are the fountain sources or *reservoirs* for holding the supplies of water that they have borrowed, so to speak, and yet later on pay back in installments.

FARMING IN THE WEST VS. FARMING IN THE EAST.

Right here arises an interesting question: If it were not for these mountains, the probabilities are these arid lands would be watered the same as our land in the humid territory. Would it be better if these great barriers did not exist? I think not, as I shall presently try to show. The farmers

of the East are continually being hampered by having too much water—that is, too much rain at *certain times* and not enough of it at others. As a result, their crops are somewhat uncertain. When they do get a large yield there is an oversupply, and prices are low; and when, by reason of drouth, there is almost no crop, prices are high, but there is nothing to sell. The trouble is not, that in the aggregate there is not enough or too much water, but an *unequal distribution* of it. In the West, the same amount of moisture in the form of snow is lodged on the sides of those great mountains. The sun is bound to shine; and the accumulated wealth (water) that has been stored up all winter can be given off, and is given off just as the farmer wants it, with the result that his crops are reasonably sure in most localities and prices generally good. But right here I may be misunderstood. There are some irrigated regions where the water supply is inadequate some seasons, either because too many ranchmen have located in a certain area, or because the fall of snow is just barely adequate, under favorable conditions, to supply the demand.* When the precipitation has been light, then there is general hardship. It is but fair to state that, owing to the lack of proper laws regulating the number of ranches to the amount of water, there are some localities that are over-farmed, if I may use the term, for the amount of water or precipitation some years, so that the irrigation farmer so located does not have things all his own way; but I think I am not overstating the facts when I say that certainly he has the advantage over his co-laborer in the humid portion of the country, because he has the one important requisite, water, much more nearly under his control.

I think I am also correct in stating that most of the localities are not overstocked, if I may borrow a term from our own industry (apiculture) with farmers. The thinning-out process is sure to come. Some will become disgusted, and move out. Lands that were sold at big prices are worth practically nothing, because it is difficult to get all the water that is needed during off years of light precipitation of snow. In my line of travels, I ran across many and many a ranch that showed the irrigation furrows all over it, but which had been abandoned, and which was then overgrown with sage brush, and occupied only by the jack-rabbit and the coyote. These furrows seem to be silent reminders of the fact that some poor fellow had been induced to go upon these lands from the over-coloring that had been given him, paid big prices, sunk his money, and abandoned his ranch, sadder but wiser.

A WARNING TO PROSPECTIVE IRRIGATORS.

Before I go further I wish especially to warn go-west young men not to be misled

* This is true in the region of Phoenix and Tempe, Arizona.

nor fooled by the extravagant claims of some railroad companies and some irrigation corporations who have land and water-rights to sell? He should go into that territory where he expects to locate, and work one season as a hired man, if he can not afford to lie around; then he should post himself right on the spot; get acquainted with men who have no ax to grind, either because they want to keep him off or because they would like to sell some land of their own that they can not irrigate successfully.

Now, having stated the facts as fairly as I know how on both sides, let us examine into some of the methods. I will first give a sample of how much of the irrigation country was developed.

THE PIONEER IRRIGATOR.

In the early days the pioneer, after having taken a claim near some mountain stream, constructs his own little ditches, irrigates his ranch, and produces good crops. When one "strikes it rich" another is anxious to do likewise; that is to say, perhaps man No. 2 locates on some stream a mile or so above or below No. 1, and in like manner the whole length of the stream, so far as the land will permit, is peopled with the early settlers. But as emigration pours in, all the lands adjacent to the mountain stream are taken up; then gradually some arrangement is made with some farmer, already having a ditch at a favorable location, to enlarge his ditch so the late comer can get water more remote from nature's supply. This process continues until these little ditches that were originally designed to take care of one farmer are so enlarged as to supply water enough for ten or twelve. But as time goes on it becomes apparent that some main ditches will have to be constructed. A stock company, made up of farmers, is then organized, something after the following plan:

A COMMUNITY IRRIGATING STOCK COMPANY.

A certain number of settlers file their claims on government land, which is plotted out, each man having certain holdings. An engineer is called into requisition to figure on the cost of irrigating the whole by means of large and small ditches. The expense, figured up, is so much. We will say in this case it is \$100,000. If there are 100 large ranchers each will take a \$1000 share; if 1000 small ones, the shares will be \$100. Some farmers can pay down the money, while others can not; but the last named have to agree to pay the amount as fast as they earn it, in crops. If they can not redeem it, the land will revert to the stock company, and all rights are forfeited.

This plan has been carried out very successfully in a great number of instances—perhaps in a majority of them, I think. Farmers not only paid out of their earnings, for their full holdings of shares, but have actually made money. They are then in position to sell their holdings, together with the water-rights, to others, or buy up

from each other. Each proportion of share brings with it a proportion of water. This is what is called community irrigation on the stock-company plan.

CORPORATION CANALS.

There are other cases where it is evident that no aggregation of farmers of limited means can afford to put up sufficient money to run great canals perhaps a hundred miles or so up into the mountains and extend them down with their laterals into the valleys below. Sometimes great flumes around the mountain-sides, or tunnels through them, have to be constructed, and nothing short of a gigantic enterprise, involving millions of money, will convey the water from a distance in sufficient quantities. To undertake enterprises on such a scale, immense corporations have been formed for the sole purpose of investment. They buy up government lands, construct enormous canals, and employ an army of workmen to divert the water this way and that, and sell land with water-rights to homeseekers. This is the plan that is in vogue in many localities; but as a rule the ranchman is at the mercy of the corporation, for it can and does charge more for the water than is paid on the community plan. I heard no little complaint of unjust charges in several localities.

GOVERNMENT AID.

In some instances, to construct these large canals State and government aid is needed to help out private enterprise; and it is very evident that, if some of the lands now perfectly arid are to be reclaimed, something more than private enterprise will have to be called in to construct some of those immense canals of size and length sufficient to carry water to the point where it is needed. There are thousands and thousands of acres in the great West that are yet to be reclaimed, or which will remain desert until State and government aid can be called in. It is with no little pleasure that I notice that Congress is now to give this matter some consideration, and it is high time that it should; for the people out west are clamoring for aid, and will have it and should have it, in my humble opinion.

METHODS OF DISTRIBUTING THE WATER ON THE LAND.

One of the first important requisites is to prepare the land in such a way that the water can, by means of little ditches or furrows, be diverted over every portion of it, for it will not do to let one spot get too much and another scarcely any. It must be *evenly* watered to get the best results. Sometimes an engineer is called in to level off the ground, for it is very difficult for the eye to detect the high and low places; but an experienced ranchman is generally able to determine these things very well for himself; and after he has once watered the land he knows where the high and low places are; and before he puts out his crop again he makes the proper leveling by mov-

ing earth from those high spots and shifting it over to the low. Where the land has a slight fall, and is nearly level in its general contour, it presents the most favorable conditions; but even land that is more or less hilly is irrigated very successfully. In fact, I saw farms that, if I did not *know* they had been watered over every inch of the surface, I should have said they could not be successfully irrigated. Yet there is a sort o' trick of the trade by which, in effect, the irrigator makes the water "run up hill" on to the high places,* and from these ridges it flows by little lateral ditches over the entire surface. If the land is too hilly, the ditches, instead of running straight down hill, run on a slant, or, as a woman would say, "on the bias." This is to prevent too great erosion. While some lands are irrigated by means of ditches or furrows, others are watered by means of diking up a plot or square of ground on its four sides, leaving its center as level as a floor. The water is now turned into this general depression until the entire surface is covered like a little lake. It is then cut off, and the water gradually soaks into the ground. But in some localities this procedure causes the ground to bake too hard, and the ditch or furrow method is preferred.

AMOUNT OF WATER REQUIRED BY EACH CROP.

Mr. Ulrich, the author of the bulletin referred to at the outset, says that no definite estimate can be given of the amount of water required for each crop, on account of the differences in locality. "Grain," he says, "requires less water than alfalfa; potatoes less than grain, and fruit-trees less than any of them. For ordinary farm products of the temperate regions, . . . two or three irrigations or applications are usually enough for the production of a satisfactory crop." It would appear, then, that alfalfa, one of the most important crops grown in all the West—if not, indeed, the most important—requires more water than any of them. It is such a rank rapid grower that it very soon converts the product of the soil and water into a strong, lusty, succulent plant. And it is this plant, as I before stated, that makes such slick fat cattle.

In the more southern portions of the United States water may be used almost all the year round. In the more northern portions, such as Colorado, Idaho, and Utah, the water is cut off, and little or none of it is used until the following spring or summer.

THE QUESTION OF PRIORITY.

This is a matter that has received considerable attention in the irrigated lands; and the same problem that confronts the bee-keeper also confronts the irrigator. A great deal of trouble and litigation has

arisen when, in some localities, water runs short. Then the question comes up, "Who has the right to the water?" I think that, in most cases, the courts have settled it that the man who was *first* in the locality, and demonstrated the value of the land, and showed that it could be successfully irrigated, should be favored. It appears that the late comers, unless they have bought some priority rights, are the ones who have to suffer when the supply is scant. So long as there is plenty, the question of priority never comes up.

MAMMOTH RESERVOIRS.

But there is a move on foot now in many localities to establish mammoth reservoirs so that at certain seasons of the year, when the snow melts faster than the irrigation land can take the water, the overplus can be run into these artificial lakes and kept there if the general supply runs short.

COST OF LANDS AND WATER-RIGHTS.

Irrigable land may be had as low as \$15; but ordinarily I suppose the price would run from \$35 to \$100 per acre; and soil that would grow citrus fruits in a climate sufficiently mild, and free from frost, is worth many times more on account of the time it takes to get the trees to bearing age. The use of the water per acre, or what is called "water-rights," varies in different localities. When it has to come from a distance, or when the supply at the source is limited, rights are correspondingly higher; but a fair average for all the water one needs per acre for one season, is somewhere about \$1.00. If one has 100 acres he pays \$100 a year for water; and this payment secures to him absolute control of the moisture in the soil. In some localities the rights are 50 cts.; in others, \$1.50. Where water has to be pumped, as in some of the citrus regions, the rates are higher still. But oranges and lemons do not require more than a tenth the amount that alfalfa does; so that the water-rights in the alfalfa regions, on account of the quantity required, would be higher. But where there is plenty of water—oceans of it, so to speak—citrus fruits can not be raised. Nature seems to have designed that, where land is adapted to the growing of alfalfa, there shall be plenty of water. On the other hand, where the climate is such that there are never any frosts, then the supply is limited. The more I have studied the topography and general conditions in the great West, the more I could not help seeing how wisely the divine mind has planned all these things for his children—yes, us children who live under the Stars and Stripes, and who are made up of nearly every nationality in the world. No matter how diverse our bringing up or notions, we are sure to find conditions in these States where every one can live and prosper.

EXPLANATION OF THE ENGRAVINGS.

From the general description I have already given, I think most of our readers

*This is done by bringing the water from a distance on higher ground; and in order to get it over to the next elevation on a lower level, it is sometimes necessary to carry it in wooden troughs elevated on standards, until the proper level of ground is found.

will understand the various cuts. Figs. 1 and 2 show the main canals, the water for which finds its source many miles away. Sometimes these canals are built on embankments raised above the level of the low ground, just about as one would see railroad embankments. On the very top of the artificial ridge a broad ditch is cut. In Fig. 1, if I mistake not, the land has been elevated somewhat to provide for this.

In Fig. 3 we have an illustration of the regulating structures that are used to control the flow in the several directions from the main canal. These smaller ditches are usually called laterals. As the supply of water may be somewhat limited, we will say lateral No. 1 will get water to-day or to-morrow, and supply the farmers all along its line. Lateral No. 2, at right angles to it, will be opened up while lateral No. 1 will be closed. In some instances there is enough water to supply two laterals at a time. But in any case the amount of water in each lateral is regulated to the number of users on that lateral. This is accomplished by means of wooden gates that are raised up and down between wooden slides. In fact, they are big wooden valves. Their exact construction does not show very distinctly; but if one will look closely he will see in Fig. 3 some wooden standards in the shape of a letter T. The one that has been raised higher than the other two is open while the other two are closed.

In Fig. 3 will be noticed examples of the cottonwood-trees that grow so luxuriantly along these canals; and delightful shady drives are often found paralleling these artificial streams of water. These same cot-

tonwoods are shown in Figs. 4 and 5, but in 4 they are of a younger growth, and are probably not much over five or six years old. In ten years more they will be great massive shade-trees with trunks from 10 to 20 inches in diameter. All through Arizona one can trace the line of the ditches clear across the country by the splendid rows of cottonwoods growing along their banks. Sometimes there is a ditch on each side of the road. In that case there is a handsome arch of shade for miles.

Fig. 4. This represents the "furrow method" of watering the ground. As I understand it, the water is allowed to run from the ditch in the foreground into each little furrow; then it is cut off by a shovel-ful of earth, and the next furrow is opened up. Clear over by the trees will be seen two men called irrigators. They are irrigating the crop on the other side of the road by opening up the furrows, as I have described. These cottonwoods are probably alongside of the main canal from which the water is diverted into these smaller ditches. One can see how very, very level the country is in some of these irrigated regions from the cuts here shown.

Fig. 5. As one goes through the irrigated regions he will run across scores of these main canals, some of them being a hundred miles or so long. Where the fall is great enough to make an erosion of the bank, small dams are run across the ditch at intervals of one or two miles. This keeps the water a still-running stream, or comparatively so, and yet keeps the ditch full so the water can overflow and run into the laterals.

SOLAR WAX-EXTRACTORS.

Their Proper Construction and Usefulness; why a Solar Wax-extractor should be Used in Connection with a Wax-press; Handling Slumgum; a Valuable Article.

BY R. C. AIKIN.

The solar wax-extractor has of late been somewhat discredited by the editor and others. I know they do not discard it altogether, but it is not receiving the credit which I think it should. In my practice I do not see how I could get along without a big solar, as it is a great source of revenue and a labor-saver.

I made my first solar about twenty years ago, soon after Mr. Boardman described his solar as made by him. I think it was in the columns of this journal that the first description appeared, though I am only guessing at it. I know it was a good many years ago. As nearly as I can remember, my first machine was about 2 feet by 3—long way north and south. Along in

boiling water, and in that cylinder I put the combs and proceeded to boil and turn, but the thing was nowhere near equal to the sack-and-stick method. I gave it up as a failure. After that I depended on the solar and the bag methods, occasionally resorting to some method of applying pressure to the slumgum after I had boiled and punched out all the wax I could get.

SOLAR WAX-EXTRACTORS VARIOUSLY CONSTRUCTED; THEIR FIELD OF USEFULNESS.

But now to the solar. I believe every apiarist should have one, and put his wax accumulations through that first. Since coming to Colorado I have built several solars—first a small one about 2×3 feet, a wooden box with a window-sash for the glass. The second one was a wood-glass structure, in size about 3×6 feet, a door at the back by which to load it, and a pit, or drop, at the front, and a side door where the wax cakes were removed, the structure on wheels and legs. This same machine was somewhat remodeled and changed to meet new ideas. Next was a brick-glass structure with a furnace under it, size about 4×6 feet. Later I built another brick one with a furnace under it. This, too, was 4×6 feet. All these machines were made the common fashion—long way north and south. The sash frames were for the most part of wood, but in a few instances I put in metal bars, some of iron and some of tin. Up to this 4×6 machine, original and rebuilding, I had built not less than half a dozen solars and put through them much wax—at least several thousand pounds.

But in all these efforts I found some serious faults. No matter how many legs and wheels, the things would not face the sun unless I was there to face about. The brick machines were, of course, stationary, but made with a view to getting the maximum of sunshine. The next effort was to enlarge the 4×6 and make it a 6×6, the glass roof having

three slopes or sides, south, east, and west. This was shown in half-tone in this journal two years ago, the editor photographing it himself. That same solar went through several evolutions in some of its parts, mainly in the internal arrangements. It was put against the south side of a 10×16 brick house, the loading being done through a door opening from the building into the solar. At one time the wax and honey were discharged to a pit in the center of the back (north) side, and the unloading was also done from the inside of the house, not an opening being outside.

Later I discarded the back central discharge and ran all to the front, the object being to get the honey and wax where they would be as long as possible in the sun.

AIKIN'S MAMMOTH SOLAR WAX-EXTRACTOR.

those days I also devised several steam and water extractors. The general plan of the steam machines was after the plan so commonly used in the Swiss and other machines—a perforated basket to receive the combs above a chamber or kettle of boiling water, the wax to drop into a pan and discharge through a spout at one side. The water method, or submerging process, was pretty thoroughly gone over, cheese-cloth, burlap, and other kinds of bags used. I went all through the boiling, punching, and stirring process, but every time with a feeling that all was unsatisfactory.

At one time I thought I had struck a grand idea, and proceeded to put it into practice. I made a boiler of such shape as to take a wire-cloth cylinder submerged in

After one season's use I have again made a change, returning to the center back discharge, loading and unloading from the house behind the machine. On previous page I give a half-tone view of the structure as it stands at the present time, and as it has been through this present season, and having handled about half a ton of wax this summer, and more than a ton of honey. As it now stands it is 4x16 feet, has the three-slope roof, and has the center discharge. I can still see some things that I would make differently were I doing it anew, but it is not a bad machine as it is.

First and foremost, we have always made a mistake in making our solars long way north and south. One made 4 to 6 feet long and 2 feet or less wide north and south, will get much more and continuous sun than when the length is the other way, made the old way with one south slope. It

further than to say that the glass used is, for the main part, 16 inches from bar to bar, some of it 10, and some 12 inches. As for the width the other way, it is all the way from 4 to 24 inches, a lot of it being waste glass picked up at the stores. To make the glass water-tight, the pieces are butted end to end after covering the edge with white lead. The bars are made of galvanized iron and plain bar iron, the galvanized iron bent at right angles, and bolted to the bar iron with stove-bolts. See Fig. 3 in the line cut. The bar iron is about $1\frac{1}{8}$ wide and $\frac{3}{8}$ thick, for a reach of a little over 4 ft. These sash-bars should always be of metal. The extremes of wet and dry, heat and cold, will invariably loosen the putty from wooden bars, but the metal will stay putted.

The two other photos show two inside views. One is taken from the west end, and shows the east-end melting-pan, the stirring-ladle, two honey-pails set in to liquefy the contents, and the wax and honey separator and two cooling-pans, the latter described in the preceding article. The other shows the wax and honey separator and pans, and beneath them is the honey-tank that receives the honey from the separator. This view is from inside the house looking out to the south. You will notice that the separator and cooling-pans are well up in the sun, the honey-tank beneath partly in the shade; thus the separator and cooling-pans are kept hot until the sun is well down in the afternoon.

Now look at Fig. 1. This shows the ground plan. It really needs no comment, more than to say that the walls as represented are about three feet high. Fig. 2 is a view of the south wall of the brick house against which the solar is built. This view is also looking south from inside the house. 1,1 are the doors through which the melting-pans are loaded, and 2 is the door to the wax and honey pit, these doors being open, and showing the glass roof beyond. The small door at the left is the furnace-door, the smoke passing around the pit (4) and entering the flue near B. The dotted lines A A represent the glass roof on the other side of the brick wall, and the lines B B show the melting-pans, or, rather, the smoke-tight metal surface on which they rest.

The furnace feature is by no means a small item. A fire built in it in the morning will have things warmed so that, as soon as the sun gets high enough to shine on the melting-pans, the thing begins work. A little fire beneath lengthens the working hours from two to four over the sun work alone. When I want to do a big day's work I put a fire beneath. Thus it melts from both top and bottom, and I have had wax running by 9 A. M., and remain liquid until sundown.

It will be wise to give a word of warning as to the construction of the furnace parts. Build the brick walls not less than 3 feet high at the point of putting on the smoke-

is the east and west walls that cast the shadows. If one does not care to bother with the hip or three-slope roof, make the machine just one length of glass north and south, and the east and west length just as long as you wish, according to pocketbook and convenience. Also, put it against the south side of some room or house if you can. A small room may be made for the purpose, and in this keep wax, slungum, etc. Handle every thing inside, and away from the bees.

I have made some sketches and also some photos, and from these the reader will have little difficulty in understanding the plan upon which I have constructed my solar. First, look at the photo showing the whole thing, together with a portion of the building back of it. This needs no comment

tight covering. This covering I made of common black sheet iron. Boiler iron, flag-stone, or cement would be better, because the thin iron rusts out too quickly. I laid the iron on the brick in mortar, then brick

tight enough that the fire burns slowly all day. Five to ten cents' worth of coal will run it all day, and adds very materially to the quantity of work done in a day.

Right over the fire-box there will be intense heat; and to prevent the burning of wax and honey at that point, there should be a check or break—that is, a double, treble, or even quadruple floor. I accomplish this by putting in two or three extra floors above the fire-grate before putting on the final smoke-tight floor.

I would call attention to the fact that, with the length east and west, and but a very short width north and south, the sun shines in about as many hours as it would be effective were the machine faced about from time to time to front the sun; and also to the fact that, with a moderate slope to the melting-pans, there is no shadow in the top part of the pit until the sun has gotten so low as to have little melting power. Also to the fact that, when there has been a fire beneath, there is so much heat in the brick walls that the wax remains liquid as

long as the sun will continue to melt under the most favorable conditions, and this keeps the whole interior hot, and favorable to the best cooling and caking of the wax.

In operating this solar I put in a large

INSIDE VIEW OF AIKIN'S SOLAR WAX-EXTRACTOR.

Shows wax-pan in the east, and also wax and honey separator, and two cooling-pans.

and mortar on this again. This iron is made to pitch or slope toward the pit from all directions, just enough to cause any wax, water, or honey that might get in on it to run out; otherwise, when hot the wax or honey will burn and smoke.

Now I come to a part that there should be no mistake in—the arrangement of the furnace. Make the smoke and fire chamber plenty deep—don't make the mistake of getting it too low or shallow. Make the fire-box and grates as close to the ground as you can get them, and still have an ash-pit under; then have the opening into the chimney at least six or eight inches higher than the top of the furnace-door, and the smoke-tight floor over all several inches higher than the opening into the flue. If the opening into the flue be made at the same level as the furnace-door, the smoke will back out at the door every time a fire is started. You can not get the door to the furnace too much below the point at which the smoke enters the flue, and there should be no point between the flue and furnace as low as the top of the furnace-door. The smoke-tight floor between the melting-pans should be several inches above the point at which the smoke enters the flue, because then the hottest air will hold right up against the floor. This conserves the heat and saves wasting the flue unnecessarily. Arranged thus, there will be no difficulty about the draft when the fire is started; and, once heated and a slow fire kept going, it remains hot all day. After I get the fire going in the morning I put in a good supply of coal and shut tight the draft, at least

Looking south out of the house into the solar shows melting-pan, wax and honey extractor, and, beneath the separator and cooler, the honey-tank.

amount of comb, cappings, or whatever I have to put through it, then let it remain in for several days, stirring and mixing the mass from time to time so I may be in the vicinity of the solar. When considerable slumgum is accumulated, and I want to make a clean-out, I put on an extra heat by firing underneath, and stir and mix the refuse so as to get as much as possible of the wax out; then in the evening, while still warm and soft, shovel out into some receptacle to remelt in water, and put under pressure. I have no press yet, but have had a neighbor work over my slumgum in his press. The solar will not take nearly all the wax out, nor will the water-bag-punching process. A press is a necessity and a money-saver.

A WAX-PRESS, WHY NEEDED IN CONNECTION WITH A SOLAR EXTRACTOR.

You will now say, If we must have a press, why build a solar? I will tell you. There is scarcely a bit of comb, burr-comb, cappings, or whatever you want to melt, but has in it more or less honey. If you put these through the water process in either bag or press, you lose this honey. The saving in honey that can be used in feeding or in vinegar-making, and even for table use, will soon pay for several solars. It also saves time and loss in other ways, and the first run of wax that is gotten by the solar is brighter and nicer than can be had by the wet process. One who has never used a solar will have little idea how much honey can be accumulated by means of the solar—just that much saved. The slumgum taken from the solar can be worked by the press later at your convenience. I will go so far as to say that, with a solar of ample room, I can get almost as much wax out of old combs as by the steam and water methods where no press is used.

As to the proper construction of a press, I wish to make this suggestion. The whole press and bag of slumgum should be submerged in water. I am so thoroughly convinced of this that, when I have a press made, I want it so constructed. I want the wax all floated above and away from the press, and, being submerged in boiling water, every bit of wax released will leave the cheese and press; and, too, there will be no need of great haste to get the pressing done before it is too cold to work. To accomplish more perfect extraction, the screw may be released as often as you choose, and thus the water enters the cheese and will bring away more wax when again pressed. These thoughts are in part theory, but worthy of consideration. I know a bee-keeper who is remodeling a heavy and expensive press that he may get the whole submerged in hot water, and he has done quite a little experimenting with this wax problem.

Right here I wish to make the prediction that, in certain fields and under certain conditions, wax will be no mean part of the product of the apiary. I find it is possible

to pay a very large part of the expenses of running an apiary out of the wax sales. Like many others I have found that we have been throwing away money in slumgum, and that in other ways wax is wasted in great quantities.

Later.—Since writing the above I have read the discussion at Buffalo on this subject, and observe that the prevailing opinion favored a *submerged* press. This coincides with my views on the matter. However, I have never used the press yet, but speak partly from theory. R. C. A.

[Although this article is long, it is good in proportion to its length. I myself believe, and have so stated, that the solar wax-extractor has its place. I believe that nearly all refuse, so far as possible, should be put through it first, because the wax that the sun renders out is of a superior quality. But the slumgum from the solar and old combs should be put through the wax-press. A bee-keeper who thinks he can get along without a press of some kind is probably throwing away gold dollars by the handful.* All refuse from the sun machines should be by all means saved.]

The question whether steam or hot water should be used in connection with a press is an open one. So far we are inclined to favor steam. The objection to hot water is that it takes up so much bulk that there is little room for wax. A steam-machine of a given capacity need be only a third as big as one for hot water of the same output of wax.—Ed.]

A BIG HONEY YIELD IN CALIFORNIA.

We are just advised by J. B. Radcliffe, of Helix, San Diego Co., that he took 19,000 lbs. of honey from 50 colonies, spring count, last season. Mr. Radcliffe's word is above questioning, and we offer this as a news item for GLEANINGS, and as an evidence of the fact that "you can't keep a good State down." ARTHUR E. RAZE.

Los Angeles, Cal., Jan. 14.

[This is large—very large; and were it not for the "off" years California would far outstrip any other locality in the world, and it comes near doing so as it is.—Ed.]

THE RAMBLER IN CUBA.

Friend Ernest:—We have just had a visit from Rambler, and enjoyed it very much. The first day we went back to the mountains over pretty poor cow-paths. It took

* A Hatch-Gemmill press is something that almost any one can make for himself for three or four dollars, and there is no excuse why one should not have one, because it will pay for itself in short order. For description, see GLEANINGS, page 279, April 1, 1901.

all day, but his cyclometer showed only 35 miles.

The next day we went out to some pretty little lakes and looked at the alligators—about 40 miles—but some good road among it.

The third day we proposed to go to the south coast, and (would you believe it?) he said that, if it was just the same to us he would go out and see Mr. Moe first, and take the trip some other day.

I have read all the Rambles as they came out in GLEANINGS and some way got the impression that the author loved to ramble around; but I find that he prefers to take his rambling in smaller doses.

Jan. 1st GLEANINGS just came. A man who will use the same wire to prod into different colonies for foul brood is not a competent inspector, and ought to be removed.

HARRY HOWE.

Artemisa, Cuba, W. I., Jan. 3.

SOME LARGE HONEY YIELDS; HOFFMAN FRAMES VS. NAIL-SPACED FRAMES.

I have taken 2600 lbs. of honey from my 11 colonies of bees.

I had the misfortune to lose my fine queen last August. I was very careful of her; but one day, about Aug. 6, she disappeared, and I noticed new queen-cells started. She was not in the hive, and I could not find her on the ground. I clip all my queens. This colony did not make any attempt to swarm or to supersede her. I lost three of my best queens the same way this year. Several of my colonies gave me 275 and 300 lbs. of honey; but this one gave me, up to Aug. 11, 377 lbs.; and if they had kept their queen they would have given me over 500 lbs. of honey, as they had given me, at the time of the loss of my queen about 165 lbs. more than any of my other ten colonies.

I see on page 929 that Dr. Miller prefers wire nails to staples or spacers. I do not think there could be a worse thing attached to a frame, to catch in the pocket of the extractor, unless it would be a hook. Give me the Hoffman frame in preference to any of them.

H. E. J.

San Marcia, New Mex., Dec. 10.

HONEY STATISTICS.

As I was asked to write an article on bees or bee-keeping for one of our newspapers, could you kindly give me some figures as to how much honey the United States exports, and how much do two or three of our largest States produce? Who is the largest bee-keeper, and how many members has the National Bee-Keepers' Association?

W. E. HEAD.

Paris Station, N. Y., Dec. 5.

[There are no data as to the number of pounds of honey and beeswax exported from the United States, and I can, therefore, give you no information. In a good year California might produce 200 cars of

honey, Colorado somewhere about 40 cars, and Arizona 20 or 30. New York is another good State, but probably does not produce all told to exceed 100 cars. But the honey is not exported from New York, it being consumed largely in the county where it is raised.

There are something like a thousand members of the National Bee-keepers' Association. You could get the exact number by writing to General Manager Eugene Secor, Forest City, Iowa.

The estimate of the number of pounds of honey produced in the United States is somewhere about as follows: For comb honey, 50 million pounds; for extracted, about 125 million, or a total money value of from eight to ten millions of dollars.

Capt. J. E. Hetherington, of Cherry Valley, N. Y., and W. L. Coggs shall, are the two most extensive bee-keepers in the United States. The former is credited with owning 3000 colonies, and the latter about 2500.]

BRODBECK'S DOUBLE VENTILATED HIVE-COVER.

I can fully indorse the hive-cover that Rambler illustrated in GLEANINGS for March 15, page 232, of last year. I had been requested a number of times to present it to the public, but wished to give it a thorough trial before doing so, and now after five years' use in my apiary I prefer it to any other combination of hive-cover

and shade-board in use. I advise the use of a single board for each side, for the lapping or grooving together of two pieces in the center will result in warping in spite of all nailing, etc. I prime all boards thoroughly on the under side before I nail them up, and have one here now to be exhibited at our State meeting, which has been in use five years, and seemingly as good now as the day it was nailed up.

GEO. W. BRODBECK.

Los Angeles, Cal., Jan. 10.

HOME-MADE WAX AND HONEY EXTRACTORS.

1. Please tell me how to make a solar wax-extractor—that is, give size and style which you most prefer for about 25 colonies, and what kind of glass to use. Will window glass do?

2. Do you think it would pay me to make my own honey-extractor—that is, to buy the gearing and all that is needed, and get a tinner to make the can? My tinner offers to make the can out of galvanized zinc for twelve cents a pound when finished. Do you think I had better do that or buy one already made? What kind would you recommend for me?

3. Do you think sweet clover would grow here in Southern Indiana, about 20 miles north of Evansville?

4. What do you think about this country for a bee business? Do you think it as good as where you are, or as good as most of the States? I kept bees for about three years. Last year was the only one I got any honey to amount to any thing, which was about 32 lbs. per colony. How much do you generally average? How many colonies do you keep? H. F. BUCK.

Buckskin, Ind., Jan. 10.

[Dr. Miller replies:]

1. The essential thing in a solar wax-extractor is to have an arrangement that will let the sun's rays in, and at the same time will not let the heated air escape; and along with that a chance for the melted wax to separate from the debris. Take a box covered in any way you choose with glass; put in that a dish to hold the melted wax, and over that a dish of wire cloth or perforated metal to hold the combs to be melted, and you have a solar wax-extractor. Common window glass will do all right. The size required for 25 colonies might vary considerably. Some would have much more wax to melt than others. Probably an extractor with a glass surface of one square foot would answer, although one of larger size would cost not much more and would be more satisfactory. Use tin for the dish, and wood for the box. Let the glass be half an inch or an inch above the top of the tin dish. Two thicknesses of glass half an inch or more apart would be better than a single thickness, but I doubt if it would be worth while. It is quite possible, however, that, if you have much wax to extract, it might be economy to get one of the new steam-extractors.

2. I suspect it would be a little more satisfactory to get the whole thing ready made. The tinner may make it all right; but when it is finished, if something proves to be out of whack, there you are. The ready made is sure to be all right. A novice extractor would do all right for 25 colonies, but it isn't at all certain that you may not go considerably beyond that, in which case a two-frame Cowan would be much better.

3. I don't know whether any grows in

your locality, but I don't believe there's a township in Indiana where sweet clover will not grow vigorously.

4. Probably your locality is as good as and possibly much better than my own. Taking bad and good years together, the average here is somewhere between 30 and 40 lbs. per colony. I have at present 235 colonies.

If thy brother trespass against thee, rebuke him; and if he repent, forgive him. And if he trespass against thee seven times in a day, and seven times in a day turn again to thee, saying, I repent, thou shalt forgive him.—LUKE 17: 3, 4.

In considering these two verses I wish to confine my talk to one point—to that phrase in the third verse which says, “If he repent,” and the same point in the next verse. We can forgive people for injury done us, even if they do *not* repent; and I suppose that is the right and proper thing to do—the Christianlike way of doing in the majority of cases. But perhaps we might consider the real definition of that word *for-give*. A great many times even good Christian people will say, “I will forgive, but I can not forget.” Now, in one sense we should both forgive and forget. We should not cherish malice nor hold a grudge. But in another sense it is not *right* nor *Christianlike* to forget. There has been much said in the papers of late in regard to the “pardoning business” in the criminal courts in Cleveland. The mayor, and director of charities, Rev. H. R. Cooley, have been doing an unusual amount of pardoning people and letting them go after they were arrested and found guilty of crime. I will not stop here to discuss which side is right and which is wrong. Perhaps I may say, however, that a good many have been let go when the good of the community demanded they should have been kept in the workhouse or behind prison bars. In discussing the matter, the point that came up strongly was, “Is this man you have pardoned in for his first offense, or is he an old offender?” If the latter, it makes quite a difference; and it is perfectly right and proper that the police and criminal courts should not forget that the man in question has been up for a similar offense before. Sometimes, perhaps in only a few cases, a man was not only an old offender, but he went back to his old trick of picking pockets and the like just as soon as he was let loose. His repentance was only *pretended*—no repentance about it.

When an offender is truly penitent he should most assuredly apologize, even if he does nothing more. Where one does not apologize, but just goes right on without considering, or paying any attention to the

fact that he has wronged an innocent party, it is a question, as I look at it, whether he should be *either* forgiven or forgotten.

A few months ago we were having a big fight with the brewers and saloon-keepers. They were determined the canteen should remain in the army. They got men high in office to back them up. The newspapers of our land, especially the great dailies, a great part of them, gave place to the most ridiculous false statements in regard to the effect of depriving (?) soldiers of their beer. In fact, the thing got a going to such an extent that good Christian people—yes, and some *ministers of the gospel*—believed these ridiculous and unreasonable falsehoods to be facts. They said it seemed, from careful reports from good authority, that the canteen was a *temperance* measure; and then they quoted what the papers said. The Prohibition party, the Anti-saloon League, the W. C. T. U., and other temperance organizations, invested both time and money to sift these statements to the bottom. They came out promptly with facts that could not be disputed. They then asked these great dailies, and other papers that have given place to strings of falsehoods in regard to the matter, to please correct, giving them any quantity of facts, and letters from the proper officials, demonstrating beyond dispute that the newspaper statements were falsehoods, oftentimes made out of whole cloth, put out by those interested in pushing the liquor-trade. Most of you know how it turned out. Very few indeed of the newspapers gave place to a correction and refutation of these pernicious lies. Sometimes in some obscure corner they put in a very brief note to the effect that the disasters consequent on abolishing the canteen were not so bad after all. Not one of them, that I know of, unless it was a religious paper, apologized for having unwittingly defended the brewers, or expressed any regret whatever, that they had been entrapped into serving the prince of darkness. After General Miles came out with his sweeping declaration, the subject seemed to be dropped; and, by the way, it seems to me we temperance people have not thanked God as we ought to have done for a man in authority, like General Miles, to come forward at such an opportune moment. If I have not said it before, let me say it here, *may God be praised* for General Miles; and may all good men and women stand by him. The matter seems to have been dropped pretty generally; but I for one do not feel like dropping it just yet. I fear the disgraceful and shameful example set by these great dailies is going to establish a sort of precedent. Yes, it has already started a fashion of wronging innocent men or an innocent class of people, and then refusing to retract or recall the wrong statement. I once heard a story of an editor who, by mistake, gave an account of a man's death. The man came into the office considerably stirred up. He stood before the editor, and pointed to the

passage. The editor said, "Well, what of it?"

"You said I was dead. Now you know I am *not* dead; you see me standing here before you. I want you to retract and apologize."

The editor very mildly replied:

"No, my friend, we can not say that we were mistaken. An *editor* never makes a mistake. We will do this, however: We will say you have come to life again; that we have seen you, and know it to be true."

Of course, this was sarcasm; but it is a fashion among periodicals and even home papers that ought to be rebuked. I suppose most of you see already what I am driving at. By a mistake or blunder somewhere—yes, a stupid, senseless blunder—almost every periodical, big and little, thought it a fine thing to dish before their readers the fact that comb honey is now in this new century really made in large factories, out of glucose and paraffine. Permit me to say right here the bee-keepers of our land have done nobly in protecting their industry from the damaging scandal. One editor said, in a sort of pleasantry, that he did not know there were so many bee-keepers on the face of the earth. Another thing, he did not know what a pugnacious, vindictive set of people they were, before. This editor had been a little backward about retracting, and I presume likely his patrons who were producing honey more or less almost snowed him under with protests. He said he would have to buy a bigger waste-paper basket if the thing kept on; but he finally came out with a pretty good apology. Of course, this story is old, and has been popping up a good many times. It makes one think of the seven times a day mentioned in our text, and it is right we should forgive and forget; but, as I see it, *before* we do this the editor of the paper needs to make at least some feeble attempt to undo his wrong. Does anybody ask *what* wrong? During the holidays, when comb honey has usually a large sale, a large dealer in Cleveland, who had a ton or more of honey from us, wrote that, for some reason he could not explain, the sales of honey had suddenly dropped, and that at a time of the year when it is very unusual. This dealer had not probably noticed the scandalous statements in the papers. I do not know whether our bee-keeping friends, in writing to these stubborn and contrary editors, told them they could not consent to bring into their homes a periodical that would refuse to correct an injustice and injury, whether done ignorantly and carelessly or not. But I *do* advise that, when a mild letter to the editor of your home paper fails to stir him up to a sense of justice, you should tell him in plain black and white that he must be fair or you do not want his paper. I think the moral tone of the press the world over would be greatly improved if the editors got more such letters. Dictating to an editor that he should agree with you on politics,

finance, or religion, is, of course, another thing; but when you have given him abundant proof that he is wronging an innocent class of people, and he refuses even to try to undo the wrong, then with draw your patronage and support. Our text says, "If he repent, forgive him," even though he should ask to be forgiven seven times in one day.

Now, there is another aspect of this matter that not only vexes me but it perplexes me. When the canteen falsehoods were up we could readily understand the editors had some personal interest in the matter, because a great many of them love strong drink. Perhaps I am mistaken in saying this. God knows how gladly I would retract and apologize if I could be convinced of my mistake. No doubt many of them had feelings on the subject. They felt hostile and bitter toward us temperance people who were continually trying to curtail their "liberty" as they expressed it. There was some *sense* and some *reason* in their refusing to retract and apologize. But how about the bogus comb honey? I suppose a good many papers gave place to the story because people are always interested in being told that this, that, and the other thing is manufactured. The subject of artificial hen's eggs bobs up every little while, and lots of good people whom you would think ought to have some brains in the place where brains are supposed to be, believe it is true! I have never yet heard that anybody believed strawberries are manufactured; but I do not know but it will come next strawberry time. Well, these editors gave place to the comb-honey scare because everybody would lift up their hands and say, "Did you ever!" The father of the family would read the newspaper in silence, until he came to the part about bogus honey; but such a morsel of scandal as that must be read aloud to the whole family, and then the good mother would remark, "Well, I thought that last honey we had tasted a little queer, and it looked too white and handsome to be genuine honey. I guess we will not buy any more."

Let me tell you a little story about how foolish gossip may harm even a market-gardener. When the Stratagem peas first came out I bought quite a lot of the new mammoth pea in order to astonish our patrons pleasantly. The first day they were put on the wagon they made quite a sensation, and there were not enough to go round. Pretty soon somebody started the story that these great peas were the result of using night-soil in our market garden; and I was told that one Medina *doctor* said people had better not use them, as they might convey contagion. Now, the truth was, we had not used a particle of night-soil on our grounds that year, and never used any of any account. I told the men on the wagon to contradict the story and explain to the people that it was a new variety, larger than any thing we had ever had before; and I thought of having them carry along

a catalog to show our customers a picture and description of the new pea. We should all be exceedingly careful about passing along any piece of news, especially where it is likely to damage innocent hard-working people. Perhaps I might say right here one newspaper was so stubborn, after being repeatedly corrected, the editor still insisted there were large factories where comb honey was produced, and that, in his opinion, The A. I. Root Co. was probably making more of it than anybody else. He said our reward card was simply a bluff to hide our real business and work. After his attention was called to the fact that he was liable to fine and imprisonment, he promised to make a retraction; but he would not do it till his friends and fellow-townsmen had urged him to desist from the folly of the course he was taking. By the way, if any of you hear such stories as this, you might tell people our establishment is always open to investigation; there is no locked-up room on the premises, and never has been. Every thing we make and all we handle is open to the inspection of anybody who is curious, providing he will go to the office, make himself known, and get a permit to go through the works.

Of course, I am not thinking of personal matters in talking about forgiving and forgetting. If anybody wrongs me individually, and I can not persuade him to make it right, I would, as a rule, call it "spilled milk" and let it drop. But where community at large is being injured, that is another matter. If a man cheats you in a deal, you can forgive it and let it go and treat him pleasantly; but if he is engaged in making counterfeit money you would be guilty *yourself* if you let him go on by failing to report him to the officers of the law. I have never yet been to law with a neighbor on account of some personal deal; but where a man persists in slandering our whole industry, I would not only fine and imprison him, but I would send him to jail even though he were poor and needy, unless he retracted and made amends for the mischief he had done. Jesus said, "I came not to bring peace but a sword;" and that sword, as I understand it, means that he would uphold the law and punish crime. Again he said, "Think not that I am come to destroy the law or the prophets."

We take the following from *Agricultural Experiments*, published at Minneapolis. As I understand it, the work was done by the editor of the periodical:

In the latter part of January, 1901, we sowed several kinds of seeds in a small window-box, simply to test their vitality. The lot included two varieties of tomatoes, Acme and Dwarf Champion. When from one to two inches high, the young plants were transplant-

ed; and when averaging eight or nine inches in height, we decided to give them the better accommodation of a hot-bed, then just ready for them. Each plant was placed in the center of a quart-sized strawberry-box; the boxes were closely packed in order in the frame, and enough dirt put in to cover them to the depth of fully two inches. When the plants were too high for the frame, we placed another 12-inch board on top, and our memorandum shows that, by April 29, the foliage was pressing against the glass, and the first blossoms were in evidence. The plants had also been allowed considerable fresh air on warm days, to harden them for the next and final change.

The transplanting to the open ground occurred about May 10, into a sheltered spot on the south side of a barn. The setting was quite deep, in some cases covering six or eight inches of the stalks. No pruning was done at that time, nor were the plants trained or tied up at any time thereafter, excepting as necessary to keep them off the ground. About 65 plants made up the collection, and they had been held back as much as possible in their growth up to this time. But from this time on we did all we could to hasten their development.

Every night for two or three weeks the plants were carefully covered, each one having a gunny sack drawn down over it, supported on stakes. Later in the season, in caring for more than a thousand plants before danger from frost was past, we found other methods of protection, simpler and more effective. Now for results.

I find these entries in my diary:

June 27.—Picked the first ripe tomato.

July 1.—Took six pounds of choice tomatoes to the city.

July 11.—To day Yerxa paid me \$2.25 for 18 pounds of tomatoes; very smooth and handsome.

Further items of this kind might be taken from my cash-book, but I think I have given sufficient proof that early tomatoes can be grown in this latitude in the open ground, if started properly. Comparing this record with the published report of experiments with 56 varieties tested in one season at the New Hampshire State Experiment Station, I find reason to call my first products "early." Their record of first pickings is as follows:

From one kind, July 8; from three varieties, July 16; one the 18th; ten the 24th; one the 27th; seven the 29th. The first fruits of 23 kinds came in July, and of 33 varieties from Aug. 1 to 21. Average date for the entire lot, August 2.

In my unprofessional experiment I have established a record which I expect to beat in the future.

The above is not a difficult thing to do, as I have demonstrated again and again, by starting tomatoes in the greenhouse. The price of the early tomatoes is always enough to pay handsomely for all time and trouble. And this is not all. If you are located near the road where you can show good strong thrifty tomato-plants growing in quart boxes, you can sell almost any quantity at from 5 to 10 cents each. Where they have blossoms on, or, better still, small fruit, there is no trouble in getting 10 cents for a plant, box and all. The Dwarf Champion is an excellent tomato for this purpose. But the new plant called Earliest in the World will give you tomatoes quicker, and the plant blossoms when so small that it is an excellent one to go in boxes. Now is the time to sow your seeds if you want to try your hand at it.

FLOWERS THAT DO NOT FADE.

I have been having much enjoyment lately in that little greenhouse, and I want you to share part of it in something I am going to tell you about. A vase of flowers, even if it is only a very small vase and a few little blossoms, adds much to the charm of the breakfast-table—yes, the dinner-table and the supper-table too. But it is something

of a task for the good wife to keep such a vase bright and fresh; and in the winter time it is not always easy to find the "posies." Now, I will tell you what you are to do. Get a rather deep sauce-plate—a square one if you can find it. Fill it with some sort of white sand—silver sand, for instance; or, if you can not do any better, get a piece of soft white sandstone and pound it up. I got mine by the side of the railroad track. It ran out of the sand-box of the locomotive. It is almost as white as sugar. Now, having wet this sand so it is about like mud, fill it with cuttings. In the corners I would put some sprigs of lycopodium, for instance; a little further back put some California moss, or what florists call mesembryanthemum; then put in some sprigs of geranium, pelargonium, salvia, etc. I have mentioned salvia because it (especially the golden leaf) grows so rapidly from cuttings. Get a sprig of bloom for the center if you can; then take slips from any sort of house-plants. Ivy geranium takes hold beautifully. Of course, coleus is prettier than almost any thing else; but your dining-room must be very warm if you want it to thrive. Select slips from almost any sort of plant with a bud on, and they will blossom in the sand just about as well. Now all you have to do is to keep the sand wet. You all know about starting geranium and other plants in a bottle of water. Well, this is on the same principle. But a bottle is unsightly any way you can manage it. A tiny dish of white sand kept wet will not only keep blooms of almost any kind better than any vase, but most plants will start and grow. Your greatest difficulty will be that the air of your living-room may be too dry. To obviate this, you want a glass vase, or any kind of glass dish or cover, to set over your little cutting-bed (only at meal time) to hold the dampness. With a little ingenuity you can manage it so as to have a bouquet of flowers and beautiful sprigs of foliage that will be growing all winter long.

When your plants have roots half an inch long, put them in little pots and you will soon get to be a florist on a small scale. You can get sprigs and cuttings from any other kind of house-plant. If there are no house-plants in your home, go visiting to your neighbors who have them.

I forgot to say that *Impatiens sultani* is one of the very prettiest plants for this method of propagation. It needs, however, like the coleus, to be in a room that is rather warm, say 50 to 60 at night, and 65 to 70 in the daytime. Now, bear in mind if you should at any time let the sand get dry, your cuttings, or at least most of them, will "go dead."

S. W. Pike, of St. Charles, Ill., will furnish you rooted cuttings of all the plants I have mentioned, and ever so many more, for 2 to 5 cts. each; lower prices still by the dozen. All who are interested in house-plants had better send for his little catalog of rooted cuttings.

THE "RED-ALBUMEN" SWINDLE.

This thing that has been having the run of the papers has been finally traced to the notorious "Bain," of Zanesville, O. Not only have the poultry-men been swindled, but the druggists as well. The article sold as red albumen at 50 to 75 cts. per lb. is really worth only 3 or 4 cts.; and its worth for making "hens lay" is just nothing at all. If you have a friendly interest in your druggist, tell him he had better let the stuff alone, even if everybody is inquiring about it and wanting it. Somebody is going to "get left" with a stock of it on hand.

COLD-WAVE FORECASTS AND THE WEATHER BUREAU.

Some of our readers may have noticed that on Friday, Jan. 24, the Weather Bureau said a cold wave would reach us by Sunday or Sunday night. This, you will notice, was a forecasting three days ahead. Well, Saturday night came, and Sunday and Sunday night, with no cold wave in sight. A good many began to ridicule the Weather Bureau. But by Monday morning there had been a fall of 35° in 12 hours. The explanation was that a warm wave swept in from an unexpected quarter, and crowded the cold wave back. Sunday afternoon, however, I received a telegram that the cold wave would be on hand Monday morning sure; and it is here yet, Jan. 31. The only trouble in this case was that the forecast was driven back so that it was from 30 to 36 hours late.

BERT COOK, PRESIDENT OF THE MICHIGAN STATE ASSOCIATION OF FARMERS' CLUBS.

For several years I have been wondering why Bert Cook, son of Prof. A. J. Cook, had not been pulled forward a little more into public life—something like the life of his father, for instance, during the early and middle part of his life in Michigan; hence I was greatly pleased to find in the *Michigan Farmer* for Jan. 18 a most excellent picture of Bert Cook, or A. B. Cook, as they call him, with the notice that he had been chosen President of the State Association of Farmers' Clubs. I know something of young Cook's ability, from having met him many times at his father's home; and I do know, too, that his lamented mother was a jewel among women. With such a parentage it has seemed almost wrong to me that young Cook should continue hiding his light under a bushel, even if he does enjoy himself more alone out on the farm than anywhere else. When he gets to be sixty or more, we will try to excuse him, and let him go off, even into the big back woods of his beautiful State, if he feels like it. Just now, however, we want him in the front, where he can do his native State such a service as his excellent training and parentage have so eminently fitted him for.

SPRAYING FRUIT-TREES.

The question of spraying fruit-trees to prevent the depredations of insect pests and fungus diseases is no longer an experiment but a necessity.

Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalog describing twenty-one styles of Spraying Outfits, and full treatise on spraying the different fruit and vegetable crops, which contain much valuable information, and may be had for the asking.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

QUEENS FOR 1902

Having secured from G. M. Doolittle the breeding queen from which his apiary was stocked, that produced such excellent results in comb honey the past season, and being now entirely recovered from my illness of the past few years, I am largely increasing my queen-rearing facilities; and there will be no delay in filling your orders whether it be for one or 100 queens. Those needing queens in early spring, and who require the best golden stock for honey-gathering, mailed promptly, and at very reasonable prices, will find mine to be of the HIGHEST QUALITY and INDIVIDUAL MERIT, as I am taking unusual care at all stages of their development, to insure the most favorable and natural conditions. No virgins are caged, nor are my queen-cells shifted about several times before hatching. I have also an excellent breeder from J. B. Case, as well as a Laws breeder, and one of Victor's Root Red-clover strain, and other choice stock; and am sparing no expense or labor to produce only the best queens. Your orders will be appreciated and promptly attended to. Circulars free.

Geo. J. Vande Vord, Daytona, Florida.

1902 ITALIAN QUEENS.

From imported and home-bred mothers, by up-to-date methods. Tested, \$2.00. Untested, \$1.00; six, \$5.00; twelve, \$9.00. Full colony, \$6.00; three-frame, \$2.00; two-frame, \$2.50; add the price of queen. Discount on large orders.

Listen, Bee-keepers! The Lone Star Apiarist

A new bee-journal in the great South-west, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world. With flowing wells, and the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now, \$1 a year. The *Apiarist* is not only for the South, but for all America and foreign countries too. Our company has purchased the *Southland Queen*, and now we have the only bee-journal in the South.

THE LONE STAR APIARIST.

OHIO CARRIAGE MFG. CO.,
Station 27, Cincinnati, Ohio.

ELGIN or WALTHAM 16-SIZE WATCHES -15- \$12.55 JEWEL \$10.50

These are the popular 16-size, smaller than regular 18-size and more convenient for the pocket.

Open Face, Stem Wind and Set.

The movement is nickel with 15 jewels, settings, exposed pallets, cut expansion balance, patent breguet hairspring, hardened and tempered in form, patent micrometric regulator, tempered steel safety barrel, exposed winding wheels, polished and red gilded center wheel and jewel settings.

Choice of either Elgin or Waltham Movement.

We have these fitted in two styles of cases, both open face, as follows:

GOLD FILLED These are handsomely engraved, gold-filled and warranted **\$12.55**
Guaranteed for 20 years. Delivered

by makers to wear 20 years or will be replaced free. With this case you will have a watch equal to any in appearance and a guaranteed timekeeper.

SILVEROID. This case is SOLID composition metal of nickel and silver will wear same all the way **\$10.50 Delivered**
through, and is not plated in any way. We use it because many people want a first-class movement but do not care for an extra fine case. Just the thing for everyday use as it is heavy with thick crystal to protect the works. Our supply of these is limited, so do not wait too long. Compare our prices with retailers and see the saving. Remember that these are the popular 16-size thin model and much handier than old style 18-size.

GUARANTEED EXACTLY AS REPRESENTED.

We will refund money if not satisfactory or send them by express C. O. D. subject to examination. Address **OHIO FARMER, Cleveland, Ohio.**

Like Having A Doctor in the House

to have a copy of our Mammoth Illustrated Catalogue of Drugs, Medicines, etc. It contains anything you could possibly want for the treatment of any disease of either man or beast. It contains over 15000 drugs, medicines, home remedies, veterinary remedies, trusses, instruments, extracts, paints, oils, etc.

We guarantee to save you from 15 to 75 % on any article you buy from this catalogue. These books cost us \$2. each. We mail them to you for 10 cents and refund that amount with the first order you send us. Order a copy at once and keep it handy. You can never tell how soon you may be in need of medicine.

Remember: We are "The Only Mail Order Drug House in the World."

Heller Chemical Co., Department 40
CHICAGO, ILL.

COMB HONEY.

When in need of comb honey let us supply you, as we have a large stock to select from. Our stock of extracted is very low, and we shall be pleased to get samples and prices from those having choice extracted for sale.

BEESWAX WANTED.

Our very large reserve stock of beeswax is vanishing rapidly in foundation orders being filled at the rate of two or three tons a week. We are, therefore, in need of more beeswax; and until further notice we will pay 27 cents cash, 29 in trade, for average wax delivered here. Send on your wax if you have any ready to ship.

MAPLE SUGAR AND SYRUP.

Those in need of maple sugar will do well to sample the lot we have to offer. It is very nice and cheap when you consider the scant stock to be had in the country. Price 10c per lb. in small lots; 9c by the barrel. We have also secured a nice lot of syrup, which we can furnish at \$1.00 per gallon, in five-gallon lots or over.

Special Notices by A. I. Root.

We have just printed for Flansburgh & Peirson, Leslie, Mich., their annual catalog of strawberry, raspberry, and blackberry plants, and potatoes. All interested in the very best that is raised in this line should send for this catalog. Their specialty this year is the Uncle Jim strawberry and the King of Michigan potato. As we are now out of the strawberry-plant business we would refer our friends to the above firm.

GRAND RAPIDS LETTUCE-PLANTS, ETC.

For immediate orders we can furnish nice transplanted plants at 30 cts. per 100; \$2.50 per 1000. If wanted by mail, add 10 cts. extra per 100. Seedling plants, before they have been transplanted, half the above prices, and postage one-half. Any customer for either seeds or plants may have "a small punnet" of Eugene Davis' "Gilt Edge" Grand Rapids seed free if he will just mention it. This should be used for growing seed.

SEED POTATOES STILL SMALLER THAN THE SECONDS.

Besides the seconds at \$2.00 a barrel, mentioned in our last issue, we have a limited amount of thirds of Bliss Triumph, Early Ohio, Bovee, Sir Walter, New Russet, and Craig. Those who wish to risk these for seed can have them, while the supply lasts, for, 1/2 peck, 10 cts.; peck, 15; 1/2 bushel, 25. They will grow all right, and with a longer season on good ground they will make a fair crop of good size. Of course, it takes them longer to get started. These potatoes are about the size of hickorynuts, some of them a little larger.

THE A B C OF STRAWBERRY CULTURE, NEW EDITION, REVISED AND GREATLY ENLARGED.

This is just now off the press. The first edition was published in 1890. Part 2 is a review of the progress made in the past 12 years, from 1890 to 1902, with sketches of strawberry culture in different localities all over our country. Part 1 is mainly by T. B. Terry; part 2 by A. I. Root. There are 235 pages, all together in the new edition, and 31 illustrations. The price has been advanced to 45 cts.; by mail, 50, in leatherette and gold; bound in cloth, 68 cts.; by mail, 75. We think the book is well worth the money to anybody who grows strawberries, even on a small scale. There has been one pleasing thing about all of these books by Terry; and that is, the demand for them has been much greater after being before the public for eight or ten years than when first published.

OUR BOOK ON MAPLE-SUGAR MAKING.

As it has been some years since this book was written by Prof. Cook, I recently submitted it to Prof.

Chamberlain, of Hudson, O. (as he is an expert in making maple syrup), to see if the book needed revision or an appendix to bring it up to date. After having given the book a careful examination, and sending for circulars from all those who furnish implements, pans, spiles, etc., for the industry, he replies as follows:

Hudson, Ohio, Jan. 25.
MR. A. I. ROOT: I had no expense, except a little postage in writing for circulars, which the circulars are worth more than the postage to me, for they show me I am up to date in my own methods, and that Prof. Cook's excellent little book is really and essentially up to date too.

W. I. CHAMBERLAIN.

I preferred to get the opinion of some one well posted in regard to the book, as we did not wish to furnish our patrons with a book or any thing else out of date; and just now is the season of the year for you to get the book to study it up, even if you have but little to do with making maple syrup or maple sugar. Price of the book, 25 cts.; by mail, 30 cts.

ANEROID BAROMETERS.

Some of our friends will remember I have had trouble in getting aneroid barometers that could be sent by mail without injury. One trouble was that I could not find where these barometers were made. I have now succeeded, however, in getting most beautiful and accurate instruments direct from the manufacturers. One is made in the old country, and the other one here in America. I am testing them carefully to see which is the better. Both instruments are so substantially made that I think they can be safely sent by mail—at least our experiments in the matter so far are a success. Best of all, by buying at headquarters I can keep the old price, \$2.50 each, if sent by mail, 20 cts. more for postage and packing. Where you can have them sent by express, however, with other goods, I believe I would advise so doing. I have for some time had two of these instruments hanging up beside my mercurial barometer, and they agree most beautifully. The aneroid, however, is rather more sensitive to changes than the old mercurial. For myself, while I am engaged in any kind of outdoor work I would almost as soon be without a clock as a barometer. Printed directions accompany each instrument.

OUR GARDEN SEEDS.

When we first started in the seed business I undertook to grow a large part of the seeds we offered for sale. This I found to be impracticable. Our trade did not require enough to make a great business of seed-growing. I found I could get seeds not only cheaper, but oftentimes better, by buying them of somebody who made a specialty, as H. A. March does with cabbage and cauliflower, or Clark with corn. Therefore we have been getting more and more into a way of having our seeds grown for us by experts, each in his separate line of seeds. This year more of our seeds are grown especially for us than ever before. Our onion seed and many other seeds are grown in California. We agreed to take a certain amount at a specified price before the seed was planted to grow the crop. We thus know we have absolutely fresh seed and nothing else—that is, knowing the man or firm that does the growing. Our tests in the greenhouse have shown better germination than ever before. Even the onion seed that I offered at half price on page 36—seed that is a year old—germinates almost as well as fresh seed. Another thing, where the seed is grown especially for the seedsman it is next to impossible that the seed should not be true to name. We shall be glad to mail our seed catalog for 1902 on application.

THE NEW HAND POTATO-PLANTER.

I have used the hand potato-planter long enough to give it a fair trial, but I can't say that I like it. It goes too slowly. In fact, I prefer to plant almost any other way. I have used a horse planter, but prefer to mark out the ground, drop by hand, and cover with horse. H. A. SIMON.

Warren, O., Jan. 8.

The Acme potato-planter was a grand success with me. I planted on ground that was not furrowed, and it planted too deep; so I tied a one-inch block under the lever, and it was all right. I planted some on tough sod, and it did the work all right. I let one of my neighbors take it to use, and he said he would like to get one like it. I would not do without it for four times its cost. M. WYRICK.

Cascade, Ia., Jan. 7.

The new potato-planter is a success with me. I have only a large garden, and have the soil worked deep, and finely pulverized, rolled level, and planted under a line. My plot is high and dry, and in so doing the moisture is retained by level working, not being ridged at all. I think some soils may not have enough sand, and the planter may not clean itself; but I find that, if we use reason, we can soon work

the tool to perfection. I also use it to plant corn. I am well pleased with the planter. S. S. FEIHEROLF.
Era, O., Jan. 8.

We sold over 200 of these planters last season; and, notwithstanding my invitation, only three people as above have made any reply. My impression is that friend Simon did not get the hang of the tool or else he is too old a man to learn new tricks—no disrespect meant by this. If he had given it to a good stout boy, and the boy had faith enough to follow his instructions, his verdict might have been more like that of the other two friends. I am glad to tell our customers that, by having a very large lot of these planters made up during the dull season, we can, this year, make the low price of 60 cts. each; three or more, 55 cts. each; half a dozen or more, an even 50 cts. A descriptive circular will be sent on application.

TO NEW JERSEY BEE-KEEPERS

Several of our progressive States have one or two bee-keepers' associations, and New Jersey should be able to place one to her credit with several hundred active bee-men. If time was ever opportune for an association, with a membership of several hundred, that time is now. The New Jersey Bee-keepers' Association was organized January 11, 1902. The next regular meeting will take place Saturday, March 1, at office of Mr. J. H. M. Cook, 62 Cortland Street, New York. Every bee keeper is cordially invited to be present. It does not matter whether you own half a dozen colonies of bees or a hundred dozen, you are welcome to join us in a cause that you know is worthy of advancement. From present indications the regular annual meeting of our association will be held at Trenton this fall, during the State Fair, at which place almost every person in our State who is interested in rural pursuits is generally found.

Cranford, N. J.

GEO. N. WANSER, Sec.

Wants and Exchange.

WANTED.—The sediment and slumgum from wax-extractors; also the propolis and scrapings of sections, hives, and brood-frames. Correspondence solicited. State what you have. Address C. H. LAKE, American Art and Specialty Co., 314 Cortland Street, Baltimore, Md.

WANTED.—A competent person to take charge of a comb-honey apiary.
CHEEK & WALLINGER, Las Animas, Colo.

WANTED.—To exchange gents' solid-gold watch, fine movement, and 22 rifle, for nuclei and queens; also 300 to 500 copies of GLEANINGS. Make me an offer on them. I want 200 colonies of bees cheap for cash in April.

BERT W. HOPFER, La Junta, Colo., R. F. D.

WANTED.—Apiary and small farm. Would buy or rent. Want good fruit and potato land, and sweet clover and fall bloom.

R. S. BECKETT, New Buffalo, Mich.

WANTED.—To buy raw furs for cash, especially skunk, opossum, raccoon, lynx, red and gray fox, mink, otter, and muskrat. Write for price list.

ELMER BROS., Bergen, N. Y.

WANTED.—To buy, rent, or engage in the bee business somewhere in California where there is a good chance for good schools. Twelve years' experience.

M. R. BLISS, Davis, Illinois

WANTED.—To buy 300 to 800 colonies bees in Colorado alfalfa and sweet-clover district. Write, with price.

C. H. WEEKS, West Groton, N. Y.

WANTED.—To buy one or more large apiaries at a cash bargain in good location where honey is of best quality, and not liable to crop failures. Write full description and price. Address

Box 581, Los Angeles, Cal.

WANTED.—To contract with Northern growers to furnish early garden plants to be shipped by express February to May. Onions, \$1.00 per 1000; other plants, \$2.00 to \$3.00 per 1000; can furnish onions in 100,000 lots. If preferred, will grow from seeds you furnish. I grow best early varieties.

ALBERT WITTENMYER, Ormond, Volusia Co., Fla.

WANTED.—Young man to assist in apiary of 250 colonies. State age and experience. No liquor or tobacco. Commence work March 1st. Address
M. P. RHOADS, Las Animas, Col.

WANTED.—To exchange for bee supplies or any thing I can use, one Monarch 600-egg incubator, and two Des Moines outdoor brooders, capacity 200 chicks each. All in good condition. Or will sell cheap for cash.
F. A. GRAY, Redwood Falls, Minn.

WANTED.—To sell or exchange two Excelsior incubators (260-egg capacity), one 150 chick brooder, and bee hives—any style, for well bred B. P. Rocks, W. Wyandottes, L. Brahmas, M. B. turkeys, Pekin ducks, Belgian hares, or offers.

H. R. MILLER, Fulton, Mo.

WANTED.—To exchange second-hand Barnes foot-power circular saw for a No. 15 Cowan rapid extractor, or offers.

E. E. LAWRENCE, Stanberry, Mo.

WANTED.—To exchange Barnes machine for bees, or incubator and brooder.

G. F. TUBBS, Annin Creek, Pa.

WANTED.—A young man of good habits as an assistant in my apiaries. Will start a man at \$20 a month and board. Steady employment and increased salary will be given on approved efficiency.

GLEN E. MOE,

Prov. Pinar del Rio, Candelaria, Cuba, W. I.

WANTED.—To sell at \$1.00 each, or exchange for beeswax or supplies, good healthy Belgian hares. Pedigreed stock, higher priced. No "snuffles" or other disease. Have never had a complaint from a single buyer yet. Satisfaction guaranteed.

RALPH B. DALY, Route 3, Lockport, N. Y.

WANTED.—To buy an apiary in Colorado, Michigan, or any good locality.

B. F. HOWARD, Binghamton, N. Y.

WANTED.—A competent man to take charge of my farm and apiary. Address

JOHN IFFT, Zellenople, Pa.

WANTED.—To exchange for cash or wax, one No. 25 Cowan extractor, 100 R-11 honey-boards, and 1901 make of Daisy foundation-fasteners. Bargains. Write to
M. H. HUNT & SON, Bell Branch, Mich.

WANTED.—To exchange 60-lb. cans, perfectly bright and good as new, 25c each, f. o. b. here, for honey or wax.
G. L. BUCHANAN, Holliday's Cove, W. Va.

WANTED.—To buy a second-hand saw-mill, heavy (top and bottom saw). 216 Court St., Reading, Pa.

WANTED.—A buyer for my 80-acre tract of land in Crawford Co., Mo., at \$10.00 per acre, one-half cash; balance on time payment. Address

LOUIS WERNER, Edwardsville, Ills.

WANTED.—To sell or exchange gasoline-engines for all purposes—stationary, marine, bicycle, etc.; want machinery of all kinds.

Robert B. Gedye, LaSalle, Ill.

WANTED.—To sell Rocky Ford cantaloupe seed. Seed of these famous melons postpaid, 40 cts. per pound. Choice selected stock.

H. F. HAGEN, Rocky Ford, Colorado.

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax.

O. H. HYATT, Shenandoah, Iowa.

WANTED.—To know who has 200 colonies of bees to sell cheap; also what young man would like to serve an apprenticeship with Quirin the queen-breeder.

H. G. QUTRIN, Parkertown, O.

WANTED.—To sell improved comb foundation. Send 10c for sample, by mail.

H. VOGELER, New Castle, Cal.

WANTED.—To exchange, 6-in. foundation-mill, and 140-egg Star incubator, for wax, bees, or cash.

I. J. STRINGHAM, 105 Park Place, New York.

WANTED.—Extracted honey. Kindly quote prices.
MYERS BROS., 234 Spruce St., Hannibal, Mo.

Now Ready!

Sixty-four Page Catalog

of every thing bee-keepers need. Illustrated and fully described. Especially valuable to beginners for the information it contains. Send your address on a postal and get it now. Established 1884.

J. M. Jenkins,
Wetumpka, Elmore Co., Ala.

QUEENS!

Friends, we are again preparing for queen-rearing on a large scale for 1902. We are headquarters for queens and nuclei in large quantities as well as for small lots.

Visalia, Cal., Sept. 19, 1901.
I want 24 queens just like those I got of you four years ago. I think that they were called Honey-gatherers. WM. B. PARR.

We can begin mailing early queens by Feb. 15. Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens, and how to keep bees for profit.

The Jennie Atchley Co.,
Beeville, Bee Co., Texas.

Kretchmer Mfg. Co., Red Oak, Ia.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apiary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of the Alternating Hives, Ferguson Supers, etc. Write at once for a catalog.

Trester Supply Co., 103 So. 11th St., Lincoln, Nebraska; C. C. Richards, 1223 17th St., Denver, Col.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1-1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

SAN FRANCISCO.—No change in prices since last quoted. The Association of San Francisco Commission Houses set the price—buying and selling—of honey, in consequence there is no advance in price to the producer, though wheat, hay, and all other crops have advanced in price, owing to the unusually dry winter. Clear and cold throughout the State at this date. Rainfall to date less than any year in past 30 years. Prospects poor for honey crop, and good for higher prices.
E. H. SCHAEFFLE, Murphys, Calif.

Jan. 29

CHICAGO.—Hope of February bringing a good demand for honey, is so far disappointing. The weather is extremely cold, yet this should not curtail the demand, for honey is a cold-weather luxury, and to most people more inviting when cold than when it is hot. Perhaps one of the causes (for there are many) was the holding back of the crop by producers in the early autumn, on the supposition that the yield was light, taking the country as a whole; the result was that consumers reasoned that it was going to be scarce and substituted other things in lieu thereof. Comb is freely offered, with prices weak at 14¢@15 for choice to fancy; No. 1, 13¢@14; amber and buckwheat, 11¢@12. Beeswax strong at 29.

R. A. BURNETT & Co.,

Feb. 7, 1902, 190 South Water St., Chicago, Ill.

SCHENECTADY.—There is only a moderate demand for comb honey, and most of that is for buckwheat, with some to offer. Extracted moving off fairly well, supply of dark quite limited. No change of note in prices of comb or extracted.

CHAS. McCULLOCH,

Feb. 8, 1902, 1 Eagle St., Schenectady, N. Y.

BOSTON.—There is a good stock of honey on this market, but should the demand keep up at its present rate we shall all be consumed before warm weather. We are not advising further shipments of comb at the present time. We quote fancy 1 lb. cartons, 15; A No. 1, 14½; No. 1, 14; practically no No. 2 being offered. Extracted light amber, 7½¢@8; amber, 7; Florida honey, 6¢@7½.

BLAKE, SCOTT & LEE.

Feb. 8, 31, 33 Commercial St., Boston, Mass.

NEW YORK.—There has been very little movement of late in comb honey, and while there is no buckwheat on the market to amount to anything, there is sufficient quantity of the different grades of white honey. The demand having been slow of late, prices have had a downward tendency and are likely to remain so during the spring. We quote fancy white, 14; and exceptionally fine stock at perhaps 15; No. 1, 13; amber, 11¢@12. Extracted remains dull at unchanged prices. Arrivals of late are quite plentiful of all the different grades. Beeswax firm at 28¢@29.

Feb. 8, HILDRETH & SEGELKEN.

CINCINNATI.—The honey market has been rather dull this year. Comb honey is selling fairly, and brings the following: White clover, 15; lower grades, 12½¢@14. Extracted sells very slowly, the lower grades bring 5¢@6; fancy, 6½¢@7½. Beeswax, 28¢@30.

C. H. W. WEBER,

Feb. 7, 2146 Central Ave., Cincinnati, Ohio.

MILWAUKEE.—The honey market is rather slow just now. It seems that the cold weather has a cooling effect on trade. Offerings and supply of extracted are good. Fancy comb is what is needed here, and we encourage shipments. We quote fancy 1-lb. sections 15¢@16; A No. 1, 14¢@15; No. 1, 13¢@14; amber, nominal 12¢@14. Extracted, in bbls., kegs, or cans, white, 8½¢@9; amber, 5½¢@7½. Beeswax, 26¢@28.

A. V. BISHOP & Co.

Feb. 8, 119 Buffalo St., Milwaukee, Wis.

BUFFALO.—Fancy white comb, 15¢@16; A No. 1, 14¢@15; No. 1, 13¢@14; No. 2, 12¢@13; No. 3, 11¢@12; dark, 10¢@12. Extracted white, 6½¢@7; dark, 5¢@5½. Yellow beeswax, 28¢@30; dark, 23¢@24. There is not much honey in our market. Demand is fair.

Feb. 8, W. C. TOWNSEND.

DETROIT.—Fancy white comb honey, 14¢@15; No. 1 white, 14; dark and amber, 11¢@13; extracted, white, 7¢@7½; dark and amber, 6¢@6½. Beeswax, 27¢@28.

M. H. HUNT & SON, Bell Branch, Mich.

NEW YORK.—Stock of comb honey on the market is almost cleaned up, and demand good for this time of the year. Comb honey will bring the following prices: Fancy 1-lb. clover, 15¢@16; A No. 1 1-lb. clover, 14¢@15; No. 1, 3¢@14; No. 2, 11¢@12; fancy buckwheat, 11¢@12; No. 1 buckwheat, 10¢@11; No. 2 buckwheat, 9¢@10. Extracted-honey market dull. Fancy white, 6¢@7; light amber, 6¢@6½; amber and buckwheat, 5½¢@6. Beeswax, 28¢@30.

CHAS. ISRAEL & LEE,

Feb. 10, 486-490 Canal St., New York City.

FOR SALE.—Four 10-gallon kegs white extracted honey, clover and basswood mixed, now candied, price 7½¢ cts. per lb. f. o. b. here. Also four 10-gallon kegs and five 5-gallon jacketed cans of fine amber honey just extracted, fine flavor and doubly ripened, very thick and waxy, 6½¢ cts. per lb. Large sample free.

O. H. TOWNSEND, Otsego, Mich.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.
EVANS & TURNER,
Town St., Cor. 4th, Columbus, Ohio.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.
SEAVEY & FLARSHHEIM,
1318-1324 Union Avenue, Kansas City, Mo.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.
WM. MORRIS, Las Animas, Col.

FOR SALE. Extracted honey, from alfalfa, at 7¢ per pound. Send for sample.
D. S. JENKINS, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7¢, in kegs and cans.
DR. C. L. PARKER
Sta. A, R. F. D., Syracuse, N. Y.

Satisfied Customers,

and their numerous expressions of the superiority of my queens warrant me in continuing the arrangement of my queen apiaries in 1902 as in 1901. I have watched carefully, and have selected the queens whose colonies gave me the best results in HONEY, for my queen and drone mothers.

Yard No. 1 consists of a combination of the **Root Long-Tongued Clover Stock**, the **Superior Stock** so much Advertised by Hutchinson, and a **Selection of My Own Stock** that I have been Breeding for years, in regard to which I have the following:

Buffalo, N. Y., Aug. 31, 1901.

My Dear Victor:—Queen and nucleus arrived safely yesterday; made entrance to nucleus and allowed them to fly yesterday. Transferred them to a Dovetailed hive this morning, *without smoke, and handled them, patting them on the back*, and I never saw such quiet and docile bees. If their working qualities are as superior as their handling, I am prepared to say you have the best bees I have ever met with, which would include some 25 or 30 different breeders, and all the well-known races.

Yours very truly,

OREL L. HERSHISER.

The colony of one of the queens I have selected for a breeder in this yard gathered right about 400 pounds of honey last season. I have not measured her bees' tongues, but they are ALL RIGHT, LONG OR SHORT.

Yard No. 2 consists of imported Italians, daughters and granddaughters. For further description see ad. later. Testimonials on application.

Yard No. 3—GOLDEN BEAUTIES or 5-banded Italians.

I am now booking orders for spring delivery; first come first served.

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

HONEY QUEENS!

Laws' Long-tongue Leather Queens.

Laws' Improved Golden Queens.

Laws' Holy Land Queens.

Laws' queens are the standard-bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four apiaries. Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

I. J. Stringham, 105 Park Place, New York City.

Honey-jars.

1-pound square jars \$5 per gross; No. 25 jar, porcelain top, \$6 per gross; Nickel-cap jar, fancy, \$5.50 per gross. All are clear flint glass. Discount on quantities. We ship from New York City, N. Y. **LABELS**, 60 cents per gross. A full line of Apiarian Supplies always in stock. Catalog free. Apiaries are located at Glen Cove, Long Island, New York. : : : : :

VOL. XXX.

FEB. 15, 1902.

No. 4.

MR. EDITOR, if any one should ask me whether that bee-cellar, so nicely described p. 98, is in Canada or California, what shall I tell him? [The address was left off by mistake. It should have been Tisch Mills, Wis.—ED.]

BASSWOOD for top-bars, says Niver, p. 95. Say, Niver, "in this locality" if you should put a basswood top-bar in a hive and then go fishing, when you got back you'd find that top-bar had warped and twisted clear out of the hive, and was crawling all over the bee-yard.

PROF. HARRISON, of Ontario, thinks drugs that will not cure foul brood in this country may do so in Europe, because bees there are to a greater extent immune to the disease. It is interesting to know that he reports success in disinfecting foul-broody combs with formalin. [I do not understand why European bees should be more immune to disease than American.—ED.]

THROUGH THE kind offices of my good friend M. Bertrand, Editor *Revue Internationale*, whom I thank heartily, thorough efforts have been made to obtain seed of the new white clover, *Colossal Ladino*, but without avail. One house furnished seed which proved to be that of melilot. Another expressed the belief that an old sort, trefle de Lodi, was meant. The strong probability seems to be that *Colossal Ladino* is a colossal humbug. [See Pickings.—ED.]

OUR FOREIGN FRIENDS are still having a time with American long-tongued bees. *Leipziger Bztg.* is quoted in *Le Progres Apicole* as mentioning \$400 American queens. That's up. ["Behold, how great a matter a little fire kindleth!" A while ago our European cousins were talking about our selling \$200 queens by the dozens; and now they have got them up to \$400 apiece! Some of those translators of American exchanges would do well to study

English a little more. Or perhaps they misunderstood the equivalent of our money.—ED.]

IRRIGATION talk in last number reminds me of my little nephew. He had never been outside of Colorado till he came to Maren-go, and when he saw so many trees here he asked, "Who irrigates all these trees?" [I do not wonder that a boy who was brought up in Colorado should ask such a question. And yet, after all, is there any class of people in the world who are more observing or fuller of questions than sons of their dads? Whenever I take my son out to see the world, he sees things I never thought of noting, and asks questions—well, just like all boys.—ED.]

G. M. DOOLITTLE, in *Review*, speaks of "giving the combs that watery appearance peculiar to most of the imported Italian stock." I have had a number of imported Italian queens, and I have not observed that peculiarity with any of them. The question is, whether my experience or that of friend Doolittle is exceptional. [Our experience has been much like Dr. Miller's. The leather-colored strains, especially the imported, would cap their honey whiter than the average of the yellow bees, although I will acknowledge that Mr. Doolittle once showed me some very white honey that his five-banded bees produced.—ED.]

THERE'S FOUL BROOD in your mouth, according to Dr. A. W. Smyth, in the *Irish Bee Journal*. He says: "Woodhead states on the authority of Vignal that the *Bacillus alvei* is an inhabitant of the human mouth—that great home of the bacteria where Leuwenhoek first discovered them." If that is true, it is worth while to look out about where our saliva goes when working with bees. [This is possibly true. Something over twenty years ago, when I was spending so much time with a microscope, I found there was a large variety of bacteria in my own mouth. If we only knew what foul places our mouths are, and if we could see some of the forms of microscopic life that grow there, we could not doubt that it might be a favorable place for the lodgment of certain disease germs.—ED.]

DO HENS eat bees? Dr. Sonder answers in *Centralblatt*, "Yes and no." He had an apiary in which hens had free run, and they never touched a living worker. He had another apiary in which the hens gobbled workers as fast as they settled. In the latter case the hens were closely confined, with little chance to get worms or insect food. [Some years ago we had evidence from a number of our subscribers, showing that chickens, when they once learn the trick, will gobble up workers in a wholesale fashion; but as a general thing they will not touch them, so I think Dr. Sonder's "yes and no" is strictly correct.—ED.]

RAUSCHENFELS thinks that on one trip a bee visits from 50 to 1000 flowers. One bee made 640 visits before he lost sight of it. So says *Le Progres Apicole*. [Rauschenfels must be exceedingly agile and nimble of feet, and of quick eye, to keep track of one bee long enough for it to make 640 visits. I have tried it in clover-fields; but after one had visited about half a dozen heads it would strike clear off across the field, just as we used to do when we went berrying. We would pick a little here, and then conclude it was better picking over across the field, and so we would move to the other point. It must have been exceedingly "good picking" for that one bee to have made 640 visits to enable one man to keep his eye on it all the time.—ED.]

NO WORSE THING than a wire nail for spacer to catch in the pocket of the extractor, says H. E. J.; p. 111. Just exactly what I thought till I tried it, and then I found it worked exactly as if no wire nail were there. The wire cloth in my extractor has 9 meshes to the inch. But say, H. E. J., even if it wouldn't work for extracting, you hardly ought to deny so good a thing to those of us who don't care about extracting. [Somewhere on my last trip, I can not just remember where nor when, serious objection was made to the use of nails on extracting-combs for spacers just because they did interfere in practice, as well as in theory, with putting in and removing from the extracting-pockets; so it seems the objection—at least with some—is more than theoretical.—ED.]

REFERRING to Stenog's comments, p. 93, I may say that I think R. Hamlyn-Harris has for some time been in Germany, and so, like most of the Germans, his entire horizon is filled by Dzierzon. Judging from the German bee-journals, I should suppose that the greater part of German bee-keepers idolize Dzierzon, and don't know that such a man as Langstroth ever lived. American bee-keepers even up matters by ignoring the fact that Dzierzon invented movable combs (not frames) without having heard of Langstroth's invention and that it is to Dzierzon and not to Langstroth that German bee-keepers owe most. Intelligence is not all on one side—nor ignorance. [This, it seems to me, is a very fair state-

ment, giving full credit both to Dzierzon and to Langstroth. But did Dzierzon really invent movable combs? and was it not Langstroth, beyond all doubt, who gave us the first practical movable frames?—ED.]

G. THIBAUT says in *L'Apiculteur* that, although Prof. Gillett's experiments showed that drone comb was heavier than an equal volume of worker comb, new verifications upon hundreds of combs have shown him that drone comb is only $\frac{23}{100}$ as heavy as worker. [This new figure of later investigation seems a little strange. A few years ago, when we were making some measurements and experiments in this matter, we found that drone comb, as a rule, for a given amount of surface and cubic capacity, was heavier than worker—very much heavier; and when Prof. Gillette, later on, fully confirmed our results, it seemed to us the question was settled. Our readers will remember that we showed cross-sections of worker and drone combs, and that the cell walls of the former were very much more delicate than the latter. Perhaps it is a question of locality.—ED.]

A COLORADO sun-proof and rain-proof cover, described by M. A. Gill, in *Review*, is covered with a heavy coat of oxide of zinc and lead paint; upon this paint, while still fresh, is laid *thin* unbleached muslin, and immediately a heavy coat of the same paint is laid on the muslin, and another coat when dry. [I asked Mr. Calvert to figure on the cost of Neponset paper and unbleached muslin for hive-covers. After figuring a little he surprised me by saying the muslin cost only about half as much. My impression is that I should prefer it, even if it were twice as expensive as paper, because, treated as Mr. Gill recommends, it would certainly be very durable. If the paint be first applied to the cover, then cloth be laid upon it while the paint is green, it forms a bond of union with the wood. Now, then, if he covers it with another coat on the outside, it is rendered impervious to water, and stiff and hard. I suggest that the readers of GLEANINGS test paper and muslin side by side. Let us see which will stand the most "grief" in different localities.—ED.]

AN INEXPENSIVE apifuge (is it as good as inexpensive?) is given in *Revue Int.* Take 2 parts vaseline to 1 of naphthaline. Melt the vaseline with mild heat, then mix in the finely powdered naphthaline. The writer says he rubbed his hands with the mixture, and visited 28 colonies without getting a sting, while the bees attacked furiously a veiled and gloved assistant. [The recipe for apifuge may be all right; but I tried the article put out by Mr. Grimshaw, of England, some twelve years ago. If the hands were bathed in the liquid, and moved cautiously up to the bees, they would retreat to a certain extent. But I found it was entirely ineffective in the case of a sudden onslaught from one or a dozen bees. It is this kind of attack that nothing

will ward off, and the ones we have to fear. The hovering or flying bees will very seldom sting. It is the bee or two that stand up high on their legs, twist nervously this way and that, and finally make a sudden dart—zip-ker-whiz-z-z-ping—that will sting any thing in sight—rush into a smoker when the smoker is red-hot—yes, and try to sting the barrel itself, and finally writhe in agony on the hot metal before it will give up. No, I would not give much for any preparation in the way of apifuge as a preventive of stings to the bare hands when such bees are on the war-path.—Ed.]

“DRUNKENNESS is far more common in the United Kingdom than it is in the United States, and all the difference, apparently, is due to the difference in the consumption of beer alone. Can we argue, then, as is sometimes done, that beer is a promoter of sobriety?”—*Chicago Record-Herald*. [The very fact that beer contains a comparatively small percentage of alcohol makes it the most harmful alcoholic beverage known, I believe. Pure whisky or pure brandy, containing six or seven times as much alcohol, I have been told, is not nearly as harmful. The real danger from the cigarette is not because it may be drugged, but because it contains a very small quantity of light tobacco—so small an amount that the fumes of the smoke *can be inhaled in the lungs*, while the fumes of the cigar are too strong for that purpose. The effect of the cigarette is ten times more stupefying than that of a cigar, for that reason. Beer, from its small amount of alcohol, does not intoxicate unless a considerable amount is taken. It is the *quantity* that does the mischief. It is the malt liquors, of which beer and ale are the most common representatives, which are the most harmful in their general effects. Although the Filipinos used stronger alcoholic drinks up to the time of American occupation, yet when American *beer* was introduced, drunkenness increased at an appalling rate. I am ferninst all kinds of alcoholic beverages—and particularly so am I against beer, and I will vote for any measure or proposition that, in my judgment, will do the liquor business as a whole the most harm. When I know, for instance, that certain proposed legislation makes its devotees howl with rage, that is the measure that ought to pass. *They* know what will hurt every time.—Ed.]

B. P., N. Y.—The locality for bee-keeping within ten miles of San Francisco is not good; but by going into the central part of the State 60 or 100 miles southeast, along the line of the railroad, some good places are found. But they are pretty well taken up, and you could not very well get into them without buying some one out. The locality on the coast south of San Francisco, or north of it, would not be desirable. There are some good locations a little northeast of San Francisco, about 100 miles.

And perhaps the time is coming
When the losses we've sustained
Will be counted greater profit
Than the riches we have gained.

After the Straw relative to *Colossal Ladino* had gone to press we received a card from Dr. Miller telling us to withdraw it. I had just translated Mr. Bertrand's letter to Dr. Miller, wherein it was stated that the plant in question was probably a fake, and not to be found. Dr. Miller's reason for canceling his Straw was a letter from Mr. Bertrand stating that he had secured some ladino seed, and it now appears that what was thought to be a myth is at least a reality if not a benefit.

AMERICAN BEE-KEEPER.

A very important change has taken place in this journal. Instead of being published at Jamestown, N. Y., it is issued at Fort Pierce, Fla., the residence of the editor, Mr. Harry Hill. The difficulty of editing a paper at long range must be very great, and this, probably, accounts for the change. Another striking feature is the insertion of six pages of reading-matter in the Spanish language, for the benefit of Cuban readers. In the February issue will be found the beginning of the natural history of the bee, in Spanish. The Spanish seems to have been put in type by those who do not understand that language.

In speaking of the trouble that besets the market in extracted honey, W. W. McNeal says that only about a half of one per cent of our people believe that extracted honey can be obtained in a state of purity. While giving the glucose-mixer due credit for his bad work, he says one thing that ought to be remembered:

Now, bad as glucose may be, the germ that is sapping the life of trade in honey finds its abiding-place in unscrupulous methods of production. To people of taste and refinement the quality and general appearance of extracted honey in so many instances reflects on the producer such slovenly habits as to be in reality reprehensible.

The man who produces thin, unripe, unstrained, or dirty honey, and palms it off on another is just as deserving of censure as one who puts in glucose and calls it honey. The effects are the same in both cases, for both rob honey of its rightful constituents.

Referring to the comb-honey canards, and the difficulty of convincing some editors of the facts in the case, the editor well says:

There is also another class of editors with whom we have to deal—their numbers are few, let us be thankful—who assume to have personal knowledge of the existence of such spurious products, and are therefore unwilling to be instructed on the subject. We have on several occasions, when endeavoring to impart the real truth of the matter, succeeded in eliciting only the sympathy of our misinformed enemy.

BRITISH BEE JOURNAL.

John H. Hocking, in a defense of the wasp, quotes Sir John Lubbock as saying that he counted one wasp making 94 visits to some honey in one day, the honey being given for that purpose. After speaking about the ceaseless warfare wasps wage on our common flies, the writer draws this satisfactory deduction in favor of Miss Wasp:

To a nest, say 2000 workers in their daily visits are carrying some 198,000 excremented pilferers and tormentors, or, to 100 nests, in a radius of two miles, are carrying 19,800,000 a day. Think of life without this protection! This number will allow, if you please, a liberal discount without ruining the plea. We have a keen perception, and so has the saw, of what the destruction of hawks, owls, weasels, and other adjusters of the balance of power in Nature has done. Who can picture the results attending the extinction of the wasp family? Shall they not be welcome to a share of our fruits, and may not an occasional sting be borne with patience, when we remember our comparative freedom from the irritating attacks of other insects?

I am the more glad to learn this, for I have always had a liking for wasps on general grounds, they being our first paper-makers. In our old readers is a poem representing a conversation between a bee and a wasp, wherein the latter asks the bee why she is much more liked by people than she, the wasp, was. The answer was to the effect that wasps are always stinging, like fault-finders, while bees are always doing something useful. Man is learning that many of his supposed enemies, such as wasps, snakes, owls, woodpeckers, hawks, etc., are his very best friends. I believe Prof. Cook has done much in furtherance of this humane view of the case.

BEES DON'T WORK BY RULE.

"I am a beginner in bee-keeping, and have been reading all I can get hold of pertaining to bee culture. I find much of your writings in the bee-papers, and much you say seems right and good to me. Still the teachings you give do not harmonize with those given by other writers. On the contrary, they seem at times to be almost directly opposite and these other writers do not agree with each other any more than they agree with you. I have looked in vain for some one person whom I could follow with a certainty of success, and as freely as I would a teacher in arithmetic or other common branches of study. How am I to know what to do?"

"But a rule in arithmetic and a rule in bee-keeping are two different things. Twice two makes four every time, because it can not be otherwise, no matter by whom multiplied, nor at what season of the year the computation is made, nor in what locality it is done; hence we have the rule of

multiplication as being always the same. The same of addition, subtraction, etc.; but when we come to apply any rule, similar to the above, to the bees, we find it doesn't work, for the reason that every season brings its changes, and each locality has a different bearing on the subject."

"But don't you think that many beginners are puzzled in these matters, similar to what I have been?"

"I presume there may be, for I have known of even older persons in our ranks who said they could not tell just what to do from what they read; and so, if you desire, I will try to explain a little to help you out."

"That is just what I wish you to do."

"Very well. Let us take the matter of early pollen as the first. Many advise feeding corn, oat or rye meal as a substitute for pollen, early in the season, while others say such a course is useless and an absolute waste of time, trouble, and material, and that it results in the loss of numerous bees on cold and windy days, by their being enticed out of the hive when they'd better remain at home."

"Yes; that is one of the very items of disagreement which I noticed. How do you account for these different opinions?"

"The matter of location will account for this matter. The party advising the meal feed lives in a locality where pollen from the flowers is not obtainable till late in the spring, so his bees are slow in building up unless meal of some kind is fed, while the one who opposes such feeding lives in a location where pollen-bearing flowers bloom nearly if not quite as soon as the bees can fly in the spring, and the feeding of meal in such as this latter locality is, as is said, wasted."

"Would you feed meal if you lived in the location of the first?"

"Ten years ago I would have said yes, and I would do so now did I not have combs with pollen in them. Of late years I have been in the habit of setting away combs during the summer, which I found heavy with pollen, through some colony being queenless or otherwise, and keeping these to set in any colony (one in each colony) which I might find not having plenty of pollen on the first opening of the hive in spring. Such a course seems to have a better effect on the colony than feeding meal, and is nearly if not quite equal to the bees securing early pollen from the fields, and that without the loss of bees, which very often happens where pollen from the flowers is sought after in cool, cloudy, and windy days."

"But how do you keep the moths from ruining these combs? I read that there is nothing which suits the larva of the wax-moth better than combs having pollen in them."

"These combs containing pollen are placed in an upper story over a weak colony, or a strong nucleus will answer just as well, for it takes but a small colony of Ital-

ian bees to protect a score or two of combs from the ravages of the wax-moth."

"But we are digressing. Some say I should put on the sections for surplus honey early, while others say they should not be put on till after swarming. How do you reconcile this?"

Here each has a different idea in view. The first wishes to discourage increase as much as possible, while the latter wishes increase, and so says wait till after swarming, so that he may be sure of all the increase possible. All practical bee-keepers know that, while the early putting-on of sections will not entirely prevent swarming, it will check it to some extent; but more especially it tends toward swarms issuing later in the season."

"Then there are a thousand and one different ways of introducing queens, each claiming his as infallible, while the others say all are liable to fail except the particular plan advised by him. What about this?"

"This reminds me of what occurred some years ago, when, in our basswood flow, I found I could introduce queens by letting them run in at the entrance just at night, the old queen having been removed during the forenoon; and as I did not lose a single queen out of scores so tried, I set it down as a rule that queens could be thus introduced safely every time. Now, thought I, here is a common-sense rule that will apply to bees as the rule of multiplication applies to the multiplication-table; but when I came to use it after the basswood harvest was over I found it did not work with two queens out of three. This said the *season* of the year was the controlling factor in the matter. At the time I was having such success I wrote to a friend living in New Jersey, where there was no basswood, in reply to a question on this subject, how he could safely introduce queens by this plan; and although he used it at the same time of the year, he lost every one he tried, owing to his being in a different locality which gave a different honey-flow. Undoubtedly he wished that Mr. Doolittle had told him something which he could follow with a certainty of success."

"Do you think that the season and the locality was what made the difference?"

"I can only think that the reason why he failed was because all things were not in the same condition in his locality that they were in mine when I was having success; for, when there came a change in the conditions existing in my own apiary, I also failed, and I doubt if those exact conditions will ever come to my apiary again. And from these examples given, you can, I think, see why no rule regarding bee culture can be formed which will do to follow throughout the world as can the rules of arithmetic."

"This being the case, how can I or any other beginner know what to do?"

"The only thing we can do is to try the plans of others (or even our own plans) cautiously till we know they are suited to

our wants, using charity all the time, for there is a great difference in persons. Some experiment carefully, proving every thing critically, step by step, as they go, arriving at almost a definite conclusion with the first experiment; while others experiment in such a slipshod manner that their experiments at the end of several years are of little value. Yet, notwithstanding all of these drawbacks, the careful reader of the many articles on bees found in our literature of to-day will find much of value after he has sifted the chaff from the wheat. One hundred dollars per year would not hire me to cease from reading on this subject, for it is to this reading that I owe nearly all the knowledge I possess relative to bee-keeping."

I THINK we never had so much good copy on hand before as now. Some articles that we have been trying to get in the "very next issue" have been lying on the galleys for two months, and they are good articles too. We have been printing eight extra pages, and ere long will issue a double number to catch up.

IN referring to Prof. Frank Benton, in our Jan. 1st issue, page 16, I spoke of him in one place as "the entomologist." Prof. Benton has called my attention to the fact that this language might mean Dr. Howard, the head of the Division of Entomology. He explains that, at that time, he was one of the *assistant* entomologists, and the omission of the adjective might refer to his chief.

IN our April 15th issue for last year, p. 335, Mr. R. C. Aikin, of Loveland, Colo., described his non-swarming method, and then requested others to test it. It worked satisfactorily for Mr. Aikin, and in my footnote I stated that it embodied some features in a plan that I had tried with some success. Mr. Aikin wishes to know now whether any one did try it, and, if so, he would like to hear from the parties through our columns.

THE SALISBURY METHOD OF GLASSING SHIPPING-CASES.

IN our last issue, page 58, I spoke of the advantages of using small squares of glass, in place of the long large pieces, for shipping-cases. I have just learned that some of the honey that took the first prize at the Pan-American was put up in cases having the small lights and wooden buttons. To my notion, the new method of glazing comb honey gives a far better appearance than the old, and it has the advantage that one can do his own glassing from material he can get around home, almost for the asking.

JUST as we go to press I have only room to mention the appearance of the *Lone Star Apiarist*, Vol. I. No. 1, published by the Lone Star Publishing Co., Floresville, Texas, and edited by Louis Scholl. Mr. S. is one of the young men I met in Texas. He is a whole-souled good fellow, a progressive and up-to-date bee-keeper, who has got the making of a good editor. We extend our heartiest welcome, and wish them every success. The paper presents a very creditable appearance.

APICULTURE NOW RECOGNIZED BY THE UNITED STATES GOVERNMENT.

OUR readers will be pleased to know that the United States government has given apiculture an actual recognition by creating a special commission, that of Apicultural Investigator in the Department of Agriculture. The man who has been advanced to this position is Prof. Frank Benton, who formerly was Assistant Entomologist in the Division of Entomology. This position he held from 1896 to August 1, 1901, when the new commission was created.

Prof. Benton has been doing some good work in the vigorous way in which he replies to these comb-honey canards that have been published in various papers. I have taken pains to ask the editors of all papers giving circulation to these lies to write to the Department of Agriculture, adding that there was a man in the employ of the Department who made apiculture his specialty, and who could give full information, and it is evident the suggestion in some cases has been heeded.

No one can really estimate the good this new commission has done us already.

PROPORTION OF ACID TO WATER IN WAX-REFINING.

A CORRESPONDENT has stated that I said somewhere in GLEANINGS (he does not say where) that the proportion of acid to water in refining wax was anywhere from 5 to 25 per cent. I do not see what I could have been thinking about, for that is very wide of the mark. The A B C of Bee Culture (and I wrote the item) says 1 per cent, and that is about right. It is our daily practice in refining the commercial product as we buy it, to use half a gallon of raw acid to two barrels (60 gallons) of water. This would be a little less than 1 per cent of acid to water. If the wax is very dark we make a slight increase. Very light wax would require less than half a gallon. In refining commercial wax, anywhere from $\frac{1}{2}$ to $1\frac{1}{2}$ per cent of acid may be used; but in the handling of old dark combs, especially slumgum, it will be necessary to increase the amount to perhaps 2 per cent; but in that case it would be better to render the wax again in clean water so as to get out the slight traces of acid or acid smell. The $\frac{3}{4}$ or one per cent solution of acid never leaves any trace, so far as we can discover, in the wax.

THOSE BEES UNDER THE MACHINE-SHOP.

I HAVE seen bees in many different cellars; I have read a good deal about wintering; but I think I never knew what perfect indoor or cellar wintering was before. Those 250—now practically 300—colonies under the machine-shop in a compartment done off by themselves are doing finely. The cellar floor is dry; the air is sweet, and the bees can scarcely be disturbed by turning on a strong electric light. This morning I stayed in the cellar five minutes before a single bee flew out. Then one vigorous thrifty fellow struck for the light, apparently just as healthy and strong as any bee in the height of the honey-flow. True, there are some dead bees, but the number is small.

The temperature this winter has not varied as much as last, and that may have had a great deal to do with the splendid results. This morning, Feb. 11, the mercury stood exactly at 45. It goes down to 40, and up as high as 50. The weather has been snug and cold outside, and therefore it has been possible for us to control the temperature; but with good fresh air I should not expect to see many dead bees with even a temperature of 60.

THE SCRAMBLE WESTWARD; A FEW WORDS OF CAUTION; THE BEE-KEEPING HOG; BEE-KEEPING IN THE WEST.

IN my general write-ups among our friends of the craft on our southern and western borders I have tried to tell the exact truth, the bad as well as the good things. Recently I have been informed that bee-keepers are rushing into Idaho from the mere reference that I made to the fact that it is a splendid country. One man has not only located there in a locality already overstocked with bees, but has brought hundreds of colonies from the East with *foul brood*; and when upbraided by a fellow bee-keeper for his folly he simply laughed and said, "The foul brood I brought will soon clean out the fence-corner apiaries, and then I'll have room enough." I can not think of language strong enough to condemn such a—such a—well, yes, a hog as that. He would like to have all the territory to himself, even if he brings calamity upon his brother, who has a prior right to the field. I assume, of course, that, while there is one man such as I have described, there are hundreds of others who are fair and honorable.

But let me put in a word of caution. Do not rush into a field with a lot of bees until you have first written to learn something about the conditions. If you will write me I will give you the address of some beekeepers in the vicinity. Learn all you can by writing, then go yourself in person, but without bees. Look the field all over, and when you decide on your locality, go into some place where there are no bees, or buy out some one who is in the field. I should be exceedingly sorry to know that my writings result in a foolish scramble into localities already overcrowded.

Now, while I have tried to tell the bad things about some portions of the West, I wish to say that I did not see all the dark side, and therefore I can not tell about it.

While thousands of tons of honey are produced in the West, yet there are certain drawbacks. As I have before pointed out, lands that have been wonderfully productive, and where there is plenty of water, are now barren wastes. The two principal causes of this are a shortage of water, and alkali forced from the lower sub-soil up to the surface by the water of irrigation, leaving the land barren as if it had been whitewashed. Alkali kills off nearly every form of profitable vegetation; and the only things that will then grow are certain kinds of alkali weeds. In some cases sweet clover will thrive. I found hundreds of acres of this on alkali land that had been abandoned in the western part of Colorado. So bear in mind that one may locate on good land, and think he is going to make a fortune; but, lo and behold! alkali, the dread enemy of the irrigator, may come to the surface, and then all is up. I went through one town, or what had once been a town, that was literally deserted. The houses, stores—in fact, every thing in sight, including the railroad depot, was put on wheels and pulled off from the alkali stretch. You can imagine what kind of hardship such moving puts on the people.

There are some localities in Texas that have produced enormous crops of honey, but yet which are subject to drouth. Possibly they may be irrigated in time, but generally there is sufficient rain to take care of growing crops. And California, the land flowing with honey, has too many off years to be a great bonanza to the bee-keeper.

He who thinks of going west should remember that, while thousands have bettered their condition, there are very many who have sunk every dollar they had, and have gone back east, sadder and wiser men. If one happens to get into a good locality, has ordinary business sense, and is honest, he will do well. But he may locate on an alkali piece, he may get into the hands of a land shark, or he may happen to strike a locality usually productive, but sometimes visited by an awful drouth. Farmers in Kansas and Nebraska know something of what this means.

Taking it all in all, I hope my friends who follow me through my trip in the West will take the pains to write before jumping over into any locality blindly. If I can not give you the full particulars and all the facts I can refer you to some others who will tell you the truth. Many of the best locations in the United States are now already overstocked; and the bee-keeper who will go into a good location and establish an apiary right by the side of one who has been in the place for years—I do not like to say it, but he comes pretty near being a h-o-g.

LIES ABOUT MANUFACTURED HONEY; THE EFFECT OF THE RECENT BOMBARDMENT.

The continuous stream of letter-writing that bee-keepers have been keeping up in response to the requests from the editors of bee-journals is beginning to have a telling effect. The result is, that many of the best agricultural papers as well as some of the leading dailies have published the truth concerning comb honey; and so far all but three of the papers that gave space to the lies in the first place have either retracted editorially or else have published the statement from some bee-keeper, utterly refuting the nonsense that appeared in their columns. Among the papers that have finally yielded to the pressure of hundreds and perhaps thousands of letters is the Chicago *Tribune*, the paper that started these canards in the first place, and which has persistently refused to publish any thing since in the way of retraction. Thinking that a prophet is not without honor save in his own country I wrote to E. H. Schaeffle, of Murphys, Cal., asking him if he could not take a hand in helping us out. Among the first papers he tackled was this same Chicago *Tribune*. He wrote them a strong article, and they published his letter in full under a heading that it put on itself, in good strong head-lines—

"COMB HONEY IS NOT IMITATED."

And this is not all. You will no doubt remember that Commissioner Jones, of the Pure-food Commission, Chicago, was reported to have said by this same Chicago *Tribune* that there was very little pure comb honey on the market in Chicago—that it was nearly all manufactured, and that the bogus could be readily detected from the genuine by the fact that the former was white, while the latter was dark with dark circles around its eyes, so to speak. For a long time Commissioner Jones seems to have kept silent; but finally Editor Abbott, of the *Modern Farmer and Busy Bee*, wrote to him and received from Mr. Jones a letter, very emphatically stating that he had been misquoted; that he knew as well as any one that honey-comb could not be manufactured and filled with glucose. I should like to place it before our readers, but I have mislaid the copy. At all events, the whole foundation of these comb-honey lies that have been so persistently circulated is crumbling to dust. Commissioner Jones has been quoted far and wide. The Chicago *Tribune* refused to retract; but, thanks to the persistency of bee-keepers and editors (we like some glory ourselves), the lies are being nailed, and the truth is being spread broadcast.

The *National Stockman and Farmer*, at Pittsburg, Pa., a paper of wide influence, published the usual stuff about comb honey. This paper was immediately bombarded, with the result that it published a retraction; but among the bomb-throwers was

Dr. Miller; and I have just learned that the *Stockman* has published his article in full, in addition to the previous retraction.

Editor York, of the *American Bee Journal*; Editor Abbott, of the *Modern Farm and Busy Bee*; Editor Hutchinson, of the *Review*; Editor Hill, of the *American Bee-keeper*, one and all, have been taking a hand in this.

But one of the most important articles that has been so far published was one by our Mr. W. P. Root, the man who is almost constantly at my elbow. His brother is publisher of the *American Grocer*, New York, undoubtedly the leading paper of the trade, and of course goes to all the principal and progressive grocers in the country. This article, in the Feb. 6 issue, with certain illustrations supplied from this office, not only tells how comb honey is produced by the bees, but shows conclusively that it can not be manufactured. This, going as it does to all the grocery trade, just now is of immense importance, for it will enable the grocers to tell their consumers (just the people we want to reach) that comb honey is not and can not be manufactured, and why.

There are two or three papers that have not yet retracted, so far as I know. A department editor of the *Des Moines Homestead*, under the *nom de plume* of *Practical Farmer*, put out a statement some time ago to the effect that comb honey was manufactured; then when he got a bombardment from bee-keepers he modified his statement in a subsequent issue by saying that he had kept bees for twenty years; but that he had "bought both extracted and comb honey, and found both to be adulterated. . . . Comb honey is not so readily adulterated, but it is possible to do this. The bee-keeper has to help do the mixing when comb honey is adulterated; and I am not going to say how it is done." Our friend professes to know, and insinuates that bee-keepers have a part in this nefarious business. That's a slander on the business and the men in it. As to "how it is done" he has probably got the idea into his head that glucose can be fed to bees so they will store it in the comb. If any one undertakes to do a thing of that kind he will find it is exceedingly unprofitable. The fact is, *Practical Farmer* does not know what he is talking about; and I hope our readers will bombard the *Des Moines Homestead* in such a substantial way that the editor of that paper will conclude that he has got into a bees' nest. I have already written to the editor of that paper, but no attention has been paid to my letter. It is evident that the *Homestead* will have to be given a dose of letter-writing such as the *Chicago Tribune* and other papers have received of late; so, brother bee-keepers, you know what to do.

Now, no one should suppose that the battle we have been waging is won. The general public are much more ready to believe sensational lies than sober and tame truth.

The lies have found lodgment, and I venture to say that the great mass of consumers still believe that comb honey is manufactured. What we need to do is to start out on a campaign of education. That means that every bee-keeper who has a little "pull" or influence with any particular paper is requested to write a short clean-cut item about comb honey. It should be interesting as well as a simple narration of facts. When possible, put the article in typewriting. When that can not be done, if you can not write a good clear hand then get your wife or daughter or your best girl to copy your article. Let us flood the papers with facts. There is no more important work that bee-keepers can do for themselves than this, and it should be done right now.

As an illustration of what bee-keepers can do in the way of getting articles published in the papers that have not slandered the comb-honey business, I give a bright pithy paragraph from Mr. W. E. Head, in the *Utica Press*, published in Utica, N. Y., a paper of considerable influence and circulation. Mr. Head says:

ABOUT THE BEE BUSINESS.

To the Editor of the *Utica Daily Press*:

An article is going the rounds of the press that by all means should be corrected. It relates to bogus comb honey. It is a well-known fact that extracted honey is sometimes adulterated, but the National Bee-keepers' Association works hard to maintain the purity of such honey. But when some persons start the story of bogus comb honey, and furthermore state that The A. I. Root Co., of Medina, O., who are the largest manufacturers of bee-hives in the world, have been for some time manufacturing bogus comb and filling the same with glucose, I say that such is not the case, as there are no stronger workers for the bee-man's rights than E. R. and A. I. Root. When a person brings a single pound of artificial comb honey that can not be told from the genuine, then the Root company will pay that person a note of \$1,000, and I will indorse the note. If such dies were made to stamp comb, then all combs would look just alike. To the grocers of Utica who deal in comb honey I will pay \$10 for two one-pound sections of honey that look just alike. Of all the leaves on our trees, no two are alike. Let me advise those who intend going to work making counterfeit comb honey that they'd better change their dies to make \$10 bills. They would be much easier to counterfeit and a great deal easier to pass.

Paris Station, Jan. 14, 1902.

W. E. HEAD

"A COMB-HONEY FACTORY."

Mr. Head, in sending this to us, very properly remarked that "a stitch in time saves nine," and then adds that he takes pleasure in sending a photo of the *only* "factory" where comb honey is made. The picture, he says, was taken while the "workmen" were "in front of the main entrance."

It is a "factory," and no mistake. It represents a bee-hive with the bees flying around at the entrance, apparently busy at work in and out of their "factory." In the upper right-hand corner Mr. Head pastes a cut of a queen-bee, and dubs her "Mrs. Q. Bee, General Manager and President."

I wish to refer particularly to the excellent statement made by Mr. Head for the *Utica Press*. There is no immediate probability now that that paper will help pass around the usual lie.

BEE AND HONEY TRUSTS.

The Right and Wrong Kind; the Rambler is Indignant.

BY J. H. MARTIN.

Mr. Editor:—I have just received GLEANINGS for Jan. 15, and feel like making a few comments upon companies, trusts, exchanges, etc.

In the first place, I do not like it a little bit that the ideas respecting a honey company, as outlined in the last Ramble, should be classed with any little local California affair, as classed as a trust. If the plan outlined is a trust, then The A. I. Root Co. is a trust, and every combination of capital for the organization of a company to conduct business is a trust.

It seems to me to be a very simple matter for a few capitalists or even one capitalist to put money into bees and so locate and manage them as to secure a continuous honey crop.

There is one man, at least, who has risen to the higher possibilities of honey production. Since I came to Cuba I learn that Mr. W. L. Coggs shall is working on this line, having bees in New York, New Mexico, and Cuba, and is securing in a small way that continuous honey yield; or, if he is not, it is the fault of his selection of localities. It is further evident that, with good health and plenty of capital, he would greatly enlarge his business. Now, shall we write Mr. C., with his broad ideas, down as a trust, or class him alongside of that recent effort on the Pacific coast to form a honey company? or shall we class him as a sensible man with a sensible business proposition?

While we are about it, why not write down the California Citrus Fruit Exchange as a trust? that is a combination of many interests.

"Stenog" quotes approvingly, page 47, what Prof. Cook says upon that subject in the *American Bee Journal*.

I have an idea that your readers outside of California have only a vague idea about the Citrus Exchange and its success, and there is one very important point upon which Prof. Cook has failed to enlighten the public.

Let me escort you down Magnolia Avenue, Riverside, Cal. Here are orange-groves for miles. They are mostly in private holdings of five, ten, or twenty acres. Let us take the ten-acre orchard. It has been planted 20 years, and is in full bearing condition. There is a cottage almost hidden under the foliage of pepper-trees. The grounds are planted with a variety of roses and bright-hued flowers. Over the veranda

is a climbing vine. In scores of instances instead of a cottage it is a palatial residence. What do you suppose that ten acres with its cottage can be bought for? When I lived in Riverside a few years ago, \$10,000 would scarcely touch it, while in many instances the palatial residence itself cost double that amount. Now let us see who owns these groves.

Here is a house and grounds showing esthetic taste in every line. Prof. Slender resides here. He is from Boston. His health failed, and, with a good amount of capital in his pocket, he has found health and profit in a California orange-grove. His neighbor is ex-banker Strong. His wife's health led him into orange-growing. A little further down the avenue is Dr. Herrick. He lives in a palatial residence, and has large moneyed interests. Here is an ex-governor from an eastern State; many ex-congressmen, ex-senators, and, out in Glendale, is Judge Ross, with a national reputation. They are all much interested in orange-growing. They are the class of men who give backbone to the Citrus Exchange. They are the cream of the business, and professional men of the East. With their capital and business acumen they have an immense uplifting power. You would think that such men could organize a successful citrus exchange upon the first trial. But such is not the case. The Exchange of to-day has come up through various trials and failures, and even now it does not control all of the orange-growers; but there is enough to make the Exchange measurably successful.

Let us now turn to the bee-keepers' side. Here is Sam Slop. He has an apiary of 200 colonies in Esq. Jenkins' canyon. Well—well, I have said enough along that line. I will carry the comparison no further. California bee-men all know how it is. While there are many good honest men and careful bee keepers, there are no quantities with great capital behind; or if recently they have entered the field, their number is so few as to have little bearing upon the industry. There are too many Sam Slops and not enough of an uplifting power; and if the Citrus Exchange has had a hard time arriving to its present estate, with all of its moneyed influence, what can we expect from such a weak, uncertain industry and personelle as the honey business?

Now, I understand that the trust promoted by the *Pacific Bee Journal* was pronounced impractical by a competent committee because it took in all the Sams with their body, breeches, and bees, and not much working capital, and in due time Sam's share would be all experience while the cash went to the other fellow. It confined its operations to one locality, and a very uncertain one at that.

A company according to the Rambler's plan has a wide field. There is no chance for failure at all points at once. Then the Sams are all eliminated. The plan is not

even co-operation, for one capitalist can run it as his own private affair.

I was going to say something severe about some editors of bee-journals and their obscure vision about a larger bee-keeping; but perhaps the editors are all right. The time is not just ripe for such things.

Well, the Rambler is now in Cuba. Some of us have had an idea that it is a larger honey country; but even Cuba has its undesirable features. I will soon endeavor to give you an impartial glimpse of bee-keeping here.

Havana, Cuba, Jan. 27.

EXAGGERATED HONEY REPORTS.

The Editor's Position Indorsed; Nominations; the Black-Brood Situation in New York.

BY P. H. ELWOOD.

Friend Root:—I have been wanting to write you for some time to compliment you on your famous editorial on that infamous attempt to bulldoze the bee-keepers of the United States into the belief that a large crop of honey had been secured the past season. I heartily indorse all you have said in condemnation. After two years of crop failure, the attempt to wrest from the bee-keeper the slight advantage he possessed in bare markets, moderate yield, etc., was indeed infamous. The animus of their attack you unveiled so perfectly that it leaves them in an undesirable but well-merited position. They do not want the truth known. A few years ago, when an honest intelligent effort was made under the direction of Mr. Knickerbocker to gather statistics of each honey crop in time for producers' use, this same class of people were for ever howling about the unreliability of our reports. Their efforts with our members were kept up until the reports were discontinued. I think the time is now ripe to make another effort to obtain honey-crop statistics, and I have felt for a long time that the government ought to engraft them into its crop reports. Our product is of sufficient importance to warrant it, and we are well organized into a National Association. Our able manager, Mr. Secor, is well qualified to work this through, and we could not expend a part or even the whole of the money in our treasury to better advantage. We must make a united effort to maintain living prices.

In regard to making nominations for Directors before election, why not let well enough alone? Our Association is doing well; but as soon as nominations are made there will arise the suspicion that some one or some clique is trying to run it. Better put up with some minor evils or inconveniences than to have our camp divided. The black-brood disease seems to have let up somewhat the past season; but whether from the extra honey-flow or whether in the microbic warfare the death-dealing microbes have met a new enemy we can not

tell. New York is well policed for this disease; but the original investigations, commenced so auspiciously under Dr. Howard, have been discontinued on account of a lack of funds. A more short-sighted, parsimonious, and unjust policy can not be imagined. We do not know how it spreads; but the popular idea is that it is carried in infected honey. A year ago last fall one of the best bee-keepers in this or any other State fed a lot of diseased colonies on honey taken from diseased colonies broken up. A lot of brood was raised in each hive, without a trace of disease, so stated by N. D. West, State Inspector, and others. It may be a kind of yellow fever among the bees, carried by a new kind of mosquito or some other insect. Some of our neighbors saw the disease among the bees on exhibition at the Pan-American. I had not supposed it had got so far west.

Starkville, N. Y., Dec. 27.

A PLEA FOR CANDIED HONEY.

Are we Making a Mistake in Putting Out so Much Extracted Honey in Liquid Form?

BY S. T. PETTIT.

I am painfully convinced that some of us are making a mistake in saying so much about putting liquid honey upon the markets. I fear the practice, for two reasons, has a tendency to a temptation, with some, to allow a little adulteration to slip in, and more as the years go by. And then the practice means quite an additional cost to the consumer, which will react prejudicially upon our small profits.

If we all would follow the simple easy way of allowing the honey to candy, as nature intended it to do, nearly everybody would, after a certain amount of education, prefer it candied, and that would save a world of trouble and expense. A few days ago a neighbor asked me, "Can I get another ten pounds of your dark fall honey?" I said, "Yes. Do you want it liquefied?" The answer was a decided: "Oh, no! we like it better solid. It doesn't have any strong taste when it is candied."

Mr. John Yoder, of Springfield, Ont., while visiting us yesterday, told me of filling an order for a pail of honey not long ago. He took a pail of liquid honey, and the lady said, "Oh! we don't want it that way. We like it hard;" so of course he took her a pail of candied honey.

I mention just these two instances of many to show the opportunity we are neglecting to our hurt.

Years ago, when I was younger, and liked to canvass for the sale of honey, and when I enjoyed delivering my own sweet product, some of my city dealers did a large business in selling candied honey. I would furnish it in 40-lb. covered pails, made for the purpose, and the dealer would cut it out and sell it in the same manner that tub butter and lard are sold. Indeed, sometimes early in the season I would hurry up

the candying process to help their trade. But the time came when I was obliged to go more slowly, and do less; so I decided, some years ago, to sell nearly all my output to a wholesale firm. It does seem to me that we are now in a down-grade movement in this liquefying business.

I know that many good men are now engaged in the process; but I feel sure that time will tell that they are making a mistake.

Aylmer W., Ont., Can.

[I am with you in believing that we ought to push candied honey more than we do, for it is a fact that rank honey, when candied, is a little nicer eating than when in the liquid state. On the same ground we should educate consumers to the fact that extracted honey put up by a bee-keeper is always pure—that is, I think we may state that, as a rule, no bee-keeper will adulterate, so I fear nothing on that score.—ED.]

LENGTH OF TONGUES OR LENGTH OF TONGUE REACH.

Prof. Gillette's Tables of Measurements Reviewed;
Some Phases of the Question that have Not
been Considered.

BY DR. C. C. MILLER.

Interest in long tongues seems to hold its place for a good many years. In the first place it was a sort of dreamy, speculative interest, with no thought of nearly approaching realization—only the thought that it would be a great thing if by any means we could obtain bees with tongues long enough to work on red clover. That interest began a good many years ago. Then there came a special interest in the big Indian bee, *Apis dorsata*, and some were quite sanguine that the problem would be solved if said big bees were introduced. But the years have gone by, and no one has ever seen a single living specimen of the giant Indian in this country. Perhaps there would be little real gain if it could be domesticated and introduced, for, according to Prof. Gillette's measurements, we have plenty of bees already with greater tongue reach than *Apis dorsata*. His measurements, however, were upon alcoholic specimens.

Then there came something in the nature of a real boom, when measurements were made, and it was found that there was a marked difference in tongue lengths, and reports were made to the effect that some of the tongues were actually long enough to work on red clover. Now that there seems something like a lull, the question is whether the interest is to be longer sustained, or whether it shall gradually fade out entirely, as in the case of many another fad without foundation.

One thing that seems to be settled is that tongue reach is not determined by tongue length, there being no fixed relation between the two. Prof. Gillette's figures

show this clearly, in one case tongues having 40 per cent greater reach than other tongues of exactly the same length. That seems to show that, if there is to be any measuring at all, it should be measurement of reach rather than length. It is possible, also, that, better than measuring either of these, would be the plan of measuring in the live bee what it actually does reach. Still further, it is possible that, better than measuring any tongues, would be the measuring of the amount of honey stored. For it may easily be, in spite of the fact that some believe that length of tongue is a sign of greater value in other respects, that there may be such a thing as lazy bees with long tongues. Not only is this now recognized at least by some, but, like the swing of a pendulum in many another case, there seems a gravitating toward the belief that length of tongue is a thing of no value whatever.

Is this belief to be accepted as the rational one? Are all the longings of the past for tongues long enough to reach the nectar of red clover, all the testimony to the effect that tongues long enough have done work in that line, to be considered as but "the baseless fabric of a vision"? Let us not lose our common sense. So long as there is nectar beyond the reach of ordinary tongues, just so long will it be a desideratum to have tongues that will reach that nectar. Let us not go to the one extreme of thinking that, if we have tongue length, we have every thing, nor to the other extreme of thinking that we can by any possibility dispense with sufficient length of tongue if we are to have the nectar of deep-tubed honey-plants.

G. M. Doolittle has given in different bee journals details of the work of two colonies during the past summer, in which it was clearly shown that the colony with shorter tongues did very much the better work, and this seems to warrant him in concluding that there is no value in long tongues, saying, in *Amer. Bee Journal*, "And this also proves that the long-tongue fad was not only premature but a mistake as well." In coming to this decision it seems to me that Mr. Doolittle has not exercised his usual judicial level-headedness. If he had a scrub cow that gave a large yield of milk, and a Jersey cow that gave only one-sixth as much, would he feel justified in relating the case in different dairy journals, and gravely announcing that this proves that Jersey cows are not superior as milkers to cows of scrub breed?

"I am led to believe," says Mr. Doolittle (*Am. Bee Journal*, 775), "that Italian bees from various parts of the country, and from colonies that gather little or much honey, all have tongues of practically the same length." It is difficult to understand how he can believe this in face of the different measurements that have been given for months, and (I think) for years. If he will look at Prof. Gillette's table (*Amer. Bee Journal*, p. 793) in which are given tongue lengths 8 per cent greater than others, and

tongue *reaches* 46 per cent greater than others, will he say these are all "tongues of practically the same length"?

In the two colonies that Mr. Doolittle compares, the poor colony with the longer tongues had tongues not quite one per cent longer than those of the good colony. What of the tongue *reach*? This, Mr. Doolittle does not give. As variation in tongue reach in Prof. Gillette's table for Italians is nearly six times as great as variation in length, there is a *possibility* that the better bees, notwithstanding their one per cent shorter tongues, had a *reach* greater than that of the poorer bees. Indeed, the reach may have been considerably greater without presenting any thing more remarkable than appears in Prof. Gillette's table, where can be seen a tongue 2 per cent shorter than another, but with a reach 12 per cent greater, and there may be cases still more striking.

Granting, however, that the reach of the poorer colony was the greater, is it at all proven that length of tongue cut no figure in the case? The average length of Italian tongues given by Prof. Gillette is 25.47 hundredths of an inch, not quite the average of Mr. Doolittle's two colonies. It seems reasonable to believe that this is considerably above the average of Italian tongues; for, in responding to Prof. Gillette's call for tongues to measure, beekeepers would be likely to send in their best bees. So I think it not unreasonable to believe that both colonies had unusually long tongues, and one colony did poor work in spite of its long tongues. The practical question is not so much as to the comparative tongue lengths of the two colonies as this: "Would that better colony have done just as good work with shorter tongues?" In a field of red clover with the depth of tubes varying from 12 to 37 hundredths, would bees having a reach of 21.5 (Mr. Doolittle's bees *may* have had that according to the table) have no advantage over those with a reach of 15 or 16? That depends altogether upon how plentiful were the tubes measuring only 12 hundredths. If all tubes were of that depth, there never would have been any red-clover problem, and likely no long-tongue fad. But ordinarily such tubes will be very scarce, most of them being beyond a reach of 17 or 18, and so beyond ordinary reach (I think the average Italian reach given by Prof. Gillette is 17.85, which I suppose to be above the ordinary). In such fields it seems reasonable to believe that there might be a very great advantage in having tongues with a reach exceeding 18 hundredths.

As I have already intimated, it is not the part of wisdom to go wild over long tongues, and count nothing else important, and I would put more stress upon a record for storing without any measurement; yet I do believe the man is off who says length of reach is a matter of no consequence, whether it be the editor of GLEANINGS or any one else.

Marengo, Ill.

NOTES OF TRAVEL.

Prospectors for Gold; Wisconsin Bee-keepers in Arizona; a Visit with Wm. Lossing and Family, of Phoenix; Bee-keeping for Women.

BY ERNEST R. ROOT.

While Mr. Wm. Rohrig and myself were on the road to visit bee-keepers, we saw in the distance two donkeys (burros, I suppose) loaded down with camp equipment, and a solitary man straggling along with them on foot.

"What is that?" I said.

"Oh! He is one of the gold-prospectors with his mules and camp equipment," said Mr. Rohrig.

As they drew near, the sight, though common in this country, was very novel to me, and I was wondering how I might get a snapshot of the trio unawares. But the trouble was, one of the animals was away ahead of the other, and the man came along behind with the rear beast, prodding him along. Finally Mr. Rohrig called out:

"Say, stranger, this is a tenderfoot from the East, and he would like to get a picture of you and your equipment."

"All right, pard; where do you want us?" said he good-naturedly.

At first one of the burros seemed indisposed to get into the "group," and finally his owner grabbed the halter of each and held them while I pulled out my pocket kodak and took a snapshot. The result is before you.

All through this western country may be seen prospectors a good deal like the one here seen. The country is warm, and they dress merely for comfort. So far, as a rule they have not "struck it rich," but are always *expecting* to. Their scant means do not permit them to travel in palace cars, and consequently they procure a couple of burros at a small cost, camping-outfit, cooking-utensils, etc., and then "rough it" on the mountain-sides. Their faithful animals will live on almost any thing, and the cost of keeping them is almost nothing; while the man with his spade, pick, shovel, and pans, digs and pans as long as his "grub" lasts in the hope of some day striking it rich. When his diggings do not "pan out well," he will pack up and start off on the road for new fields, and that was what our "pard" was doing when we asked him to stop long enough for us to take a picture.

Speaking of "panning out," I was quite interested in noting that this expression originated among the gold-diggers in early times. After digging for a considerable length of time the prospector takes a pan with a sieve bottom, dips down into the mixture of diggings, with the water, and washes and washes until he finds the precious metal. Perhaps his diggings pan out well, but more often they do not. But these gold-hunters, even if they do not "strike it rich" (and that is another expression from the gold-diggers) generally manage to

FIG. 1. —A GOLD-PROSPECTOR.

eke out a living, because they find just enough of the precious metals, either gold or silver, to make it possible for them to continue in the business, with the never fading hope that *some day* they will really and truly make a rich find. So abiding is that expectation that, as a rule, they never are good for any thing else but hunt and dig until death intervenes.

After we had taken a photo of the man

and the donkeys we visited Mr. Martin Rohrig, a brother of William. He has been in that Territory only a short time, but, according to his brother, he is one of the best bee-keepers in the vicinity; a mechanic and a genius, he makes all the little fixings that he requires for his work among the bees. Although he had been there but a short time, he now owns and operates 320 colonies; and at the present rate he will

FIG. 2.—H. F. DOLSON AND HIS JUST-MOVE-IN OUT-APIARY.

soon have a great many more. I should be glad to introduce him, but the photo was too poor to reproduce.

Another bee-keeper in the immediate vicinity was Mr. H. F. Dolson, who has 250 colonies. He hailed originally from Wisconsin; but, disappointed on account of poor seasons, he had moved westward with his family. The day we called on him he had just moved the bees from an out-location to his home, and had just arranged them in order under his bee-sheds as we came up. You will note in the photo, Fig. 2, that he is in the act of taking off the covers, and removing the screens and the binding-strips. Mr. Rohrig and I joked him a little because he was using the old-fashioned unspaced Langstroth frames—frames that he had to fasten with numerous sticks pushed down between. We recommended him to

use Hoffman frames—those that did not require special fastening, and which could be handled as easily and rapidly as the old unspaced frames. Mr. Dolson explained that he began with such frames, and could not afford to change.

Not being able to secure a satisfactory photo of him with his veil on, under the shed, I asked that I might have the privilege of kodaking him rough and ready, just as he was when working among the bees. Complying with my request, he stepped to the house and “posed” in an easy-chair. The ever ready kodak clicked, and here we have him in Fig. 3.

We next took the road again. Just as we were getting into the wagon another Wisconsin bee-keeper, Mr. Wm. Lossing, and daughter, drove up, having just come from town. It was then toward night, and

FIG. 4.—WM. LOSSING AND FAMILY, ALL OF WHOM ARE EXPERT BEE-KEEPERS.

Mr. L. was very anxious that I should stop with him; but having made other plans I arranged to call on him the next day with Mr. W. L. Chambers, the boy bee-keeper who owns 500 colonies. The following day found Mr. Chambers and myself at the Lossing home. Learning that every member of the family was a bee-keeper from the ground up, I craved the privilege of a photo of the whole crowd. The young ladies protested considerably, as they were "not ready;" but after some coaxing I finally secured what I think is a good photo of the whole family, see Fig. 4.

Mr. and Mrs. Lossing sit in front. Verna on the right and Maude on the left are the two older girls. Either one of them, as their father expressed it to me, was the equal of, or better than, any man in the yard; for a girl, whatever she does, will be neat about her work, and this is a matter of prime importance when handling soft combs, honey, and propolis. Yes, these girls could take off combs or sling honey;

FIG. 3.—H. F. DOLSON AT HOME.

and the little miss in the middle, whose name I have forgotten, is also a bee-keeper; and when the extracting days come the whole family turn out and help the father. Mr. Lossing and the girls, as I understand it, have charge of 700 colonies, 400 of which Mr. L. himself owns.

A good deal has been said in years gone by as to whether the gentler sex are strong enough to take care of bees. I well remember the question was once asked of Mrs. L. Harrison, at the International Bee-keepers' Congress in New Orleans, some years ago, whether a lady could keep bees. Mrs. H. very promptly replied that she did not know; but that she did know that a woman could. Mr. Lossing's helpers appeared to be women of the Harrison kind; and not

only women, but I should judge they were ladies fit to grace any society or any home in the East. Many and many a woman has found strength, health, and pleasure, in keeping bees; and I am glad to introduce to our readers the good-looking girls, old and young, belonging to Mr. Lossing's household.

WISCONSIN V. ARIZONA FOR BEE-KEEPING.

"Mr. Lossing," said I, "how does Arizona compare with Wisconsin for bee-keeping?"

"Why," said he, "money could not hire me to go back. A beautiful climate the year round, no chilling snows, no cold weather, but warm balmy air, and honey galore."

With that he took me out into his back yard and showed me some trees only a year or two old, that were young thrifty growing specimens, capable of giving a good amount of shade, and not a little fruit. These, he said with some degree of pride, were samples of what a Wisconsin man can do in Arizona with only a year or so of experience.

In our next issue I will introduce to you some of the members of the Bee-keepers' Association of Maricopa Co. Among them will be J. P. Ivy, a bee-keeper who operates some 700 colonies, and Mike Wall, the owner of 800 more. "Mike" is a character — of the right sort, I mean—always happy and full of fun. More anon.

CELLAR WINTERING.

A Model Bee-Cellar and its Construction.

BY R. F. HOLTERMANN,

Formerly Editor of the Canadian Bee Journal.

A great many articles have been written upon the subject of wintering bees; not a few discussions have taken place at conventions and among individuals upon the same subject; and yet I venture to say that, taking all of those who have kept and still keep bees, the average man knows all too little upon this important subject; and the very best known in our bee-keeping ranks would get better returns did they know more about proper conditions for wintering bees, or had better facilities for practicing what they do know.

DIVERGENCE IN OPINION.

Before beginning, or, perhaps it might be more correctly stated, in opening the subject on hand, let us ask ourselves why it is that there is so great a divergence in the opinions and practices of bee-keepers; why do the practices vary so much? why so much confusion? Is it not because conditions and results are not weighed as carefully as they should be?

Take cellar wintering. One says, "Use a sub-earth ventilator;" another one says, "Use a ventilator;" the third says, "No ventilation is required." Again, one says, "Have a temperature of 60;" another, 52;

another, 42; while another says that just above freezing (32) is best. One says outside wintering is better; another, cellar. Let us suppose that conditions are quite alike, and one man says his bees come out all right with a temperature of 52; the other says his bees will not winter well at that temperature, but he wants 42. Under these circumstances both can not be correct. The trouble simply is, that one man is satisfied with poorer results than the other; and so unless we admit, as in every thing else, that like conditions produce like results, we simply put ourselves down as less intelligent than others, and we are preventing the advancement of the business, which is an instrument in our hands, with God's blessing, first to glorify him, and, secondly, to bring our "food and raiment."

The proper wintering of bees, and bringing every colony out strong in spring, not only in bees but vitality, is necessary to success, and the very foundation of successful bee-keeping. The sooner we recognize this the better, the more the cost of producing honey will decrease, and the less frequent will be the seasons when we do not obtain surplus honey.

These expressions may be considered exaggerated and strong, but they are none too strong, and not exaggerated. In writing, I am not seeking to please every one, neither have I the time to answer those who may object to the statements I make. If any take exceptions to a writer's statements it is for the public to judge.

A man to-day asked me, "Are any of

your bees dead yet?" Having charge of something like 200 colonies I answered, "Yes, if you mean bees. There are bees dying continually." He said, "Oh! I mean colonies." I answered no, and I should consider it a very serious matter if any *colonies* were dead.

What I want to bring out is this: Many are satisfied if they bring the hives out with live bees in every one. No good bee-keeper should be content with this. What every one should aim at is to bring them out of winter quarters with the least consumption of honey, and the least possible loss of bees and loss of vitality in the bees. Nothing less should satisfy.

THE QUESTION OF VENTILATION AND TEMPERATURE.

We read grave discussions as to whether bees require the cellar in which they are wintered to be ventilated. When we understand the nature of the honey-bee, its delicate breathing-cells, its abhorrence of impurities, it seems to me a waste of time to discuss such a question. We know how restless we become, and how injuriously we are affected, when the air becomes foul in the room we are in. Again, the bees consume honey. This turns the saccharine matter in the honey into heat and energy. It expels the water; and if the atmosphere is not changed it must become damp and abnormal. Moisture about the bees, we know to be injurious.

Again, as to temperature, if a floor has been scrubbed in the kitchen, and we sit down in the kitchen at a temperature of 70,

EXTERIOR VIEW OF CELLAR.

those liable to catch cold run great risk; but raise the temperature, and the evil from the dampness is largely overcome. Again, I can be comfortable with an overcoat on when I would catch cold without it. When the temperature of a cellar is discussed, would it not be well to know whether the wooden covers or cushions are on the hive or not? A lower temperature will answer if the cushions are on the hives to prevent heat from passing off. Again, where the humidity is great the temperature must be higher.

I previously spoke of ventilation. I can understand that, the more perfect the conditions, the less movement and activity of the bees, and the less atmosphere is consumed, and the less stores are consumed; but if there is no supply of fresh air in time, the air *must* become damp and vitiated, and then the bees become restless and active, and rapidly consume more stores, use more air, and wear themselves out. Again, weak colonies can stand a higher temperature. The strong generate more heat. These are all questions that require consideration. If the cellar is poorly constructed the air gets in and out here and there, and an uncertain quantity is supplied in this way.

HOW MR. HOLTERMANN COMES TO BE ASSOCIATED WITH BEE WORK AGAIN.

Last summer I found myself for some two years out in evangelistic work. During that time I was almost entirely in the back districts—those neglected on account of inability to help financially, but in which there was much blessing. During that time I spent not my own money, but what the Lord had made me steward of, and what I am afraid many call their own. When that was exhausted I looked around to do as Paul did—went to “tent-making,” and I preached where opportunity arose. At Braintree, or within two miles and a half of it, there is a wealthy stock company—the Bow Park Company, Limited. They have over 1000 acres of land, often over 1000 hogs, several hundred head of fattening steers, sheep, etc. They also make pickles, having about 45 acres in cucumbers alone. The blossoms of these, last year, were much appreciated by the bees. They have about 150 acres in alfalfa, and will have a large area in alsike clover. These people having the capital, I proposed going extensively into the bee business, they to furnish the capital and I to manage, and share in the proceeds. They, having plenty of money awaiting suitable investment, consented, and we decided, in addition to producing honey, to sell bees and queens, to manufacture honey vinegar, and, when suitable opportunity offered, buy honey to sell again. The company has also an extensive pork-packing plant, and intends to make honey-cured ham and bacon; and the travelers selling pork, bacon, lard, and pickles, could also push honey vinegar and honey. Mr. J. M. Shuttleworth, the president of the company, is also connected with

a company, the most extensive exporters of apples, probably, in America, for they have agencies in Boston and New York. It is, therefore, the intention to export honey. It would pay more such firms to engage in the handling of honey, and get in touch with bee-keepers; and it would also be an advantage to bee-keepers to get honey more extensively distributed, as well as products from honey.

PLANNING A BEE-CELLAR.

Our first step was to plan a bee-cellar—one in which a large number of colonies could be wintered, and wintered well. You, as editor of GLEANINGS, situated at Medina, O., know that, in establishing and running a business, the profit often consists only in what you can save in management. What one man throws away is another man's living and profit. That bee-keeping has not been cut down to this, I believe; and yet the most successful man must take into account every detail. In Ontario—in fact, Canada—and doubtless in many portions of the United States, with the best cellar wintering, and the best outside wintering, the bee-keeper can save 7 lbs. of honey by cellar wintering. The bees do not require to generate as much heat, and the temperature does not vary as greatly. Variations of temperature disturb the bees; increased consumption of stores causes increased loss of vitality. The loss in this direction can be estimated only very broadly. Again, an outer case suitable for this climate costs 50 cts. or more. It is our intention to establish out-apiaries until at least 500 colonies are run. A saving of 7 lbs. per colony on 500 colonies would be 3500 lbs. In wintering, cases would cost at least \$250. During prolonged and steady cold, wintering becomes uncertain; and we considered, in view of this fact, that a honey-house, work-shop, and store-room was required—that is, it would pay us to build a first-class cellar, and the house above. The cellar is intended to hold the 500 colonies.

The size is 40×24, and 7 feet in height in the clear. The entire cellar is below the level of the ground. It is built in a sand-bank; is double-walled with a 9-inch wall outside, a 3½-inch wall inside, and a 2-inch space between. The ceiling above is a double floor. The first floor is matched lumber; then a heavy felt paper; then ¾-inch strips and a tongue-and-grooved floor above. The cellar floor is cement; and, laid in the cement, is a board floor. There is one stairway coming from outside. This is for summer use, and is the stairway down which the bees are carried for winter, and out of which they are taken for spring. Another stairway goes down from the shop above, and is for winter use. The object of this construction was to secure thorough isolation and no ventilation through the wall. If ventilation comes, here, there, and everywhere through the walls, the bee-keeper has no control over it, and it may come in when he least requires it. By having a proper ventilator, one which can be

regulated, he has something like a business-like arrangement.

The air comes in at the center of the cellar floor. It is connected with a sub-earth ventilator of three thirty-foot lengths of eight-inch glazed tile joined with cement, making it water-tight. It is laid 8 feet below the ground, and connects with an upright pipe 25 feet high, and on top of it is a cowl always facing the breeze. The air passes through the sub-earth ducts; and they, being water-tight, can not get any moisture from them—a defect that many sub-earth ducts have. But the temperature is raised by passing through the warm earth, as the temperature of the air entering it rises and becomes more capable of taking up moisture.

In the plan you will notice two partitions running crosswise of the cellar; and two, again, join these. In this center compartment stands a self-feeding coal-stove, and it stands right over (but two feet from) the floor where the cold air comes in. This stove regulates the temperature, and, after

being warmed to the required temperature, it passes into the bee-cellars through wooden pipes at the top, which discharge in the far upper and outer corners of the cellars. The stovepipe enters a double chimney, one part for the stove, the other for a foul-air vent. At the opposite side (but nearest to the two wooden partitions) is a foul-air pipe which, by means of vents and stops, can be made to draw the air from either the top or bottom of the cellar. These pipes draw off the foul air, and at the top of the chimney is another cowl, just the opposite of the previous one, which has its back always to the wind, and thus becomes a suction cowl.

In this way temperature and current of air can be controlled. The cellar is new, and 70 of these colonies never had a flight after being two days closed up on the cars, yet all appear to be wintering well—certainly a very severe strain on its qualities for wintering. I find that, when cold walls are exposed to the atmosphere, the moisture condenses there; but here not a particle of

INTERIOR VIEW OF ONE OF THE COMPARTMENTS IN THE CELLAR.

moisture is apparent anywhere. It is carried to its proper place *outside*. A candle (I never take an oil-lamp) held close to the cluster shows it dry. The bees just lie there quiet as in sleep. Occasionally a cluster appears slightly active, but the next time this is quiet.

The hives stand on benches 20 inches high in front, 22 at the back. Four hives can rest on each bench side by side, and four hives can rest one on top of the other.

It will be seen from the bench that the back of the hive is 2 inches higher than the front. I like the back of the brood-chamber raised by means of two blocks $\frac{3}{8}$ inch from the bottom-board, giving a current of

air through the hive. A warm cushion should be placed on top of each hive, especially the top and bottom row. Strong colonies so placed I like to winter at a cellar temperature of 42—perhaps even a lower temperature will answer. If no cushions are used, if the colonies are weak or the bank a clay bank with more moisture, I would raise the temperature some. Note, I keep a thermometer in each cellar, suspended about midway from ceiling to floor, and midway between the fresh-air and foul-air pipe. All these points are important for comparison; but to discuss the question with profit we must get the conditions and then compare; and let us not be

ELEVATION AND GROUND PLAN OF THE CELLAR.

content with what we should not be content with, and delude ourselves with believing we are doing the best when we are not.

When a man loses in winter a colony with a queen and plenty of good stores, there is something wrong. Many a man gets no honey-flow, because the bees wintered so poorly they could not take advantage of the flow that came, especially early clover, or a blossom which stands in a relative position.

In the house above the cellar I have a comb-honey room, a room for extracted honey, and a room for store combs and hives. The first and last are almost air-tight, and can be fumigated. Then there is the workshop.

There are, of course, other conditions, such as good stores, the strain of bees, size of brood-chamber in proportion to the number of bees, etc., which influence wintering; but I have not time to enter into those questions now.

There is one item in your Jan. 1st issue that is worth more to me than the subscription price. I have had every volume for over twenty years—in fact, ever since I have kept bees. No man can afford to do without a periodical upon the subject he is engaged in.

Brantford, Ont., Can., Jan. 20, 1902.

Later.—It was with much pleasure that I noticed your editorial remarks in your Jan. 15th issue concerning the necessity of fresh and pure air for the bees. If I had you here for 24 hours I could thoroughly convince you that temperature is also of great importance. In that flash-light photo of hives piled up in the cellar, the second hive from the top, front row, right-hand side, is one by which I can tell you to a degree the temperature of the cellar, or I can go to the thermometer and tell you to what extent the bees appear under the combs and bottom-bars. How? At 40° the cluster contracts sufficiently to draw all the bees above the bottom-boards, and out of sight when you cast your eye through the opening made between the bottom-board and body by blocking up the brood-chamber $\frac{3}{8}$ of an inch. At 41 a few bees appear below the bottom-bar; at 42, still more. This condition has prevailed all winter. That cellar, I believe, has not varied four degrees all winter, and it affords a beautiful object-lesson. Variations in temperature cause, as per above (contraction and expansion of the cluster), activity; and to husband vitality and stores, this is not desirable.

At this date, Feb. 1, not one hive is spotted by discharges from the bees in winter quarters, and they make no more noise than when they first went in. R. F. H.

[This, according to our experience, is good orthodox teaching on the subject of bee-cellars and their construction. While temperature is important, ventilation is more so, particularly if it be under control. The plan outlined above is ideal if it is expensive. At present we are securing

ideal results in our cellar by opening and closing of doors at night, for we are scarcely losing any bees, not to say colonies. Our cellar is bone-dry, air sweet, and bees *perfectly quiet*, notwithstanding the noise above.—ED.]

.....

BEE CELLARS OR REPOSITORIES.

**The Importance of Having them Properly Ventilated;
Painted Hives Soaked with Moisture; a Nut
for Mr. Doolittle to Crack.**

BY T. F. BINGHAM.

I wish to call attention to what Mr. Doolittle says in the January *Review* regarding the effect of paint on his hives, and how they were affected by moisture. In the 10 years he has been wintering bees in his cellar successfully, I do not remember, until this winter, seeing a description of it and its shortcomings, if any. But now incidentally it has been shown by him that he had found air in his cave incapable of supporting combustion (that is, a lighted lamp) away from his three-door entrance. On p. 21 of *Review* above referred to, near the bottom, he says, "The mistake which I think he (Mr. Miller) makes is in assuming that this wooden wall remains dry during the winter and spring," and then Mr. D. goes on to explain that the wood between the walls of propolis and paint of his painted hives was "thoroughly saturated with water—so much so, if possible, the same were worse than green lumber." From this statement there can be no doubt as to the condition of his cellar. He is not alone in cave wintering in New York; but while I am unable to say that his plan is the common one, I am of the opinion that most of the New York cellar repositories are constructed upon the practical non-ventilation system.

Mr. Doolittle's conclusions on the paint and moisture question are reasonable, and deduced from experience that no one can deny. The point I wish to raise right here, however, is not the effect that paint has when applied to bee-hives, but, *how did the hives absorb water to such an extent as to be equal to green lumber?* The no-paint remedy that Mr. Doolittle applied, no doubt facilitated the drying of his hives after being brought out of his cellar; but would it not have been better, or at least as well, to have kept the hives *dry* in the cellar, with or without paint, with ample ventilation?

Mr. Doolittle's stone-roof air-tight cellar is quite the reverse of your repository under the machine-shop. It would be of no use to inquire of you if the hives below the shop were dry.

My first winter's experience with a three-inch ventilator-flue in my cellar demonstrated conclusively its insufficiency. My hives, like Mr. Doolittle's, became charged with water; and, while not painted, they did not fail to show that they had been five months in a warm damp atmosphere. A

hundred colonies of bees consuming 400 lbs. of honey per month would liberate not less than 35 to 40 lbs. of water per week. Just suppose two pails of water to be thrown into an air-tight cellar once every Sunday for five months, said cellar to be at a temperature of 40 to 50°. Mr. Doolittle is right. No doubt his hives needed drying. The winter problem remains the problem where the mercury for five months registers from 35 above to 12 below zero.

Farwell, Mich.

[I have just been down in our machine-shop basement, where the bees are. Every thing is dry and sweet, and the dust on the cellar bottom is bone-dry. The number of dead bees on the floor is still surprisingly small.]

I wish our friend Doolittle would construct a large air-duct up through the roof of his repository, of good height, say 16 in. square, and see if there would not be dryer and better air, better wintering, and dryer hives. I am well aware he once had a roof ventilator; but, if I remember correctly, it was very small, having, as I estimate, only a thirtieth of the area of the ventilator recommended by Mr. Bingham. Our Farwell friend is the first one to recommend a ventilator so large, and our own experience seems to prove that his idea is correct. The little three and four inch ventilators were so small as to be worse than useless.—ED.]

TWO-STORY HIVES FOR COMB HONEY; HOW TO WORK THEM.

I am a beginner, and have read with interest Dr. Miller's article, pages 329—331, of last year's volume, and your footnote about handling colonies in a double-story hive for comb honey till the harvest or flow is on, and I would thank you to answer me a few questions.

1. When taking away one story, is the queen left in the hive full of brood with the bees? As I judge, she having no room to lay, would not this cause the swarming fever? If I am right, how do you avoid it? If she is removed with the lower story, she will raise a new colony, of course. If this is done, do you let the other hive raise a queen from brood?

I am anxious to find a way to avoid increase and prevent bees from swarming, when raising comb honey. H. DRISHAUS.
Omaha, Neb., Jan. 30.

[As a general thing the queen is left with the brood in the lower story or that stand that is designed to receive the comb honey, although there are times when she may be put with the removed part of the hive; but in our experience a queenless col-

ony does not show the snap of one that has a mother. There may be times when swarming might be hastened on by confining her majesty to a brood-nest in which there is no opportunity for her to lay eggs. This will be particularly so if the upper story is taken off at the *beginning* of or just before the honey-flow. Our practice has been to leave the super of extracting combs on till the bees have stored some honey in it. When they get in the notion of going above, and storing there, they are likely to keep on storing above in the super of sections that has replaced the one of combs. But if, on the other hand, you notice they are loafing at the entrance, it is better to leave the upper set of combs on until they have ceased loafing or have swarmed. But in using these double hives the *large* entrances should *always* be used. There will then be very little likelihood — at least that is true according to our experience — of loafing or clustering out. The point to be remembered is that the upper story must not be removed *before* the bees get to work storing honey energetically. When they have "got their hand in," they will keep right on, no matter what the queen has got to say about it, below. Locality may alter the behavior of the bees. But in our experience the two-story colonies are not nearly as much inclined to swarm, and, if worked properly, they will secure more comb honey.—ED.]

HONEY STATISTICS.

I write to say that I want some statistics that I felt in hopes you could give to me. First, the average annual production of honey in the United States. Second, the average production of wax in the United States, and about the number of colonies of bees kept; also what State produces the most honey, and how much.

Bowling Green, O. A. J. KILGORE.

[There are no reliable government statistics relating to the amount of honey and wax produced in the United States; but we can give you some fairly accurate estimates on some items. Something like fifty million pounds of comb honey is produced annually in the United States, and in the neighborhood of one hundred millions of extracted. The total value of honey, both comb and extracted, would approximate ten millions of dollars. At a rough guess there are all the way from four hundred to five hundred thousand bee-keepers, or an aggregate of half a million all told. This includes both the small and large producers.]

Concerning the amount of wax produced in the United States, I can not give you very accurate figures. There is something like two hundred thousand pounds of foundation made annually in the United States. Just how much wax is used for making candles for the Roman Catholic Church, dental purposes, and the general arts, I could not say; but probably as much more,

or a total of between four and five hundred thousand pounds, as the annual production of wax. California, in a good year, is by all odds in the lead for amount of honey produced. In a fair season it will ship from its own border three to four hundred cars. The next best State, probably, would not aggregate above 50 cars.—Ed.]

And the Lord God said unto the woman, What is this that thou hast done? And the woman said, The serpent beguiled me, and I did eat.—GEN. 3:13.

This woman, according to her own story, was beguiled by the serpent. That was her excuse. By her own confession she listened to the serpent. She stopped to talk with him. I presume we have no right to take it for granted she knew he was a serpent and an enemy to mankind. There is hardly a question, however, but she knew she was doing wrong. The garden did not belong to her. She and her companion were permitted to live in it. The great Ruler of the universe, who made not only the garden, but these two, the parents of the human race, had given orders what she should do and what she should not do. This she confesses in her talk to the serpent. But she *listened* to him, and was persuaded to disobey. Some of the friends keep telling me, when I talk as I am going to talk to-day, that there *is* no serpent—that there is *no prince of darkness* who is constantly seeking to destroy mankind. They say it is only a myth or the work of the imagination; yet these same people agree with me generally, and say I am doing lots of good in warning people regarding the pitfalls that beset humanity.

We were all startled by the announcement in the papers of Jan. 30, of the escape of two noted criminals and murderers from the jail at Pittsburgh. I wish to consider the matter a little; and in order to get it before you, permit me to copy an editorial from the *Cleveland Leader* of Jan. 31:

A CASE OF SENTIMENTAL SYMPATHY.

The Governor of Pennsylvania recently granted a reprieve to two desperate criminals who were awaiting execution for murder. They had killed, or helped to kill, a grocer in Pittsburgh because he did not quietly submit to the robbery of his store and dwelling. Then the desperadoes killed a police officer who tried to arrest them.

Both of these men had long careers of crime. They were known to be daring, resourceful, and dangerous in the extreme. They could never be of any use to the world while living, and their decreed punishment was eminently just. But because a sentimental young woman of Pittsburgh, perhaps impressed by the statements current regarding the courage, audacity, and ingenuity of the murderers, who are brothers, or possibly influenced by the comeliness of the more experienced of the criminals, asked that their death be delayed, the Governor put off for more than a month the date of their execution.

That proved to be time enough for the desperadoes

*It seems that even the Governor of the great State of Pennsylvania was slightly "beguiled" also.

to complete their task of sawing the bars of their cells, obtaining revolvers from some confederate, and adding a sensational escape from jail, accompanied by attacks upon two guards which came barely short of murder, and showed the utmost indifference to the taking of more lives of honest men. Now the murderers are at large, armed and more utterly callous than before, if that were possible, as to brutal crimes of whatever nature. They can commit a long series of outrages upon good people and their property before they come to the end of their bloody story, which can hardly be any thing else than violent death.

Every officer who may try to do his duty if he gets a chance to attempt the arrest of either or both of these desperadoes will risk his life. Several honest men are likely to be killed before the murderers end their work of rapine and assassination. Fresh tragedies are confidently expected by experienced police officers. Is it not clear that sympathy for convicted murderers can be overcome?

At the time the above editorial was written, nobody knew how it was possible for these desperadoes to get out as they did; but a dispatch in the papers of Feb. 1 throws some light on the matter:

BUTLER, PA., Jan. 31.

With half a dozen or more bullet wounds in their bodies, Edward and John Biddle, the murderers who escaped from the Allegheny County jail in Pittsburgh, Wednesday, were captured by officers after a desperate standing fight in a sleigh on the road between Butler and New Castle this evening.

Mrs. Kate Soffle, the wife of the jail warden who supplied them with saw- and revolvers and then ran away with them, was caught with them. When the officers began firing on them she implored Edward Biddle, the murderer with whom she was infatuated, to shoot her. Throwing her arms from around his neck, he refused, and turned to battle with the officers who had brought the two to bay. She then fired a bullet into her own breast. All three are now in this city. Doctors say that they will die.

I am going to take the liberty right here, dear friends, to read a little between the lines concerning the communications that have appeared lately in regard to this matter. Of course, I do not know the full particulars, but I think I can guess pretty nearly the state of affairs, as I have had some experience and some acquaintance with those in our jails as well as those outside. This Mrs. Kate Soffle, the wife of the jail warden, was "*beguiled*" by a "serpent" in the shape of Edward Biddle. Both of the brothers were under sentence of death. Their previous history indicated that they were desperate men; and if there was any hook or crook by which they could elude their keepers they would do it. Their previous record of crimes shows it plainly enough. I can imagine the notorious Edward saying to his brother, "Look here, Jack, we are in a tight place. Unless we can bribe or make friends with somebody to help us, there is no hope. Drowning men catch at straws, you know. That good-looking woman, the wife of the warden, I imagine as she looks at us, is already touched with a feeling of sympathy. If I had a little more time before our execution, and fortune favored us, I think I might make friends with that woman, and get her to provide us the means of getting out."

The Bible teaches us on every page that God helps those who call on him in time of need. May be you think I am taking a liberty when I suggest that I have reason to believe *Satan*, in like manner, helps those who belong to him in like manner when

they call on him—at least he helps them after a fashion. Edward Biddle got the Devil to help him, without question, in the work he set about. From the position Mrs. Soffle held, she had access to the prisoners. This man improved his opportunity, and, even with all the odds against him, persuaded this woman he was innocent of the charge; furthermore, that he had never murdered *anybody*. He was a victim of circumstances. They had talks at different times. Her sympathy was at first aroused for, as she supposed, an innocent man, or comparatively innocent, who had been greatly wronged. The fact is hinted at that he was a good-looking young fellow. And, by the way, this is not the first time that I have seen certain women seemingly drawn toward a man who was desperate and reckless. The air of bravado that many of these fellows put on is oftentimes mistaken for heroism, not only by silly women but by silly boys. We do not know what woman it was that persuaded the Governor of Pennsylvania to put off the execution for a month or more. It may have been this same woman, or some other like her, whom she enlisted in her cause. We need not go over these sad details, even if we knew something about it.

In our second clipping we are told that, while facing death, and with all that crowd about her, she—a married woman, and the mother of children—threw her arms around the neck of Edward Biddle, and implored him to shoot her. The *Cleveland Leader* uses the word "infatuated," and it is the right word, without question. She was so infatuated with that reckless, blood-stained criminal that she deserted her husband, her children, her good name, even her hope of heaven, and all that she or any woman in like circumstances has, for this silly, foolish infatuation.

Now, dear friends, you may think I have been laying a tremendous amount of blame on her poor shoulders. So I have, for it belongs to her; but still I pity her. If she is now alive I pity her from the bottom of my heart, for she was beguiled like the mother of the human race by looking at and listening to the serpent. The first verse of the chapter from which I have taken my text reads, "Now the serpent was more subtle than any beast of the field that the Lord God had made." These desperadoes evidently took it for granted they could make no headway with the warden. They did not try it. Neither did Satan undertake to do any thing with Adam. He did not tackle him at all. As I understand it, he commenced his conversation with the woman, and in a roundabout way. Oh how many times in this short life of mine have I seen Satan in human form—perhaps I might say in the form of a good-looking man with lots of money—commence in a roundabout way to entrap some woman—yes, may be a child! I once saw a ruffian give the wink to some of his companions, and then approach a little girl that came into the store to trade.

He began talking with her, admiring her hair, stroking it with his hand, and telling her how he loved little girls. I ached to see that man horse-whipped out of town. I do not know what became of him; but if he kept on in the way he started he is probably now behind the bars; or may be his life has paid the penalty of his many crimes. Please do not misunderstand me, dear friends, and think I mean to say that Satan always does his work in the form of a good-looking *man*. Let me tell you of another story of prison life, of which every word is true.

A young man was in jail awaiting his trial for a penitentiary offense. A godly man who was visiting jails spent some little time with him, and he was soundly converted. Some of you may smile at my being so positive. But wait till my story is ended, and you shall be the judge as to whether his conversion was genuine or spurious. The sheriff and his wife were both Christians. They found John had stopped swearing, card-playing, using tobacco, and every thing else that was bad; and when he took to reading his Bible, and asking God, as he knelt on that stone floor, to forgive his past sins (and even crimes), they rejoiced, and both lent him a helping hand. John was a good-looking, stout, muscular young man; and with his good looks and muscle he had a spirit of reckless daring. He did not fear death nor any thing else. He delighted in dangerous feats where life and limb hung in the balance, and I rather think that was one secret of his desperate acts during the past. The sheriff's wife was a brilliant, good-looking woman. She was a leader in church work. She helped John in studying the Bible, taught him to sing beautiful hymns, etc. When John began to feel uneasy at so many attentions she laughed at his diffidence, and told him she was old enough to be his mother, and that it was all right. But the time finally came when John, who had, before his conversion, been reckless among women as well as in other ways, was to have his Christianity tested in a way he had never dreamed it would be. His confession, made to the friend who, in God's providence, led him to Christ, was something like this:

"Dear brother B., you do not know—in fact, you can not understand—the terrible danger that besets me. I want to hold fast to my religion; I want to be a Christian. In my old life I was always ready to go half way, or more than half way, when any thing like this crossed my path. This woman's husband is one of the best men I ever knew. I would not hurt his feelings nor harm a hair of his head for the world. But just see where I am placed. I ought to go away from here. But I am a *prisoner*, and this woman is my keeper. My own peace of mind demands that I never see her nor speak to her again. God knows how quickly I would get away from her presence or influence if I could. I can not stand it—oh! I can not stand it. I am too

weak—it is not in me. Oh! God help me in this great and unexpected trouble. Help me to be a true Christian and a faithful follower of Christ Jesus.”

And this strong man bowed his head and wept convulsively. His older friend—older in years as well as in Christian experience—told him God would provide a way out. He assured him that a sense of his own frailty and weakness was the best indication he could possibly have, that he was on safe ground. “Him that cometh to me I will in nowise cast out.” In a few short days John was not only free from the danger that threatened him, for God opened his prison-doors, and he went out among men, a free and an honest man.

There is something peculiar about Satan's work along this line. One of the peculiarities is this: If Satan once gets a foothold—if a man or woman either stops to listen to him, or is curious about this strange labyrinth (of sin) that seems harmless enough at the outset—if, as I have said, either the man or woman decides (perhaps only out of curiosity) to go just a little way in this direction, and explore, they will be pretty sure to be lost. The winding-up is often like the newspaper clipping, only this is a little *more* marked than any thing I have seen before. *She* became *infatuated* with a *murderer*. Satan does not scruple about whom he uses in this kind of work. The man or woman whom he has woven into his toils may be very commonplace indeed. The world may look on and say, “Why, what possesses that fellow to go crazy after such a woman?” I do not think the world often gets a true answer. It is this: It is the Devil *himself* that “possessed” him, that made him act so. It is the Devil, and he *only*, that possessed that man so as to induce him to forget his wife, his children, his good name, his religion, his Maker, and his all. Sometimes the parties are excused by saying it commenced in a harmless, innocent way. I have heard excuses made like this: “I do not believe either of them thought of doing any thing wrong when it commenced. Circumstances were such that they were thrown together a great deal; and, before they knew it or realized it, their peace of mind was gone, and Satan had them in his toils.” I can not quite agree with this. I think these two people—that is, these two whom you say did not dream of any thing wrong—*did* know there was just a little wrong; and it is the *little* wrong that does the harm. Whenever there is any thing in our lives that it seems expedient to cover up from the full light of day, there is danger of wrong. I do not believe in secrets; and perhaps I might say, in parenthesis, I do not believe in secret societies; but I will not quarrel with those who believe otherwise. If we are at all times willing that all we do and all we say may, if occasion demands, be open to the light of the outside world we are on pretty good ground. Of course we do not want strangers intruding on our privacies; but what I

mean is this: Whenever it shall be necessary or expedient that any particular event of our daily lives be spread out before the world, if we are honest and true with our fellow-men at such times as this we need not be worried nor troubled.

There is something peculiarly Satanic about all this work. As a rule, a man who is a professor of religion is not likely to drink or gamble or steal; but it has been thrown up to us again and again that some of our devout Christians who talk and pray in meeting are just as likely to be caught in some disgrace along this line as any other; yes, and some of the enemies of Christ Jesus say they are *more* likely. They tell us (and we can not altogether deny it) that even our *ministers*—especially our revival ministers—are notorious for having favorites among the opposite sex, especially during revival times. Why, the very *thought* of it is awful. Let us hope that this thing belongs more to the exciting revival seasons of times past than to those of the present day. Then there is another feature of this case. When this minister is remonstrated with by his good friends he absolutely denies that any thing of the kind exists or ever has existed. He declares unblushingly that his inmost thoughts are free from it in the sight of God; but when he is advised to shun even the *appearance* of evil, and to keep entirely away out of *sight* as much as possible of the one who is talked about in connection with his name, in a very little time the two are found together again. He explains it by saying there were “peculiar circumstances” of such a nature that the thing absolutely *had* to be talked over, and explanations made. Poor silly fool! No, I have got it wrong. I should say a *pair* of poor silly fools. Satan has so blinded their eyes and bewildered their judgment that they have not even common sense—no, not even the commonest kind of sense—and the thing goes on—that is, unless the friends of the parties have the good sense and wisdom to see there is no other remedy for either Christian or sinner than to get them away from each other. If the man is sent off to another parish he may be all right the rest of his life. He *ought* to be, on the principle that a burnt child dreads the fire. If the distance is not great, however, Satan does not let go. He manages, by some hook or crook, to get up an excuse so that one or both of the parties shall bridge the distance. God knows how it pains me to go over this thing; and I would not do it were it not for the hope that I may be enabled to hold up a warning. I have had a man look me in the face, and declare before God that no such thought as I had suggested had entered his heart, and I was over-persuaded by friends all around me to try to think the man told me the truth. Only a few weeks after, he admitted he was getting a divorce from his wife as fast as he could, and then he was going to *marry* the girl. I have heard men tell falsehoods when they were crazy with strong drink,

and I tried to excuse them because their will power had been sinned away, and they were hardly responsible for what they said or did to satisfy the appetite; but I almost feel that the drinking man has more sense and *conscience too* than this *other sinner* who *may be* at the time a *temperance lecturer*. But there is another trouble with this sort of sin. You can say to the intemperate man, "Behold the Lamb of God that taketh away the sin of the world." You can say it to him because he does not make any profession; but how can you say to this other man, who is daily preaching Christ Jesus (or pretending to), and exhorting sinners to repent—how can you say to him that Christ Jesus is the remedy for any sin or *all sins* that beset mankind?

Every little while of late we see notices in the papers of action for damages commenced against certain persons for "alienating the affections" of a wife or a husband as it may be. We gather from the reports that the laws are pretty severe on the offenders in this line, and they ought to be. Many people, no doubt, smile at this thing as utterly ridiculous; but, dear friends, do not be too sure. It may, like the smallpox, or like lightning from the sky, strike into a neighborhood or locality where you least expect it. While considering this thing we may say, "How can any man or woman be such a fool, or be so silly, as to be 'beguiled' by anybody, no matter how smart?" Let me say again, do not be too sure. A man does not have to be very smart nor very bright to discover, if he sets himself seriously about it, that he may find silly people almost anywhere. Satan is a good trainer. He goes to work deliberately, and takes plenty of time. He suggests to his victim, "You have money and influence. You can take this person into your employ, pretending you need just such a one." The only thing that Satan wants is to find somebody who will stoop *low* enough, degrade his manhood, and listen to the teachings of this wily "serpent" we are told about in the third chapter. Satan's work is in enticing sinners, and *sin* finally is much the same in the end, whether it be drinking, gambling, or *beguiling* some unsuspecting one who might never have had a wrong thought if left alone. Adam and Eve, even in the garden of Eden, had to be tested and tried; and you and I, dear friends, must in some manner be tested and tried before we can really be *soldiers* of the cross. May God help us to be ready in the *very outset* to say, "Get thee behind me, Satan."

Stratton Mfg. Co., Box 54, Erie, Pa.

A FRIEND to poultrymen—to chickens.

Adam's GREEN BONE CUTTER

It runs easily because it has ball bearings. It cuts clean, quickly and perfectly. Makes a fine bone shaving such as chickens require. Before you buy send for free catalogue No. 39.

W. J. ADAM, JOLIET, ILL.

Why Successful!

Doesn't it vex you, after ordering "one hive nailed up and painted," to get one all colors of the rainbow, bodies and supers not square, covers don't fit, frames crooked, one nail where two ought to be, etc.? That doesn't happen here, because the **Bee Supplies and Honey Business** is the only iron we have in the fire, and we know how to keep it from burning. We are practical, and can advise you correctly when you don't know just what you want. We don't sell "stickers" or fandangled paraphernalia to get your dollars, because we want you to come again. We sell the best hives and supplies at manufacturers' prices. Service and shipping-facilities perfect.

Our Standard-bred Italian Queens are the quality. Orders booked now for, untested, 75c each, 6 for \$4.00; select tested, \$1.50.

New 1902 catalog free.

The Fred W. Muth Co., Front and Walnut, Cincinnati, Ohio.

Queens You Should Have

Does blood tell in other stock? Give your bees a chance. Stock used for breeding the queens offered—not from a sport, but my pick out of an apiary giving last season an average yield as follows:

Honey Gathered.

102 lbs. extracted and 68 lbs. comb honey per colony besides increase and stores for winter.

Quality of Comb Honey Produced.

"Man! It would dazzle you."—Wm. McEvoy, Ontario Government Inspector of Apiaries.

Wintering Qualities.

Up to the present, January 30, I never found these bees to show the least indication of unrest—always perfectly quiet. They are wintering perfectly.—Frank T. Adams, Brantford, Canada.

General Commendation.

Out of those queens you sent me I have produced the best race or strain of bees I ever owned. Remember that is saying a lot, as I have tried every breed imported to this country. The bees winter better, build up, and stand cold chilly winds in spring better, and are more suitable than any bees I ever owned. For the season they gave me about double the honey the pure Italians did, and more increase. Glad you are going into the queen business, and are going to join our ranks again. We are much in want of a few men like you. C. W. Post, Ex president Ontario Beekeepers' Association (owns 365 colonies).

S. T. Pettit, Canada's most successful comb-honey producer and bee-keeper, says: "The blood in my apiary is largely the progeny of queens sent by you, and they are grand bees."

Prices of Queens.

They are duty free to the United States. Tested, \$2.00 each; \$10.00 for 6; \$18.00 per dozen. Untested until July 1st, \$1.25 each; \$7.00 for 6; or \$12.00 per dozen. Same after July 1st, \$1.00 each; \$5.50 for 6; or \$10.00 per dozen. Larger quantities, prices on application. Postage stamps taken for fractions of a dollar. To be fair to every one, no selected tested queens are offered. Every one has the same chance. The above queens are bred from a careful selection of Italians and Carniolans. Pure Italian and Carniolan queens same price. Price of full colonies on application. Orders booked as received, and filled as quickly as possible. Order early. Address

Write us or our Western Agents,
Hendon & Hubbell, Chicago, Ills.

The new and revised edition of Facts about Bees, fully describing the Danzenbaker hive and system of producing comb honey, will be ready for mailing in a few days. They may be had by applying to Francis Danzenbaker, Box 67, Washington, D. C., or to us.

COMB HONEY.

When in need of comb honey let us supply you, as we have a large stock to select from. Our stock of extracted is very low, and we shall be pleased to get samples and prices from those having choice extracted for sale.

BEESSWAX WANTED.

If you have any beeswax to sell let us hear from you. We need it now more than we shall next June. For a number of years a great many shipments of wax have been delayed too late in the spring. Some hold it anticipating a rise in price, and others do not get around to making shipment as promptly, perhaps, as they might. In order to stimulate early shipments we advance the price we pay to the highest point it has reached in years, and is likely to reach this year. We will pay 24 cents cash, 30 in trade, for average wax delivered here, until further notice. Be sure your shipment is marked so we may be able to identify it among others on arrival. Write us when you ship, giving the gross, tare, and net weight shipped. If you ship in a box, see that it is a strong one well nailed. If you have enough to fill a barrel, that makes the best package to ship in. If you ship a sack it should be double, and extra strong. You can better afford to be careful in shipping than to lose several pounds on the way.

Special Notices by A. I. Root.

COW PEAS; ADVANCED PRICES.

We have only the Wonderful and Extra-early Black-eye. Price of Wonderful, 1 qt., 12 cts.; by mail, 15 cts. more; peck, 75; $\frac{1}{2}$ bushel, \$1.35; bushel, \$2.50. Extra-early Blackeye, $\frac{1}{2}$ more than above prices.

This latter will ripen seed almost anywhere in the North, but it does not produce anywhere near as large an amount of feed, either for stock or to turn under. Both kinds will, however, produce sufficient bloom to furnish considerable quantities of honey in favorable localities. Leaflet mailed on application.

SEED POTATOES—REDUCTION IN PRICE OF NO. 1 BY THE BARREL.

We have reduced the price on our first-quality potatoes by the barrel from \$1.00 to \$3.50. Prices by the bushel and less will be the same as given heretofore. Price of seconds will be \$2.00 per barrel, as heretofore. Those who have paid us \$4.00 per barrel, either last fall or during the winter, can have a rebate of 50 cts. per barrel if they will give us notice of the fact.

Our seed potatoes, seconds, of Triumph, Bovee, and Sir Walter, are all sold out. We have, however, plenty of both firsts and seconds of all the other kinds mentioned on page 73, Jan. 15.

A DOLLAR POULTRY-BOOK TO EVERYBODY WHO SENDS US \$1.00 FOR GLEANINGS AND ASKS FOR NO OTHER PREMIUM.

This book is the same thing we have been selling largely for several years past. All things considered, I do not know but I should recommend it as being the best poultry-book we have. But this edition we give away is printed on cheaper paper, with heavy paste-board covers. The covers, however, are embellished with pictures of poultry in bright colors, making it a most attractive book to have around. By taking a large quantity we get them of the publishers at a very low price, with the understanding they are to be given as premiums only to our subscribers. They are not for sale at any price. The book contains 322 pages, and is full of illustrations. Remember, everybody who sends us \$1.00 for GLEANINGS, past, present, or future, can have the book by asking for it, and sending postage, which is 6 cts.

JAMAICA SORREL; DID ANYBODY SUCCEED WITH IT?

We did not succeed in getting any "fruit" from our Jamaica sorrel last fall, although we had great sturdy plants two or three feet high. Perhaps we gave it too rich soil, and it grew with too much luxuriance to blossom early. No doubt the trouble was it was not started early under glass as we start tomatoes. Just now, Feb. 7, we have some plants up and growing nicely in the greenhouse. Will those who tried Jamaica sorrel please report? We have some seed left, at 5 cts. a packet. I am anxious to know whether it can be grown in the Northern States as well as in Florida.

THE PRIZEWINNER FIELD BEAN.

I have told you that in 1900 I grew of this variety two crops of mature dry beans on the same ground in one season; and the second crop was from the seed gathered from the first crop. I do not know how many days it was from the time of planting to the mature ripe seed. Last year I sent a few of these beans up to my Michigan ranch, to be planted. I find the letter was written May 22. My boy must have planted the beans near our "cabin in the woods" very near the first of June—may be a day or two sooner. There was a row perhaps two rods long. My neighbor, James Hilbert, wrote me as follows, Aug. 28:

I was surprised at the peach-trees and beans. Those two rows of beans that are by the house are just loaded. An acre like that would just sell out 40 bushels; they are almost ripe. I am going over and gather them when ready, then I can sell you some "seed beans."

I wrote him at once to gather all there was dry enough for seed, if he wanted any, and he did so, probably, about Sept. 1. From the above we gather that these beans, from the time they were planted until they were dry enough to gather, were only just about 90 days in growing, and this in the comparatively cooler locality of Northern Michigan. There has always been trouble there about getting beans to ripen before frost or wet weather; but with the Prizewinner there certainly can be no trouble any seas n. Mr. Hilbert gathered about a peck, and Mrs. Root and I picked a good many afterward; and I still say, as I said the year before, they are the best table bean, to my notion, there is, not even excepting the limas. They are also the best yielder for a field bean I have ever tried, both here in Ohio and in Northern Michigan.

We expect to plant a lot of them around that cabin in the woods. So far as we have tried them, they bear planting very thick in the row. I do not think those I have mentioned could have been more than two or three inches apart. Our boy planted them as he would early peas. From one single stalk we shelled out 152 dry beans, if every stalk had yielded like that, we ought to get 150 bushels from one bushel planted.

As there has been a big demand for the bean ever since it was brought out, the price is still pretty well up. We have secured, however, ten bushels of seed which we will sell as follows: $\frac{1}{2}$ pint, 8 cts.; pint, 12; quart, 20 (by mail 24 c); $\frac{1}{2}$ peck, 60; peck, \$1.25.

THE FLORIST'S MANUAL: A NEW BOOK ON FLOWERS AND GREENHOUSE MANAGEMENT.

I have just been made happy by getting hold of a magnificent volume of 225 pages, 9x11 $\frac{1}{2}$. The book is full of pictures, sometimes several on a page, and it is planned exactly after the style of our A. B. C. book. It commences with "Abutilon" and ends with "Zinnia." These alphabetical heads name almost every plant known to florists—that is, commercial florists; and there is a splendid picture of every thing of note to be found in the greenhouse. Not only are plants fully described, but all the different operations of the greenhouse; and with all the other good things about the book, the writer is an exceedingly practical man, and has a comical way of telling you how every thing is done, in a way that makes the book interesting to everybody. Let me give you one illustration. I wanted particularly to know about *potting*—potting soils, making cuttings, and every thing belonging to the potting business. Well, when I had hunted the book pretty well through, and turned over to the last part, I found a heading, "Potting." This is what I read: "There is no chapter in this book that I started into with such a relish as this one. It is a treat. It is better than falling off a log." How vividly this brought to mind the time, some 25 years ago, when I was writing the A. B. C. book! There were certain chapters I did not feel just in touch with; and then other things—queen rearing, for instance—that I felt so familiar with I just rejoiced when I got along to that subject. Now, this writer goes on in this same vein of pleasant-

ry He goes over so explicitly every thing about this matter of potting plants, how to do it right, giving his reasons gathered from long years of experience, and sometimes pretty dear experience, that the book actually makes you feel as if you had a kind friend standing by your side telling you what to do and what not to do, and the whys and wherefores; and it is so all through. The only fault with the book that I know of is the price—\$5.00; but the beautiful pictures, taken in some of the finest parks of our great cities, are alone worth \$5.00 to me without any instruction. The book is a specimen of the high-st mechanical skill in the way of half-tones and printing that is in existence, so far as I know. I wish it were in my power to make the book cheaper for our readers who are interested in greenhouses, hot-beds, and cold-frames; but our discount is quite limited from the retail price I do not see how I can do any more than to offer you the book for \$5.00, including GLEANINGS for a year. If you have already paid for GLEANINGS quite recently we will mail you the book postpaid for an even \$4.00, and I think it is worth that for the wife and children to look at just to encourage them in making their own home more beautiful and attractive.

Just one more extract from the book, in regard to having your mind on your work:

You can't talk to a fellow-workman and intelligently and faithfully water a lot of plants in pots, much less syringe them. Your work needs all your thought and attention, and I will conclude this chapter by saying that a man who chatters or smokes at his work is of little use. Work in work hours, give all your mind to your work, and when the noon and evening hour come you will enjoy the rest far better than if you had been discussing your mother-in-law or last employer.

CONVENTION NOTICES.

The annual meeting of the South Dakota Bee-keepers' Association will be held at the City Hall in Yankton, South Dakota, on Wednesday, February 19th 1902.

The Committee is making special effort to make this meeting of interest to all who are any way connected with bees or fruit.

Let all who are interested in bees come and bring a friend with them. By order of

THE EXECUTIVE COMMITTEE.

Kind Words from our Customers.

I have lots of literature on tomatoes, but yours is the best and most practical of all.

WALPOLE NOCKOLDS.

Oakley, Tex., Sept. 21., 1901.

Inclosed find check for \$2.50, for which please credit me with subscription to GLEANINGS for two years, and send me a Post fountain pen. The pen I received of you two years' ago is just as good as new, although I carry it every day, and use it constantly.

Roselle, Iowa, Dec. 16.

I. W. HOFFMANN.

HAND POTATO-PLANTER—ONE MORE REPORT FROM IT.

I got a hand potato-planter of you last summer, and it worked like a charm. I plowed in a heavy crop of grass and weeds so we had to have a chain to pull it in the furrow. Being so much plowed under it could not be furrowed out; but the planter put them in in good shape, although ours is clay land. S. MINCH.

Divide, Oregon, Feb. 15.

Too dry in Iowa for bees. My bees averaged 24 lbs. I have 30 colonies. They are in the cellar. I have wintered in the cellar two winters, and have not lost one colony, and am a green hand with bees. But I had good help in the A B C and GLEANINGS. I like Home Talks. I am thankful to A. I. Root for his talk on tobacco, for it broke me of using it.

Griswold, Iowa, Dec. 20.

W. P. WILLOW-GHBY.

[Thank God for your concluding sentence, friend W. Can we not have some more such testimony?]

I inclose 12 months' subscription to GLEANINGS. Gentlemen, I can not find words to express the satisfaction that I have received by reading GLEANINGS—not only from the amount of information I have received on bees, but from Our Homes. I often feel, when reading them, that I would like to have the

pleasure of shaking hands with Mr. A. I. Root, and asking him to have a cup of tea with me.

JOHN H. JENKINS.

Wellington Gardens, Sandy Bay, Tasmania.

A QUEEN FREE.

Our stock is the very best that money and experience can procure. Just give our stock a trial and be convinced. We will give one warranted queen free in July for every order for one dozen queens before May 1, in order to have you try our stock. Prices: Untested, each, \$1.00; 6 for \$5.00; 12 for \$9.00. Select tested, \$2.50. Tested, \$1.25. Two-frame nucleus and warranted queen, \$3.00; three-frame nucleus and queen, \$3.50. Send for our catalog of bee-keepers' supplies and our price list of Italian queens and nucleus colonies, with description of our strain of bees.

Orders are Now Being Booked

for queens of my improved selected strain of golden Italian business bees. Queens are very carefully reared. We aim to have none but the best. Our old customers stay with us. We use them right. Write for circulars.

J. B. Case, Port Orange, Fla.

If You Want Root's Goods

we have them at Root's prices.—Also A B C in Bee Culture—one of the best books printed on bees. Catalog free. Address as below.

D. Cooley & Son, Kendall, Mich.

1200 FERRETS. All sizes; some trained; first-class stock. New price list free. N. A. KNAPP, Rochester, Lorain Co., Ohio.

Angora Goats

are handsome, hardy, profitable. Prize stock; low price; circular. ED. W. COLE & Co., Kenton, O.

WANTED.—A buyer for my 20-acre tract of land in Benzie Co., Michigan, at \$100 per acre, or \$350 per acre if paid before April 1st, 1902. 100 acres mostly cleared; fine rout-brook; 4 miles from railroad station; 2 miles from church; ½ mile from school-house. Land on nearly all sides of it have found recent sale at higher prices, but I am anxious to sell.

W. A. HOBBS, Traer, Iowa.

WANTED.—Bryan Edwards' History of the West Indies. State year of publication, number of volumes, condition, and price wanted.

A. L. BOYDEN, Medina, Ohio.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co.,

199 South Water St., Chicago, Ill.

FOR SALE.—Extracted honey from alfalfa, in 60-lb. cans, tinted or white, 7 cts. a lb. Also honey in small friction-top pails. M. P. RHOADS, Las Animas, Col.

FOR SALE.—Choice amber comb honey, in 24-lb. cases, at 11c. EDW. WILKINSON, Wilton, Wis.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans. B. WALKER, Clyde, Ill.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, thus: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My nice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present.—M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albinoes, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Fees by the pound, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$3.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,

HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A. No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

CHICAGO.—There has been a decline in the market on comb honey of one cent per pound since the month came in. Best grades of white now sell at 14; sales chiefly at 13½, with some western choice at 13. No buckwheat comb offered, and other dark grades are meeting with little attention; prices range from 9 to 12. Extracted is steady; white, 5½@7, according to quality and what it is gathered from; ambers, 5¼@5¾; off grades, 5. Beeswax wanted at 30.

R. A. BURNETT & Co.,
Feb. 18. 199 South Water St., Chicago, Ill.

SAN FRANCISCO.—No change in prices since last quoted. Raining throughout the State at this date. My bees are at work on alders, willows, buttercups, "Johnnie Jumpers," and manzanita.

Feb. 12 E. H. SCHAEFFLE, Murphys, Calif.

BUFFALO.—Demand for honey is pretty slow, and still there is demand enough to take all that arrives, at the following prices: Fancy white comb, 15@16; A. No. 1, 14½@15; No. 1, 13½@14; No. 2, 12@13; No. 3, 11½@12½. White extracted, 6@7; dark, 5@5½. Beeswax, 28@30.

Feb. 19. 84, 86 West Market St., Buffalo, N. Y.

SCHENECTADY.—There is but very little demand for comb honey. We quote fancy white, 15; No. 1, 13@14; buckwheat, 12@13. There is considerable demand for dark extracted, with no stock on hand. We quote light 6½@7; dark, 6@6½.

Feb. 18. CHAS. McCULLOCH,
1 Eagle St., Schenectady, N. Y.

ALBANY.—Honey market bare of any kind of comb honey. Clover, 15@16; buckwheat, 13@14. Extracted buckwheat, 6@6½. Light demand for light extracted. Beeswax wanted at 30c.

Feb. 22. MACDOUGAL & Co.,
380 Broadway, Albany, N. Y.

MILWAUKEE.—This market does not present any new or very interesting features as regards the honey trade. The very low prices which have characterized the sugar supply, and the good supply of extracted honey, have evidently had an effect on the appetite of consumers of honey, and sugar has dominated the choice, and sweet, sweet honey is behind in the race for the race; yet we advise shipments of comb honey, as the supply of choice is small. We now quote fancy 1-lb. sections 15@16; A. No. 1, 14@15; amber, nominal, 13@15. Extracted, in barrels, kegs, and cans, nominal, white, 7@8; amber, 5@6. Beeswax, 26@28.

A. V. BISHOP & Co.
Feb. 20. 119 Buffalo St., Milwaukee, Wis.

CINCINNATI.—The honey market has been rather dull this year. Comb honey is selling fairly, and brings as follows: White clover, 15c; lower grades, 12½@14. Extracted honey sells very slow, the lower grades bringing 5@6; fancy, 6½@7½. Beeswax, 28@30.

C. H. W. WEBER,
Feb. 19. 2146 Central Ave., Cincinnati, Ohio.

DENVER.—No. 1 white comb honey, \$2.75 to \$3.00 per case of 24 sections; No. 2, \$2.25 to \$2.50. Extracted, 7@7½. Beeswax, 22 23.

COLORADO HONEY-PRODUCERS' ASS'N.,
Feb. 24. 1440 Market St., Denver, Col.

FOR SALE.—Choice amber comb honey, in 24-lb. cans, at 11c. EDW. WILKINSON, Wilton, Wis.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans. B. WALKER, Clyde, Ill.

FOR SALE.—8000 lbs. fancy and No. 1 comb honey. WALTER MARTIN, Globeville, Colo.

FOR SALE.—Extracted honey from alfalfa, in 60-lb. cans, tinted or white, 7 cts. a lb. Also honey in small friction-top pails. M. P. RHOADS, Las Animas, Col.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.50, per case of two 60-lb. cans, net.

ARKANSAS VALLEY APIARIES, Las Animas, Col.

Texas Queens!!

FROM THE

Lone Star Apiaries.

G. F. Davidson & Son, proprietors, have made great preparations for the coming season to accommodate their many customers with either Long-tongue, Imported Stock, or Golden Queens. They have bought out the queen-rearing business of O. P. Hyde & Son, of Hutto, Tex., and by buying more bees and increasing their number of nuclei, they are better prepared than ever to cater to the trade of the bee-keeping public. One of Root's Long-tongue Breeders; Imported Stock direct from Italy; Goldens from leading queen breeders. Fine breeders of each of the above have been added to their yards. Safe arrival and satisfaction guaranteed. Send for queen circular and price list. Address

G. F. Davidson & Son, Box 190, Floresville, Tex.

Do You Need Early Queens?

We can supply you from a fine strain of Italians which has no superior. Choice tested queens by return mail, \$1.00 each. Satisfaction guaranteed.

J. W. K. Shaw & Co., Loreauville, Iberia Co., La.

There is money in poultry. See advertisement of Sure Hatch Incubator on page 207.

Satisfied Customers,

and their numerous expressions of the superiority of my queens warrant me in continuing the arrangement of my queen apiaries in 1902 as in 1901. I have watched carefully, and have selected the queens whose colonies gave me the best results in HONEY, for my queen and drone mothers.

Yard No. 1 consists of a combination of the **Root Long-Tongued Clover Stock**, the **Superior Stock** so much Advertised by Hutchinson, and a **Selection of My Own Stock** that I have been Breeding for years, in regard to which I have the following:

Buffalo, N. Y., Aug. 31, 1901.

My Dear Victor:—Queen and nucleus arrived safely yesterday; made entrance to nucleus and allowed them to fly yesterday. Transferred them to a Dovetailed hive this morning, *without smoke, and handled them, patting them on the back*, and I never saw such quiet and docile bees. If their working qualities are as superior as their handling, I am prepared to say you have the best bees I have ever met with, which would include some 25 or 30 different breeders, and all the well-known races.

Yours very truly,

OREL L. HERSHISER.

The colony of one of the queens I have selected for a breeder in this yard gathered right about 400 pounds of honey last season. I have not measured her bees' tongues, but they are ALL RIGHT, LONG OR SHORT.

Yard No. 2 consists of imported Italians, daughters and granddaughters. For further description see ad. later. Testimonials on application.

Yard No. 3—GOLDEN BEAUTIES or 5-banded Italians.

I am now booking orders for spring delivery; first come first served.

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

VOL. XXX.

MAR. 1, 1902.

No. 5.

BEES AND POULTRY have had a somewhat prominent place in GLEANINGS, and now a swine department is added. See last article p. 140.

SINCE READING that wax-worms would not eat into basswood lumber I have met positive violations of the rule, for there was no question about their eating into the wood in many places. Whether they would have done any worse on pine I do not know.

THE DUTY on honey from Canada to this country is $1\frac{1}{2}$ cts. per lb.; but President Newton, of the Ontario Association, thinks it will pay to gain a market here at that rate. If so, then American bee-keepers ought hardly to grumble at a better price of $1\frac{1}{2}$ cts. a pound.

ALFALFA, 150 acres of it in one locality, reported in Canada, p. 151. The question is, does it produce honey there or any other where east of the Rockies? [Yes, I should like to know where there is a field of alfalfa, outside of the irrigated regions, that yields honey. So far I have yet to hear of one.—Ed.]

THE REASON given why drugs will do more to cure foul brood in Europe than here, and why they are more immune to the disease, is that they have had the disease longer, and it has lost something of its force. A disease is likely to be at its worst in a locality where it has never been before.

YE EDITOR, page 139, speaks of being months behind on copy. Well, there's one good thing about that; sometimes they hold on to an article of mine so long that I've nearly forgotten about it, and then I can stand it to read it myself. [Perhaps I had better "let the cat out."] The fact is, it is easier to impose on a friend than on one who might be a violent kicker. There, I guess I will not say any more.—Ed.]

I WONDER how much I could collect from the A. I. Root Co. if I should sue them for damages because they did not sooner get out the German wax-press. Since using one I feel sure that, for want of it in past years, I have suffered no little loss. [We had asked the doctor to criticise and smash the machine if he could. He may tell a different story later.—Ed.]

"OCCASIONALLY a cluster appears slightly active, but the next time this is quiet," says R. F. Holtermann, p. 152, about bees in cellar. I've often wished I had the leisure to spend 24 hours in the cellar listening to the bees. I think I've had some evidence that each colony has its stated spell of activity, "turning over in bed," if you please. [It almost seems that our bees under the machine-shop never "turn over in bed." See editorials.—Ed.]

PLEASE ALLOW a remark by way of appendix to a reply, page 155. When, at the beginning of the harvest, a colony which has had two stories is reduced to one story for brood, with plenty of storage room above, and the eight combs fullest of brood are left, the queen is by no means greatly restricted. She has the whole of eight frames to lay in, and that is likely to be as much as she would occupy after the harvest begins, even if she had two stories. She may swarm, but hardly on account of the reduction to one story.

NOWADAYS the bellows of smokers have grooves cut in the boards to make them easier to hold. So far, good. But the rounding edges leave something to be desired; and if you want entire satisfaction take W. L. Coggs's plan and nail on a little cleat $\frac{1}{4} \times \frac{1}{8}$ or $\frac{1}{4}$ square. That sharp edge is what holds, so there is no danger of the smoker dropping out of your hand. [I do not know how dauby you let your fingers get; but if one allows them to get smeared much with honey it is almost impossible to get a good grab on any thing. I take it that you have slippery hands when you handle a smoker. Say, doctor, if you can not find a pail of water handy, rub your fingers in the dust a little bit. That is the way

the Californiites do, and that is the way I had to do when I turned in and helped them out on extracting on one or two occasions. Smoker cleats—yes, I suppose they might be a help for “slippery fellows” like you and Coggs shall.—ED.]

G. M. DOOLITTLE says, in *Am. Bee Journal*, to allow 10 cubic feet for each colony in cellar wintering, which is probably right. I have now 235 colonies in a room which allows 9½ feet for each colony when the door is closed. Except in very cold weather, however, the door is open into the adjoining room, which gives each colony 15 cubic feet. [We do not allow that amount in the room under our machine-shop; but we secure in effect the same results by having doses of fresh air administered just often enough to keep the air sweet and the bees quiet.—ED.]

IN REGARD to making nominations for Directors before election, why not let well enough alone?” page 144. That’s just it, Bro. Elwood. I’ve been a Director ever since the first organization of the old Union; and unless I murder some one I’m pretty sure of the office as long as I live. You see, no matter if three-fourths of the voters would rather have some one else, without any previous nominations there’s no chance to agree upon any one, and I’m sure to win out. But say, Bro. Elwood, you’d better keep mum, and not let the thing be talked up, or I may yet lose my job.

THE CALIFORNIA ASSOCIATION, according to a report in *Am. Bee Journal*, has 11 members with 9000 colonies, and 48 members enter the National in a body. Something must be done to keep those California fellows under. [We of the East do not need to do any thing to keep these “fellows under.” The long-hoped-for rains have not yet come, although they had little spurts a few days ago. Their honey will not be much in evidence next year unless it is last year’s held-over crop. Poor fellows! They have got misery enough without us Easterners wishing them any thing bad.—ED.]

IN ANSWER to a question, p. 136, it was Langstroth, beyond all doubt, who gave us the first practical movable frames, and just as truly as he invented them did Dzierzon really invent movable combs. [But is it really and truly settled that Dzierzon invented movable combs? If I remember correctly, when the matter was up there were several others who held priority. But undoubtedly Dzierzon did bring movable combs into use. Marconi, perhaps, did not invent wireless telegraphy; but he so perfected the inventions of others that what was impractical and useless is one of the successes of the age—a wonderful success.—ED.]

WM. CRAIG sends me a honey yarn that is the heaviest yet. The *Detroit Tribune* quotes it from the Durango, Col., *Herald*. With steel drills and blasting powder they are *mining* the honey, for there are “probably 4,000,000 pounds of honey—honey in

all the crevices, recesses, and holes in the rocks for miles in every direction.” [Such yarns as these are comparatively harmless; but it is the kind that the papers have been rehashing—the old story about manufactured comb honey, that makes us bee-keepers fairly boil with rage. I am inclined to think now that some of the sheets that published this nonsense wish they had never seen a bee-keeper nor heard any thing about manufactured comb honey.—ED.]

“HONOR to whom honor is due.” The “infallible” plan of queen introduction mentioned on p. 9 as the Wood plan turns out, like many another thing, to be nothing new. In that very excellent work written by S. Simmins, entitled “A Modern Bee Farm,” the plan will be found given on p. 160 of the 1893 edition. Mr. Simmins also emphasizes the importance of giving to the queen only honey from the same hive. Tardy credit should also be given to Mr. Simmins for the idea of bleaching sections white, which may be found on p. 139 of the same work. [I think you are correct; and when the article appeared I thought there seemed to be something about the method that was familiar, but I could not call it to mind then.—ED.]

BRO. A. I. ROOT, p. 156, says some folks think there is no personal Devil. If such a person is lacking anywhere, I assure you it’s not “in this locality.” [Say, doctor, do you believe this is a question of locality? I think I have run across him everywhere I have been in the United States. Perhaps I did not see his visible tracks, but if I remained long enough I could find traces of him. Do you know that, while I was away, I made a *business of visiting saloons*? Yes, I went into all I could find or had time to visit. As I was a stranger I could go around unmolested, and see just how his Satanic Majesty manages to catch his victims. And if any one thinks there is no personal Devil I wish he would go through some of the western saloons. There are too many people in this world who are utterly ignorant of the awful iniquity that is concocted in these hells of Sodom. I make the recommendation that some of our friends who are indifferent to this temperance question just make a run through the drinking-places at night in any of our “wide-open” cities. They will then think there is a Devil sure.—ED.]

Columbia greets Germania's prince
With friendly hand and true;
We've naught to fear when crowned heads hail
The red, the white, the blue.

That song for bee-keepers, music by G. W. York, words by Eugene Secor, “Buck-wheat Cakes and Honey,” was received

just as the familiar thump, thump, thump of the family batter-paddle was doing its work in making such cakes, rendering the song very appropriate. It is good all through, and all who have music in the house should have a copy.

REVUE INTERNATIONALE.

In speaking of the difficulties of bee-keeping in Tunis, Africa, Mr. Bourgeois paints a picture that throws Arizona in the shade. He says the work is very hard and long. One has to construct a cabin, or barrack, make foundation, hives, fill them with bees, etc. If he has bread to eat he has to go 12 miles for it; wine, 16 miles; fresh vegetables, 38; fresh water can be had only by going several miles for it. He intends to install 1000 hives during a period of three years, the estimated expense of which will be about \$4640. He has rented about 1900 acres for this purpose. The principal sources of honey will be heather and a plant called in French romarin, the latter of which is spoken of in another paragraph.

Concerning a new treatment for foul brood, Mr. Edmond Bochaty says:

"Having noticed last summer in Tunis, where I was managing an apiary of over 500 hives, that, during the blooming of romarin, an abundant and very mellifluous plant, the condition of several foul-broody hives was noticeably improved, I conceived the idea of treating the disease with the essence of romarin, well known for its valuable antiseptic qualities. The results obtained in Tunis by this new process were excellent; and to convince myself of its efficacy, after my return to Valais I applied the treatment to three foul-broody hives. At the end of three weeks, although the disease had gained a strong foothold, it was not possible to find a single diseased larva in those hives. The cheapness of the essence of romarin, which one can find at any drugstore, and the ease of applying the remedy (you have only to pour 15 or 20 drops of the essence every 3 or 4 days in the corner of a hive to effect a complete cure) will admit of every bee-keeper trying this plan."

This plant is known in English as rosemary. It belongs to the mint family, and is certainly a powerful disinfectant.

I guess nobody in Europe will feel hurt if it is said that Mr. Ed. Bertrand's journal is the greatest representative of the bee industry in Europe. Among those in the same rank I would mention *Le Rucher Belge* and the late C. J. H. Gravenhorst's *Illus. Bienenzeitung*. Regrets having been sent in relative to Mr. Bertrand's ill health and probable retirement from work, he says, in his January issue: "Several have expressed regret at seeing the journal no longer in my hands. They are wrong in

supposing I have less to do with it than before. . . . I remain at the head more than ever; and my health being better, thanks to God, I am still permitted to be the director of my editors. With this in view I have the pleasure of announcing that the son of Mr. Charles Dadant, who for a long time has participated in the work of his father and that of the bee-keepers of France and Switzerland, and who was a delegate from the United States to the Congress of Bee-keepers in Paris, in 1900, will henceforth take a part in the regular editorial work of the *Revue*. The bonds that have already united the *Revue* to the name of Dadant are well known. This new and intimate collaboration, which will be aided by the counsels of the senior Dadant, will permit us, among other advantages, to follow closely the bee-keeping movement in the United States."

In reviewing Mr. Reidenbach's celebrated treatise on foul brood, Mr. Ulrich Gubler says:

"This work is the result of numerous experiments, and shows a very profound study of antiseptics. Without knowing any thing about the labors of his predecessors, he arrives at very nearly the same conclusions; but he introduces, nevertheless, a new element in this important question. In the salivary glands of the bees and in the larval food there will be found a substance of which no author has yet spoken; and that is, tartaric acid—an antiseptic of the highest order. According to him, the royal jelly contains from 3 to 4 per cent of it. This acid is transformed in the cells into formic acid. Bees fed on honey produce of it, according to the author, much more than those fed on sugar syrup. For this reason the former are much more able to resist the ravages of foul brood than the latter, which are easily affected. Mr. Reidenbach says the bacillus of foul brood has not yet been determined, and do one has as yet undertaken its culture. This is an error. Mr. Harrison has made a culture of *Bacillus alvei* in jelly, in gelatine, and different kinds of broth, and he has determined its size very accurately."

This has been done many times in this country.

IS PURITY THE CHIEF ESSENTIAL WITH THE HONEY-BEE ?

The evening mail brought a letter from a man in the northeast corner of the United States (Maine), he desiring a little chat with me on the purity of bees, he beginning the conversation with me something after this fashion:

"I see much in the bee-papers about the purity of bees. What do you think in the matter?"

"Yes, much has been said in the years that are past about a standard of purity for our bees; and some of the practical bee-keepers of the country have been led to ask the question, 'Can we adopt a standard of purity that will always secure to us the best working qualities in our bees?'"

"Did they receive an answer?"

"I do not remember any one fully answering that question in print; but I remember one of our most practical men saying in a bee convention once that he could see that it would be easy for those who follow nothing but queen-breeding as a business to adopt a standard of purity, or secure something which would be called thoroughbred at least. But he thought that, for the rank and file of the honey-producers of the country to adopt the same standard, would be quite another thing."

"Why did he talk like that?"

"I do not know that he told the *why*; but I suppose his reason was that the workers from different queens of the same color and general appearance show a vast difference as to their working qualities."

"Has such been your experience?"

"Yes. And I think the same has been the experience of hundreds if not thousands of others."

"Will you tell me something of this experience so that I can understand how you have worked, and from this gather a course of work for myself?"

"I did not pay very close attention to the improvement of my bees until the year 1877. That spring, when changing a colony from one hive to another I noticed a very fine-looking orange-colored queen, with the workers all well marked. A neighbor, who happened to be present, remarked that he would prefer a darker-colored queen for business, and I agreed with his decision. No further notice was taken of the colony till just before July, when nearly every other colony in the apiary had swarmed but this one, and so I went to see why it had not swarmed, as it seemed fully as strong in numbers as the best of those which had cast swarms. This revealed about sixty pounds of section honey all ready to come off, while scarcely another colony had a single completed section."

"No wonder they had not swarmed. But did they not swarm that year?"

"Yes, July 3d they sent out a very large swarm which was hived in a separate hive. But that was all the swarming it did, although I never cut any of the queen-cells in the parent colony."

"What was the result in honey?"

"The parent colony gave 195 lbs. of nice section honey, and the swarm gave 114 lbs., or 309 lbs. from the old colony in the spring."

"Well, that was a wonderful yield, and I judge you thought more of that queen in

the fall than you did when you and the neighbor looked at her in the spring."

"Yes, you are right there. And I thought still more of her the following spring, for both the colony she was in, and that from her daughter, wintered with the loss of but few bees, while many of the other colonies came out spring-poor."

"What did they do the next year?"

"They showed the same disposition not to swarm till late; and from the colony with the old queen I obtained 151 lbs. of section honey, while there were very few other colonies that gave over 100 lbs."

"Did you consider this queen pure?"

"Not fully so. Nor do I consider any Italian queen as pure; but she was so good every other way that I then raised all of my queens from this old one, as long as she lived, and found that, while the majority of them did not duplicate their mother as to color and markings, they did do this very nearly as to their being good in every other way."

"After she died, what then?"

"I now began to procure queens from other parties who reported good honey-yields through our bee-papers, to cross with these bees, as in-and-in breeding was then considered to be very injurious to bees. But the most of these queens did not prove nearly so good as those I had, and so the growth in improvement was very slow, as I had to weed out these as soon as they proved inferior. Occasionally one would prove good, and was used in connection with this strain; but I have kept it very largely in the majority ever since."

"Do you think you have gained any in their purity?"

"No, I should not want to say that; but by this mode of working I have bred up a strain of bees that pleases me, and, after years of getting queens from other parties, I believe them to be second to none as honey-gatherers, although for purity I can give no guarantee, neither do I think it necessary to guarantee any positive purity of stock, except that it be good in every spot and place where you wish goodness."

"Then you do not think that purity of stock is the greatest essential in bees?"

"No. That is not what I am working after. But I am still striving to advance further along the honey-gathering line, so each year finds me securing queens from the most approved sources, although it is seldom I find one I care to use as a breeder; but as this 'seldom one' is of great value, I consider myself well paid for all my trouble."

"Then you like to work along this line of improving stock?"

"Yes. There is nothing in all the realm of bee-keeping that gives me more pleasure than does this work of improvement of stock for its honey-gathering qualities; and as we have at this time several of our most prominent apiarists at work on this greatest of all problems to the honey-producer, if perfection can be obtained with bees I

doubt not that America will stand at the head of the list. But I don't believe that that standing 'at the head' will be because of our *purity of stock*."

IN our next issue Rambler will begin his interesting series of articles on Cuba. We have some fine illustrations, and the story that Martin will tell will be an eye-opener.

THE *Rocky Mountain Bee Journal* published at Boulder, Colo., gives evidence of holding more than its own, notwithstanding it is only a year old. Its editor appears to be both a bee-keeper and a printer—a combination that is certainly very desirable. The field for a bee-journal in the great central West is certainly very large; and a good paper, devoted to the interests of the bees, will, as the years go by, find a good strong clientele. It is impossible for one paper, or half a dozen of them, to publish all the newsy items for all localities, with all their climatic differences, in this great country of ours, and GLEANINGS is always glad to welcome any new rival to the field, for there is room for all.

NO HONEY IN CALIFORNIA THIS YEAR.

THE California bee-keepers, especially those in the southern portion of the State, are very much discouraged. That little spurt of rain that I told about recently did not amount to much; and it is almost a certainty now that there will be but little or no honey in California the coming season, as every thing is drying up. What effect this will have on the honey market all over the United States can scarcely be estimated at this time. If California produced last year 200 carloads, and some say 300, and turned a large part of it loose on the East, what will be the effect on the market if next year it can not ship any? Certainly the price on extracted here ought to hold its own and a little more, whether we get a crop or not.

California will be no bonanza this year for bee-keeping home-seekers. The State will have more bee-keepers and bees than it can take care of.

THE PACKING-HOUSES AND THE BOARD OF HEALTH AT SAN FRANCISCO; GRANULATION NOT A TEST OF PURITY.

I LEARN from E. H. Schaeffle, who is, perhaps, one of the strongest champions of pure honey in California, that the packing-houses of San Francisco recently called on the Board of Health and asked to be allowed to add a *small* quantity of glucose to the honey which they put out, because, as they allege, it is not possible to keep the honey

liquid without the glucose. But, fortunately, the Board informed them that this was not possible under the law, and it is well they did, for, as the old saying is, if you give these packing-houses an "inch they will take a mile." If they were allowed to put in a *little* glucose they would make a "mistake" and mix 75 parts of glucose to 25 of honey, and then call it "pure honey."

And speaking of "mistakes," there never was a bigger one than that glucose will stop the granulating of honey. For experiment I once mixed glucose and honey in various proportions, let them stand, and they *all* granulated more or less. Glucose would, of course, remain liquid and show where it had separated from the pure honey. But pure granulated honey often has clear streaks through it just the same as the "doctored" stuff has.

BEES AND FRUIT.

THE following item, taken from the Red Wing, Minn., *Republican*, is one more link in the chain of evidence showing the almost indispensable offices of the bee in fertilizing fruit:

BEES AS PEACH-RAISERS.

At the Oregon station, experimenters forced a number of peach trees into bloom under a glass last November, and introduced a colony of bees into the house, first procuring one tree so that the bees could not get to it. From that tree all the fruit dropped when the stones began to form. From the other no fruit dropped and it was abundant.

I desire to say in this connection that we have quite a lot of leaflets that we are prepared to send out to our subscribers where they come in contact with certain disagreeable neighbors who persist in spraying their fruit-trees while in bloom and killing their best friends, the bees. They ought to understand that they can not afford to carry on so foolish a policy, if they consult their own interests; and if they are men who can be influenced at all by reason, these clippings that we are prepared to furnish when called for will convince them.

THE BIG GLUCOSE TRUST AND HOW IT PROPOSES TO BEFRIEND THE BEE-KEEPER.

FROM several clippings that have been sent in it appears that a new glucose trust is about to be or has already been organized with a capital of 80 millions of dollars, and will be called the Corn Products Co. It will "take care of all commodities made of corn, except meal, hominy, grits, and whisky." But its particular business will be the manufacture of starch and glucose. Several of the items referring to this trust go on to state that it will make an effort to "bring the cost of honey and maple syrup something near the price set by the bee and the maple-tree." This will be interesting if true. The object of this "trust," I trust, is to advance the price of its product. If so, I hope it will make it so high that it will not pay to use it in honey. But there is no likelihood that it will be thus considerate of the honey business.

The glucose interests have always been a damage to the bee-keeper. They reduce the price on what is called bottled honeys, by putting out a "doctored" product that is so vile that it disgusts the general public with *all* honey, good, poor, and bad.

We wish our friends the enemy success in advancing prices, providing that advance has a tendency to increase the value of honey. But our bee-keeping friends will do well to watch their efforts to "bring the cost of honey near the price set by the bee." If they are at this late day doing works of philanthropy they must have reformed. But they haven't, and they can't pull the wool over our eyes either. Glucose may advance several notches, and still be used profitably to adulterate honey.

Strange, strange it is, that, when the majority of the people, the big majority of them, are against the glucose business, laws can not be enacted at Washington and at the State capitals that will stop this nefarious business of glucose-mixing of a paltry few, and palming it off under honest names as pure goods. The trouble is, I suspect, that the glucose lobbyists are much more alert to their interests than the dear public are to the interests of their stomachs. The result is, no legislation in many States has been enacted; and even in one or two cases where good laws have been passed, somehow the very intent of the law is misconstrued by the very people who should see that it is carried into effect.

WM. STAHL ON SPRAYING FRUIT-TREES
WHILE IN BLOOM.

In spite of all the evidence furnished by the experiment stations all over the United States, and of private experimenters, showing conclusively that the spraying of fruit-trees while in bloom not only kills the bees, but is damaging to the best growth of the young fruit itself, Wm. Stahl, an extensive advertiser of spraying-outfits at Quincy, Ill., who is cognizant of these facts, is *still* sending out circulars urging every one to spray his trees *while in bloom*. By some misunderstanding in our office his advertising card was inserted in our columns; but as soon as I saw it I had it dropped out, and informed the advertising agency that we would not take his advertisement again under any circumstances or at any price.

Mr. Stahl has had any amount of evidence put before him, yet he persists in putting out, through thousands of circulars sent broadcast, advice that is hurtful to bee-keepers and fruit-men alike. None are as so blind as those who will not see. Stahl is offensive to bee-keepers in another way. He put out a statement to the effect that comb honey is manufactured. The animus of such a statement seems to be that he "has it in" for bee-keepers.

If I know the feelings of our readers, when they want spraying-outfits, they will buy of some one who does not openly and flagrantly run against their interests. As

publishers of GLEANINGS we regret exceedingly that his card ever found its way into our columns.

THOSE BEES UNDER THE MACHINE-SHOP.

HERE it is, very close to the first of March, and the bees under the machine-shop are still doing well. The number of dead from the 250 colonies so far during the whole winter, if swept up, would not fill a four-quart measure. Yesterday, Feb. 23, it was quite warm outside, and I went into the cellar to see how the bees were behaving. The door was wide open at one end, letting a flood of light in. The thermometer showed a temperature of 50; but so quiet were the bees that they did not even venture out. The cellar bottom, as I have before explained, is bone-dry; and the air in the room where the bees are is sweet enough for a human being. The winter has been so severe outside that we put in 50 more colonies from outdoors. Yesterday we noticed a few slight traces of dysentery from the bees in the yard, but in the cellar there is nothing of the kind that can be seen.

In our next issue I hope to present you a photo of the hives and the general arrangement of the cellar where they are located.

WANTED—A FOOL-KILLER; THE EFFECT OF
THE COMB-HONEY LIES.

THE following, from one of our subscribers, emphasizes what I have been trying to say right along—that, in spite of all the write ups and the retractions we have secured in some of the standard papers, perhaps three-fourths of the general consumers throughout the United States still believe that honey-comb is manufactured, filled with glucose, and capped over by machinery. So persistently has this lie been put before the public that it is going to take a long campaign of education to get the truth back into the minds of the people. Mr. Jones states a condition of affairs that I am afraid is only too true all over the United States in many localities. He writes:

Mr. Root:—Will you please send me a few of your cards on which you offer a reward for artificial comb honey? You would hardly credit it, yet it is a fact, the maia has struck this section. With your offer of reward, some missionary work may be done; still, it is hard to make them believe even then. I don't know but a wiser and more effectual remedy for the evil would be this: You send us a strong, hearty young fellow who would accept the position of "fool-killer" for this neighborhood and turn him loose to perform his office. As to salary, if he will do piece-work, and is industrious, surely it will amount to something munificent.

For mercy's sake, just look at this: Bartlett Springs is a fashionable health-resort. The very elite of San Francisco make it their summer home. Last summer a bee-keeper took there for sale a lot of honey. It was in sections, and would grade "fancy" and "No. 1." Did he sell it? No, sir—not one pound. "We don't want that kind of honey—you can't fool us," etc., *ad nauseam*. Did the bee-keeper urge it on them, and endeavor to explain? No, indeed, he did not, for he was a man "wise in his day and generation." What he did do was to go off and hunt up a lot of old rusty empty coal-oil cans, cut his honey from the sections, mix in a few leaves, rotten wood, etc., *womox* it all up in a mess, make some change in his own appearance, and go back with a lot of "wild honey" for sale.

Why, they just crowded one another to get to it. He couldn't weigh it out fast enough. "O Mrs. Newrich! is not this delicious?" "Why is it, Mrs. Goldbug, that we can not get such things in our markets?" "I can taste the very aroma of woods and wild flowers." "No glucose and paraffine about this," and so they went on until he had sold his last pound. Now, these are not ignorant people. They are the very best that we have—at least they are representative, and they believe it. I can see no solution to the problem unless the great dailies, the makers of public opinion, can be induced to take the matter up, and editorially show its glaring absurdity—either that or send out the fool-killer.

H. B. JONES.

P. S.—Since writing this I am struck with my own idea; and, to act upon it, I will at once write to the *Examiner*, of San Francisco, and endeavor to enlist them on our side. If they will take it up, all the Hearst newspapers will do so, and that means New York, Chicago, and San Francisco. Those papers do nothing in a half-hearted way, and what they undertake to explain will be ventilated thoroughly.

Arbuckle, Cal., Jan. 20

H. B. J.

Our readers are respectfully requested to keep up their campaign of education—that is, of letter-writing, sending articles to local papers, and telling the truth about their business, and showing that comb honey is not manufactured and can not be.

HOW TO CLEAN NEGATIVE GLASS.

MR. F. A. SALISBURY, seeing the editorial on p. 58, Jan. 15, corrects me by saying that my directions for cleaning negative glass would not lead to very satisfactory results, and then explains his method.

Mr. Salisbury says that it is very simple. He uses a common wash-boiler, and places in it two pails of water and a pound package of Babbitt's potash. After the water comes to a slow boil, he is ready to place the glass in. But instead of immersing it in bulk in every shape imaginable, it must be placed on wooden racks so that the water can get at *both* surfaces of *each* light of glass. For that purpose he uses a pine board 3 in. wide, and just long enough to go inside of the wash-boiler. Into this he drives 8-penny casing nails about $\frac{1}{4}$ of an inch apart, zigzag, the entire length, and deep enough so they will stand up $1\frac{3}{4}$ inches. See diagram. Wooden handles are

nailed on to each end. The lights of glass are now stood up on edge between the nails, and the whole is immersed in the solution of potash. It is then left there for about ten minutes, when it is lifted out and soused down into a tub of water to rinse off the glass, for the photographic film will all have dissolved off in the solution.

To expedite the work, three wooden racks for holding glass are made; and if one works right he can take 50 every 5 minutes, and have 2 minutes' rest out of each 5. When the rack is taken out with the glass it is set on the inverted boiler-cover and carried over to the tub. This catches the drip.

BEE OR MACHINE HONEY.

WALTER S. POWDER has been doing some good work in replying to certain articles

that have appeared in the *Indianapolis News*, a daily paper of wide circulation and much influence. It not only published Mr. Powder's letters, but one from myself. The result is, the readers of that paper are probably pretty well advised by this time that there is no such thing as manufactured comb honey. Mr. Powder, in speaking about the condition of the market as the result of these comb-honey canards that have been afloat, writes:

The honey business is dull, and it can be attributed to nothing but the newspaper stories. We learn this from conversation with those who come here for honey. Many ask if this is bee honey or machine-made honey. Others ask if this is pure comb honey or fed honey. In one case I explained to a man that there was no machine-made honey and he replied, "Well, I don't know about that. I have just learned that I have been eating manufactured eggs all winter." Another man said that he once knew of a place in Indianapolis where they made comb honey by machinery. On further inquiry he referred to my old shop in Walnut Street, where I was located some years ago.

WALTER S. POWDER.

I am afraid that Mr. Powder, when he tells us that the "honey business is dull," comes pretty near hitting the truth—especially when he attributes that dullness to the lies that have been circulated. We find in our business that the demand for extracted honey is good, while comb honey is of rather slow sale.

Before the onslaught of lies there was a certain steady demand for comb honey. Now, why is it that that demand seems to have eased up *just at a time* when honey ought to find a fairly good sale? I tell you, brother bee-keepers, there are thousands—yes, millions—of people who *still believe* that the greater part of the comb honey on the market is *machine-made*; yes, and a few fools who have been eating pickled eggs imagine they have been eating a manufactured article. The campaign of article-writing, telling the truth about comb honey and how it is produced, should be kept up by our friends.

J. K., Minn.—As a rule very little honey is obtained from dandelions. Some have even questioned whether bees get any at all, asserting that pollen is the only thing that they visit the blossoms for. The probabilities are, both pollen and a little honey are obtained. Indeed, I have sampled what was said to be dandelion honey, and it had a very distinct flavor, not unlike the aroma from the flower. But I never knew of a case yet where any considerable amount was obtained. Dandelions grow profusely here, and the only effect of them is to start brood-rearing slightly. Dandelion honey, what little there would be, would not be sufficient to supply the bees with stores if they were short on coming out of winter quarters.

The south side of a ridge or hill would be an ideal place on which to put bees. You need not fear about its being too warm.

TAKING BEES FROM WINTER QUARTERS.

When and How to Do it; Good Orthodox Teaching.

BY R. F. HOLTERMANN,
Formerly Editor of the Canadian Bee Journal.

After careful wintering comes the question of placing the bees on summer stands, and how and when to do so to the best advantage. This is a matter in which the bee-keeper must be guided in part by circumstances. Bees should be kept warm in spring, and doubtless a great deal can be gained by husbanding the heat of the cluster and having the hive close-fitting in all its parts. Let me say that over twenty years of experience in handling bees, the manufacture of supplies, and having now no interest whatever in their manufacture, aside from making the hives for our own use, and to hold the bees we sell, convinces me that the average bee-keeper does not attach the importance and value he should to good hives. The supply-dealer who seeks to provide a good article for his customers, and charge a reasonable profit, has constantly to convince the inexperienced bee-keeper that his goods are worth more than those of a local sawmill, the operators of which often have no idea as to the requirements of a hive, especially as to accuracy. That it will pay in our locality to pack our bees in outer cases after setting on summer stands, I doubt; but that it will pay to give considerably more for a hive, that will afford ample top protection, I am sure. If a bee-keeper has such a hive it will pay to set bees out earlier than when they are not so protected.

To know the best time at which to set out bees requires very careful observation, and is, in a measure at least, partially guess-work. The purer the air of the cellar, and the better the bees are wintering, the longer they can be left in the cellar. If I find certain colonies restless I aim to set these out, also others necessary to move to reach those restless. When are these to be set out? Just as early (in our latitude in March) or quickly as the bees can get a good cleansing flight. Activity exhausts vitality. When the intestines of the bee are charged with excrement, and it becomes diseased, it can not rest; and the longer that condition prevails, the more vitality is exhausted. Under these circumstances the sooner the bees get a flight the better. Even should it be very cold afterward, the bee has disposed in flight of the matter which keeps it restless, and it can settle down quietly in the hive. I have seen colonies so treated do fairly well when those in apparently the same condition left in the cellar perished. However, I gave the bees a warm cushion on top. Top protection is important.

Quite recently, I do not know where, some one advocated taking a colony with dysentery, carrying it some distance from the hive, and shaking the bees in the air; and when those in their flight returned to the old stand they would, in flight, discharge their excrement; and by repeating the operation several times the bees would be cured. Let me say this: I never saw bees restless with dysentery, if it was daylight, remain in the hive if the atmosphere was warm enough for them to fly without chilling, and the shaking-off process appears to me to be quite superfluous.

If the bees are all in about the same condition, what then? Shall they all be set out at one time? I am not an advocate of setting a large apiary out of winter quarters at one time. By that I mean carrying them out one after another until all are out, especially if the day is warm and bright. Why? It leads to confusion. The poorer the wintering, the greater the excitement of the bees during their first flight. Am I an advocate of late setting out? No. From year to year my practice has been to set out earlier; and in this locality, some 80 miles north of Buffalo, if the day is favorable I would begin setting bees out at any time after March 15. Out of 100, set out 7 or 8; and when they have had a good flight put shade-boards over the entrance, and then set out more the next favorable day, and so on until all are out. In no case would I keep the bees in the cellar after the first pollen appears. No doubt, unless the bad air in the cellar prevents, the bees can smell the pollen and nectar, and they will not rest.

Some say the bees that have been set out rob those taking their first flight. I have never found this to be the case. By setting shade-boards in front of those out, and then taking the bees from the cellar early in the day, these latter bees are pretty well over their excitement by the time those having stood in the outside cold with shade-boards over the entrance get stirred up. With successful cellar wintering there is no brood-rearing while in winter quarters. *There is no mistake about this.* Activity means exhaustion of vitality; and when vitality is exhausted, instinct (I call it obeying God's law implanted in the animal) causes the bees to rear brood to replace the exhausted vitality. When the bees are set out they begin brood-rearing; and the more active the bees, the more brood is reared. The days they fly, the queen lays. After several days of quiet she ceases laying; and when one or more days favorable to activity return, the queen again lays. To such an extent is this the case that an expert can tell by the age of the brood in the combs the duration of cold between seasons of activity.

Some complain that, in the excitement of a general flight, the bees intermingle, and the strong attract bees from the weaker. This is undoubtedly true; but by setting out fewer bees this tendency is reduced. I

also strongly favor setting bees on the summer stands very early in the day, or just before it is warm enough for a flight. By so doing, the bees come out more gradually as the temperature rises. There is a slight danger of a change in the weather; but here, as in other places, the experienced, careful, and observing person has some advantage. With good wintering there is no need of changing or cleaning bottom-boards. They should be clean, dry, and sweet; but if there are dead bees on the bottom-board to any extent I would change these after the bees are through flying. With the help of another this can be done very quickly. The sealed quilt should be left untouched, and entrance-blocks should be adjusted to suit the strength of the colony. When bees are set out early, before pollen or honey can be gathered, shade-boards should be placed over the entrance, and taken down only when the bees can fly without chilling. Shade-boards over the entrance will also be found an advantage when bees are likely to fly during unfavorable weather, even when pollen or honey may be secured.

To recapitulate briefly: Set bees out as early in March as they can get a cleansing flight, if they become diseased. If quiet and healthy, leave them in the cellar until the first pollen appears. The poorer they winter, the fewer should be set out at one time. Set out when the indications are that it will be warm and fair, but before it is. Keep in, by means of shade, or even close up those that have had a flight, and might rob those having a first flight.

In closing, let me say I do not know if it is desirable that bees be returned to the stand from which they came. I doubt if it is necessary. By following the points given above, we shall steer clear of that which tends most to draw the bees away from their own hive during the first flight; and to be perfectly safe it is, perhaps, as well to return each hive to the old stand.

Brantford, Ont., Can.

[It may be well to bear in mind that localities vary greatly as to the proper time to set bees out. Dr. Miller once gave the good rule that applies equally to all places, to set out when the soft maples come into bloom. This will usually be about the time when safe warm weather comes on. We shall, however, set our bees out late rather than early. We are liable to have a very warm spell in April, during which the bees will get a large amount of brood started. This will be followed by cold weather during which not only a large part of the brood is lost, but many of the bees, in their efforts to hover and preserve the brood. It therefore seems to me (except in the case of actually diseased colonies) that March 15 is about a month too early for most localities. Last year we did not set our cellar bees out till *after the 1st of May, and those colonies proved to be the best we had.* Of course, if one can't keep his bees quiet he will have to set them out earlier.

Mr. Holtermann is exactly right in advising the setting-out of a few colonies at a time. Indeed, I indorse every thing else he says, except as to the time of setting the bees out.—ED.]

VENTILATION OF BEE-CELLARS.

A Reply to T. F. Bingham.

BY G. M. DOOLITTLE.

[The following article was intended to follow immediately after Mr. Bingham's, to which it is in reply, in our Feb. 15th issue; but it arrived just after our forms had been made up. The reader is requested to turn to page 154, and then he will understand this article a little better.—ED.]

Mr. Editor:—At last our snow blockade is off, and we get our mail again, the first time for nearly a week. You ought to see our roads. Many are the drifts from six to twelve feet deep, and we have shoveled and shoveled till we are all glad to be in communication with the outside world again. One of the good things is that it is not so extremely cold, four degrees below zero being the coldest. With the opening of the roads came your letter, containing proof of Mr. Bingham's article, with your footnotes thereto, together with a stack of mail that will take me days to wade through. I thank you very much for sending this proof, and giving me a chance to say a few words in the same issue.

The discussion now going on relative to this ventilation matter reminds me of the seventies and early eighties, when we were at it "hot and heavy," only a little being said at this time about the "sub-earth" part, which was then thought to be the most necessary part in the matter, the upper ventilator being opened and closed as the temperature of the repository said was necessary; and the opening and shutting of ventilators, as spoken of then, and at the present time, brings back very forcibly to my mind just how I used to run out to the cellar with every change of wind and temperature, else the cellar would be nearly or quite freezing one day and too warm soon after. I followed this for several years, as did scores, if not hundreds, of others, until it began to dawn on my mind that perhaps this matter of ventilation might possibly be overdrawn, and I mistrust that some of those who are now so sure that *ventilation* is the main thing in cellar wintering may weaken somewhat in the matter as time passes into years. With this "dawning" I began to leave the ventilators closed a part of the time, especially the sub-earth one, and found that the bees wintered better than they had at any time before, notwithstanding all the labor I had been to in fussing with ventilators.

The next winter, during a cold spell I kept all closed for two weeks, and found on going into the cellar that the bees were in the nicest condition I had ever seen them up to this time, so I left all closed for another two weeks, when another examination show-

ed that they were in just as nice order as before. I now paid no further attention to ventilators; and when the cellar was newly roofed no provision was made for ventilation whatever. Nor have I seen any reason since for ventilators, so far as the *bees* were concerned, for they come out in the spring much better since I use no ventilation than they did when I was fussing with ventilators as some are now doing.

If you will turn to page 333 of A B C, 1899 edition, you will see that my upper ventilator was not the little one "thirtieth," or "three and four inch ventilator," you speak of in your footnote, but a 6x8 inch ventilator, or one nearly one-fifth as large as your 16-inch-square one you are now recommending. This, together with the large sub-earth ventilator (100 feet long, and at an average of 3 feet under ground) would change all the air in the cellar in less than five minutes. Then you must have forgotten how, with those dry cellars of years ago, the bees got uneasy and noisy, coming out of their hives and running about the entrance till some one found out that the giving of water in a sponge quieted them. And I have often wondered if those having noisy bees, and who opened their cellar doors at night, and shut them in the morning to quiet them, could not do this quieting more quickly by giving a little water in a sponge. My idea is that it is the damp night air which is let in that should have the credit of quieting the bees, more than a change of air. This damp air, together with a cooling of the cellar, slakes their thirst and makes them happy. Away back in the seventies, with my dry cellar and pure air I have given water to restless colonies at night, and found them as quiet as "lambs" the next morning. I have been watching this ventilation matter through the "eyes" of the past, and can only see in it a revival of those days; and as long as my bees winter very nicely, without even one single thought, on my part, as regards ventilation, from the 10th of November to the 20th of April—no, not so much as the opening or the shutting of a door (notwithstanding Mr. Bingham thinks I do this, according to his letter found on page 934 of GLEANINGS for 1901), I do not see any reason for adopting that great big ventilator, nor worrying my head over the matter, and much less of running back and forth to the cellar all winter to see that the ventilation is properly regulated to suit every change of wind and temperature. If the bee-keeper can gain nothing by all of this trouble in looking after ventilators, his time can be much more profitably spent in preparing for the next season, or by reading, recreation, and rest.

And to Bro. Bingham I will say, I would prefer my hives dry, and would prefer less mold on the cellar walls; but if my bees winter as well as his, can he say that his dry sweet air is any better for the *safe wintering of bees* than the dampness which mine enjoy? The experience of the past

has led me to believe that, where a cellar is not overstocked, an *even* temperature of from 44 to 46 degrees, together with a *moist* atmosphere, is one of the *happy* environments, very enjoyable to the bees, and one tending toward their coming out nice and healthy in the spring. At any rate, it winters well with me, and gives me a "happy" winter, free from any care whatever in the matter, and at present I am satisfied to let "well enough" alone.

I had thought to close here; but I have been reading the proof of Bro. Bingham's article over again, and feel that I should say a few words regarding this sentence of his: "A hundred colonies of bees consuming 400 pounds of honey per month, would liberate not less than 35 to 40 lbs. of water per week." I wonder if Bro. B. meant just what that sentence conveys to the mind of the average reader. Or was it put in as a sort of "filling" to make his side appear the nearer right? But whichever way he intended it, this sentence speaks the loss of 1500 pounds of honey, or its equivalent, during the five months the 100 colonies are in his cellar, over and above what mine consume, just for the sake of that dry air and his extra work with that big ventilator. Bless your heart, friend B., if bees must consume stores at the rate of four pounds of honey per month, per colony, for the privilege of being in a *dry, well-ventilated* cellar, then I have an additional reason for sticking to my *moist, no-ventilation* one; for it is a rare thing that any colony consumes more than one pound a month while in this cellar; and on several winters I have had colonies which did not consume more than from $3\frac{1}{2}$ to 4 lbs. of honey during the five to five and a half months they were in this repository. This saving of honey will far more than overcome all disagreeableness which arises from moisture, and leave a large amount on the credit side of the balance-sheet besides.

Borodino, N. Y., Feb. 7.

[This question of ventilation seems to be a rather perplexing one. Our experience is emphatically in favor of ventilation. Our out-yard cellar was not ventilated, and Mr. Wardell has reported it as not doing well, while the bees in our home-yard cellar—that is, the one under the machine-shop—are doing finely. In the former the air is very damp and the ventilation is limited, because I did not notice that Mr. Bingham recommended a 16-inch ventilating-flue, until *after* we had put in the 6-inch ventilator, and the bees were in the cellar.

Regarding the consumption of honey as reported by Mr. Bingham, it appears that our friend must have made a mistake. Conservative estimates have shown that indoor-wintered bees consume about half of the amount of stores consumed by bees outdoors. In some cases the figures are down as low as one-fourth, so that from 5 to 10 lbs. per colony during the five months would be more nearly correct. Mr. Doolittle puts the

figure at 5 lbs., and he is about right, according to our experience, and according to the experience of those who get good results in wintering. I consulted Mr. Bingham's copy, but found the same 400 in his own handwriting, of honey per month for 100 colonies. This makes in all 2000 lbs. of honey, for the five months, when it should be about 500 lbs. for the same length of time. Evidently Mr. Bingham has made a mistake. His figures will be very liberal, even for outdoor-wintered bees. But even taking the figure of 500 lbs. for the five months, that would leave him from 40 to 45 lbs. of water according to the same ratio, or between six and seven gallons for the 5 months. Even this amount, with the moisture from the cellar, would be sufficient to soak the boards of the hives of 100 colonies—that is, providing this moisture could not escape.—Ed.]

A HONEY TRUST.

California and its Effect on the Honey Market.

BY F. E. BROWN,

Manager Central California Bee-keepers' Association.

It is a rule with the honey-buyers of the United States to watch the rain conditions of Southern California; and as soon as the winter rain is reported, then it is that they line up and get ready to "do" the fickle-minded honey-producers of that unfortunate part of this great honey-producing State, and the rest of the world is made to suffer their folly with them.

For instance, at the beginning of the last season's rainfall for this State, the writer was in Chicago, and the honey-buyers had nothing to say regarding honey except that, as California was having big rains, there would be abundance of choice honey that could be bought at a price of 4 cents. I laughed at the idea, and told them that, as Southern California was now well organized, they would probably market their honey from this on; they would smile, and say, "Wait and see." Yes, we did wait and see. Central California, as well as Arizona, held their honey, provided money for the man who had honey who was forced to use the same to get money, and thus the honey was stored, waiting, as we supposed, for the conditions of the honey market to so shape up that we could prove to the honey-buyer that there was no 4 cents this time. After waiting a long time, all the while keeping in touch with Arizona, finding them faithful to their word, holding firm for the living price, Southern California through what was thought to be the Exchange, manifesting the same spirit, all seemingly working quietly on to success, the buyers reported to the California grower that Arizona was selling at 4 cts., and at the same time reporting to the Arizona producers that Central California was selling at 4 cents. These reports had no weight upon us, as

we were posted as to what the other was doing.

Buyers soon began to be indifferent as to whether they had our goods or not, stating that they were getting all they wanted from Southern California at a price of 4 cents. Arizona was told the same thing, but we did not believe it; but suddenly the crash came, like a thunderbolt from a clear sky. A letter from a party controlling 50 or more cars stated that he had marketed, up to date, 22 cars, at a price of 4 cents, and at the same time he advised me to sell what I controlled through him. What were we to do? Southern California, with 300 cars of choice honey, was seeking a market at 4 cts., with a freight rate of 85 cts., while we here in Central California, as well as Arizona, had our 30 to 40 cars, and a freight rate of \$1.10. The jig was up, and we, with our hands tied, were forced to submit.

Now comes Rambler, who wants to form a *trust* for the greater production of honey, and suggests that Southern California be made the hub, the center, the first and foremost. That is just what the buyers would like, as the scheme would work well to their good and gain.

I say, let us have a trust (if it be called a trust) for the protection of the producer, and let its head be away from the coast of the Pacific. Make it national, with the head in Chicago, backed up by every locality in its reach; give them the control of the honey, and allow no locality to dictate prices.

THE BEE IN LAW.

Keeping of Bees; When and When Not a Nuisance.—Article 5.

BY R. D. FISHER.

1. *General Definition.*—The term "nuisance," in legal phraseology, is applied to that class of wrongs that arise from the unreasonable, unwarrantable, or unlawful use by a person of his own property, real or personal, or from his own improper or unlawful conduct, working an obstruction of or injury to a right of another or of the public, and producing such material annoyance, inconvenience, discomfort, or hurt, that the law will presume a consequent damage.

A nuisance may be said to be any thing wrongfully done or permitted which injures or annoys another in the enjoyment of his legal rights. (See Wood's Law of Nuisances, 2d Ed., 1, and Cooley on Torts, p. 565.) It will be noticed that this definition is so broad as to include many wrongs not regarded as nuisances. "Nuisance, *nocturnum*, or annoyance, signifies any thing that worketh hurt, inconvenience, or damage."

2. *Public and Private Nuisances.*—Public or common nuisances affect the community at large, or some considerable portion of it, such as the inhabitants of a town or community; and the person therein offending

is liable to criminal prosecution. A public nuisance does not necessarily create a civil cause of action for any person; but it may do so under certain conditions. A private nuisance affects only one person or a determinate number of persons, and is the ground of civil proceedings only. Generally it affects the control, use, or enjoyment of immovable property; but this is not a necessary element according to the modern view of the law. A nuisance, to be a public nuisance, must be in a public place, or where the public frequently congregate, or where members of the public are likely to come within the range of its influence; for if the act or use of property be in a remote and unfrequented locality, it will not be a public nuisance. A common nuisance, according to English authority, is an unlawful act or omission to discharge a legal duty, which act or omission endangers the lives, safety, health, property, or comfort of the public, or by which the public are obstructed in the exercise or enjoyment of any right common to all the people.

Strictly speaking, a trade or occupation, a business or industry, lawful in itself, and which becomes a nuisance because of its location, or the manner in which it is conducted, or the character of the animals or thing, is not a nuisance *per se*, though it may be a *prima-facie* nuisance.

3. *Keeping Bees—When and When Not a Nuisance.*—Whether bees are or are not a nuisance is to be judicially determined in each individual case, and it would seem that the foregoing definitions were broad enough to include them. Only a few cases have found their way to the higher courts, involving this subject; but with the development of the fruit-growing industry the bee's liberty is more than ever questioned, and it is not unlikely that the future will be conducive to much litigation between the fruit-grower and the bee-keeper.

Place of Keeping Bees.—One engaged in the business of keeping bees may not rightfully keep his bees in a place upon his premises so as to annoy his neighbors. Such an act is a nuisance. One of the earlier cases on this subject was decided by the New York Supreme Court (*Olmsted v. Rich*, 6 N. Y. Suppt., 826), and other courts have been content to follow it. In this case the evidence showed that the plaintiff and defendants were neighbors; that the defendants were keeping a large number of hives of bees in a lot immediately joining the plaintiff's dwelling-house, and that at certain seasons they were a source of great annoyance to him and his family, and also that they could be removed without material difficulty to a place on the defendant's premises where they would not disturb the neighbors. The action was in the nature of an injunction to prevent defendants from maintaining their apiary at the place above named. The court held that the case was a proper one for a permanent injunction. In such action the issue was not as to defendant's motives in

keeping the bees, nor whether they had knowledge of any vicious propensities of the bees, but simply whether the condition of things, as then and previously existing, constituted a nuisance. The court held affirmatively, and the bees were ordered removed in order to abate the nuisance.

On the other hand, an ordinance by a city council which makes the owning, keeping, or raising of bees within a city's limit a nuisance *per se* is too broad, and is, therefore, invalid. The most celebrated case of this kind on record is that of *Clark v. City of Arkadelphia*, Arkansas, 52 Ark., 23. The evidence in this case showed that Clark, who had kept bees in that city for a number of years, was not in political harmony with those in power, and the latter sought to punish him and get rid of his presence by prohibiting the keeping of bees within the corporate limits of the city. Clark was ordered to remove his bees, but refused to do so, and his arrest and conviction by the city court under the ordinance followed. He appealed to the Circuit Court, the latter dismissing the prosecution, and then the State appealed to the Supreme Court, wherein it is held that, "Although bees may become a nuisance in a city, an ordinance which makes the owning, keeping, or raising them within the city limits a nuisance, whether it is in fact so or not, is too broad, and is not valid."

While bees have been kept for centuries in towns and cities, it is a fact, so far as we have been able to discover by a careful search of the court records, that the city of Arkadelphia is the first on record to attempt to forbid them. It is conceded, however, that the keeping of bees in cities may be regulated as to quantity and the manner of keeping, or make the keeper responsible, as in cases of other animals with dangerous propensities. This, however, is quite a different proposition from that of an ordinance calculated to destroy a business or industry altogether. "All ordinances, arbitrary in their terms, and unreasonable, and unnecessarily abridging private rights, are void," says Dillon on Municipal Corporations. City ordinances can not be levied at a mere private nuisance to one or more persons. The nuisance must be public and general in its character, and must be an actual nuisance with sufficient evidence to sustain it. Courts have, therefore, taken knowledge of the habits of bees, and hold that it would be impossible, at the present state of the bee industry, for them to be more than a private nuisance, for which the person or persons injured or annoyed have their remedy as set forth in the *Olmsted v. Rich* case, *supra*.

The decision of the Arkansas court is a valuable and stimulating precedent, is good law, and a menace to those who attempt to interfere with a useful and growing industry, pursuit, or occupation.

Our next article will be devoted to the subject of damages by reason of the presence, keeping, and owning of bees.

NOTES OF TRAVEL.

Arizona Bee-keeping Concluded; the Temperature of Arizona; the two Associations; our Genial Friend "Mike."

BY E. R. ROOT.

I have before mentioned that there are two associations of bee-keepers in Arizona. One of them goes by the name of the Arizona Honey Exchange, of which J. Webster Johnson is secretary and manager. The other bears the title of the Bee-keepers' Association of Maricopa Co., of which J. P. Ivy is secretary. The first mentioned is a split-off from the other. Some members in the old society, it appears, were dissatisfied, and a new organization was formed across the river. But so far as I could see there was not, at the time of my visit, a spirit of ill will or rivalry between the two.

HON. J. P. IVY.

They are practically working together as one harmonious unit. Mr. Johnson finds a market for the members of his organization, and Mr. Ivy performs a similar service for those of his.

I have already introduced Mr. Johnson, and given a view of his apiary. I now take pleasure in presenting Hon. J. P. Ivy, the active man of the Maricopa Co. Association, who owns and operates some 700 colonies, and who is considered all through the Salt River Valley as one of the progressive and successful bee-keepers.

At the time I met him, there was a general gathering of farmers and bee-keepers at Phoenix, at a grange of some sort that was being held. Not only active in bee

matters, he is a leader in political matters also. Recently he had been honored by his party, having been elected as Representative on the Democratic ticket over a very popular candidate of the other party. I was invited by him to go out to his apiary, as he was expecting to do some honey-extracting the next day; but as I was then almost at the limit of my time I found it impossible to accept his invitation.

On this day of the grange meeting we met quite a number of bee-keepers. Besides other bee-keepers, whose names I do not recall, there were present Mr. Wm. Rohrig; W. L. Chambers; J. P. Ivy; and last, but not least, Mr. M. C. Wall, or "Mike," as he is familiarly called. Mr. Wall is another active man in the Maricopa Association, and owns and operates over 1000 colonies. His particular forte seems to be buying up apiaries that "do not pay." Often he will take those same bees, and sometimes in the same localities, and make them return the cash put up for them in one season. I had heard a great deal about Mike—of how he was a "hale fellow well met;" and when that person joined our group nearly every one began to smile, for Mike always brings a ripple of merriment wherever he goes.

I remember there was an argument between him and Mr. Rohrig as to how warm it was that day. I said it was about 120, or at least it *felt* that way to me. Mike made the statement that it was 110. Mr. Rohrig very promptly asserted that he was away "off." There was something said about soda water and ice cream. Mr. Rohrig very promptly accepted the challenge from his friend Mike; and thereupon some of the parties went to look at the thermometers at the nearest drugstore. Mike came back all wreathed in smiles.

"You will have to pay for the soda and ice cream," said he.

After we had refreshed ourselves at Mr. Rohrig's expense it developed that Mike had looked on the warm side of the building, where the mercury actually showed 110, yet the other thermometers showed only 105.

I mention this little incident to give an idea of the everyday weather in summer in Arizona; in fact, I was told that I would have to be prepared for a temperature of 120 in the shade. I did not find it as high as that; and Mr. Rohrig said, I think, that it never reached that, in his experience, in the Valley.

The question of temperature finally resolved itself into a little discussion as to the proper conditions favorable for a honey-flow. All practically agreed that a temperature of from 115 to 120 is decidedly unfavorable, especially if accompanied with a breeze. The air must be absolutely still, and the mercury in the shade should stand from 90 to 100. Then the honey will fairly rain down.

I had heard so much about Mike that I was anxious to visit his apiary. I "hinted

around" for an invitation, but he didn't invite. Finally I got Chambers to put the question to him straight.

"Oh, no!" said he: "I do not want any bee-man—much less the editor of a bee-paper, prowling around my place with a kodak. It looks too bad, and is not fixed up for company."

But Chambers winked at me and said, "We will go anyhow," and we did. I think it was the next day on our way back to Tempe when we stopped off at Mike's headquarters, for he was baching it. When he saw us coming he said something about a bad penny returning, and that he wasn't looking for us; but that made us all the more anxious to prowl around. Between two of his apiaries he had a great pile of

variety of odd sizes, for in Arizona there are several kinds of frames in use. The two most prominent are the Langstroth and the Nippert frame. The last named is a very small frame, 10×10. Besides these there are a few other odd sizes. Of course our friend had to take every thing just as it came. He is too progressive a bee-keeper to have three or four different sizes of frames among his bees; so what did he do but toss all the odd-sized combs, as fast as the brood hatched out, into that mammoth solar wax-extractor which you see just back of him in the picture? Then he would transfer the bees to a standard hive and combs. I think the pile on which he stands represents the year's business of buying up and transferring.

MIKE WALL'S PILE OF TRANSFERRED FRAMES: AN OBJECT-LESSON IN ODD-SIZED FRAMES AND HIVES.

brood-frames of various sizes, as well as parts of hives. He tried to steer us away from this object-lesson, but we did not "steer." I told Chambers that I wanted Mike right on top of that pile; "but," said he, with a wink, "it will take better men than you are to put me on it," and it would, no doubt. But by dint of coaxing I got Mike and Mr. Chambers on top, and took a snap shot or two. The result is before you. Mr. Wall said something to the effect that I must not use that for GLEANINGS, but I made no promise.

I have already explained that our friend was in the business of buying up apiaries, and then not only making them pay for themselves but pay for their keeping. But as a result of his buying, he got a great

As firewood is scarce in Arizona he finds that these old frames make splendid kindling-wood; and all he had to do was to go to the pile for fuel when he wanted to make a good hot fire to fry his beefsteak.

That our friend is an up-to-date bee-keeper will be further evident by a photo of him holding one of his combs with Doolittle queen-cells on it. He is a reader of GLEANINGS, and I found he was able to produce as fine a lot of cells as Doolittle or anybody else can turn out.

THE BOY BEE-KEEPER'S WONDERFUL RECORD.

It will be remembered that Mr. Chambers, of whom I have been speaking thus far in this article, is the boy bee-keeper

MIKE WALL AND SOME OF HIS DOOLITTLE
QUEEN-CELLS.

who, through his own independent exertions, *and without a dollar of help from any one*, is the owner of 500 colonies—colonies that he has *made* pay for themselves. Since I left Arizona I have learned that his crop for last season was 44,000 pounds from 400 colonies, spring count, or an average of 110 pounds per colony. If there is another young man in all the United States who has made that record *before he was of age*—yes, if there is another one in all the world—we have never heard of it. I am glad to introduce Mr. Chambers again to our readers.

Lest I might create a wild rush to go to Arizona and do likewise, I will state that all the irrigated parts of the State, so far as I know, are very much overstocked with bees and bee-keepers. The yellow butterflies, the tendency to cut alfalfa before it comes into bloom, the occasional failure of water, the hot climate, rattlesnakes, mosquitoes that are awful—all these and more, should be taken into consideration.

There are many other bee-keepers whom I should like to introduce to you; but as I have got something like 4000 miles ahead of me, and have not even yet got into California, I shall have to bring my Arizona series to a close.

But I will mention that there are Stahl and Hough, who own about 1200 colonies which they put out on shares. There is John Nippert, the owner and user of a shallow hive and frame. I secured what I supposed to be a good picture of him; but he

complained that it made him look so old that he wished me not to use it. But Mr. Nippert is a successful bee-keeper, and his little hive and frame have been pretty widely scattered throughout the Valley. He is a believer in the principle of handling hives instead of frames, and is very successful in carrying out his idea, for he runs between five and six hundred colonies on that plan.

YELLOW BUTTERFLIES AND ALFALFA.

During some seasons of the year these are quite a pest, both to the alfalfa-grower and to the bee-keeper. Mr. Chambers explained to me that they would sometimes be so thick on a field that it would be fairly yellow with them. They destroy the blossoms, with the result that no honey will be given off from that field or any field where they swarm, for they appear to go in swarms.

HONEY-PLANTS OF THE SALT RIVER VALLEY, ARIZONA.

The list of honey-plants that supply the brood-nest and bring the bees up into good shape for honey-plants are the following: First there is the wild currant in Decem-

W. L. CHAMBERS.

ber. Next comes the cottonwood about the 15th of January. These are the large shade-trees I have spoken about that grow so luxuriantly along the ditches. Following these about the first of February is the willow. This continues till March. Next there is the yellow sweet clover, or sour clover, as it is called in Arizona. This is followed by the first crop of alfalfa, coming on about the 10th of April. But from this first crop comparatively little honey is yielded.

The plants that begin to yield surplus now come on, among which is first the mesquite, something that grows in Texas, New Mexico, and Arizona—in fact, all through this portion of the United States on the semi-desert lands. Mesquite in Arizona blooms about the first of May, and lasts some twenty days. Next comes on catclaw, about the 15th of May, and continues till the last of June. This is followed by the second crop of alfalfa, and from this the greater part of the honey comes. Close on to this is the third crop of alfalfa, for there are three cuttings of this hay in Arizona. The alfalfa yield all together lasts till about the last of July, after which very little surplus is secured, although there are light flows following, keeping the bees in good condition, and rendering feeding unnecessary.

In our next issue I will take you to the hottest place in the United States, and the most deserted of all deserts, and then we will take a big long jump over into California.

BEE-STINGS NOT A CURE FOR RHEUMATISM.

Difference in Locality.

BY DELOS WOOD.

It is quite a common thing for the bee-journals to publish articles in favor of stings for the cure of rheumatism, and these articles are copied far and wide by the local press; but I have failed to see a single article refuting the statement. I contracted rheumatism in the army during the Civil War, and since that time I have worked every season in the apiary, having from 25 to 700 colonies under my care. Some of them would sting equal to Rambler's, and he intimated his would attack a hot stove-pipe. I have had hundreds of stings, day after day, for weeks at a time, but no relief from rheumatism at any time.

A friend of mine who was badly crippled with the disease told me he had tied strings around the bottom of his pants, and then put a cupful of bees from his crossnest colonies inside his pants, and worked in the apiary for hours with them stinging him, but got no relief from it.

GLEANINGS says that the poison from *Apis mellifica* is used largely in homeopathic practice. This case was the homeopathic remedy in allopathic doses.

Many things are laid to locality; but this can not be, for my friend and myself have kept bees in Indiana as well as California. Is it not owing to a difference in the disease itself? We are both afflicted with chronic muscular rheumatism. There is no swelling nor inflammation. Possibly these cases reported as cured by the stings may be the inflammatory form. Who can tell us?

Some things are largely due to locality; and in locating an apiary it is necessary not only to know that flowering plants abound but also that they produce honey in that locality.

Ventura Co., Cal., boasts of its lima-bean honey; but along the coast of Santa Barbara Co. a colony of bees would starve in the center of hundreds of acres of beans. There is not a drop of honey in them. In Colorado and in many places in California, alfalfa yields honey in abundance; but in this locality, I have never seen a bee on it.

Santa Barbara, Cal.

A PRETTY SUBURBAN APIARY.

Hives Made with the Barnes Saw.

BY W. F. TURNER.

Mr. Root:—The picture I send you is not just to my liking, but the best I had at hand. The artist was in somewhat of a hurry, and did not give me time to fix up or arrange things for the picture as I had wished, knowing that, if it got into GLEANINGS, it would be viewed by many a critical eye.

My success I owe largely to GLEANINGS and the A B C book, having received the first volumes of the former when issued as a quarterly.

Our home is at the extreme left. The home of our only son, Charles L., is at the extreme right. He and his family are in the automobile, coming down street from the west. His wife and oldest daughter, Carrie, are standing in front of our house. Fifty-five stands of bees are on this lot, but not all shown. Shop and honey-house is just outside of the picture, near the solar extractor.

By the side of your humble servant stands the Daisy wheelbarrow bought of A. I. Root years ago, and still doing good service. If you look closely you can see a bee-brush and smoker hanging on a comb-box. I use the wheelbarrow for carrying combs to and from the honey-house. I use the eight-frame L. hives, and have tried the various kinds of tops as made by the Root Co., and like the ventilated gable cover best of any.

I have made with the Barnes combined machine 80 hives and supers besides 50 winter cases; but unless one is far from the source of supply, or near cheap lumber, there is little or nothing saved if one's time is worth any thing.

A PRETTY AVENUE IN THE SUBURBS OF THE CITY OF PEORIA, ILLINOIS.

My output of honey for 1901 was 40 lbs. per colony, which found a ready sale here in Peoria at 15 cts. by the case for comb, and 10 cts. per lb. for extracted, put up in pint Mason jars. My pasture here is mainly sweet and white clover, basswood, and catnip. I don't take any stock in the red clover as a honey-plant except for bumble-bees, and this tongue reach I consider all nonsense. Why not turn our attention to the "business end," and grow shorter stings, as hornless cattle are grown?

GLEANINGS is always a welcome visitor at my home, and the Home papers are always eagerly scanned by myself and family, and just now we are enjoying a great treat in the Notes of Travel by the editor, as I have been six times through to California, and note the correctness of many of the pictures shown. I wish GLEANINGS would come four times instead of twice a month.

Peoria Heights, Ill., Feb. 5.

RECORD-KEEPING OF APIARIES.

A Modern and Convenient System.

BY ARTHUR C. MILLER.

I wish to call the attention of the readers of GLEANINGS to a very convenient system of keeping the records of their apiaries. It is not new in the literary or commercial world, having been long in use in libraries and business offices for all sorts of records and indexing. I refer to the card system. I have used it in business for fifteen years, but applied it to my apiarian records only about a year ago.

For the benefit of those who may not be familiar with this system I will give a brief description of it. It consists of a lot of cards of uniform size, perforated at the middle of the lower edge, all arranged in a drawer or tray, and held in place by a rod passing through the ends of the tray and

the holes in the cards. Assorted in among these cards are others having projections, or "tabs," which stand above the general level of the rest of the cards. These tabs serve as the guides or indexes to the cards back of them. On the tabs are written or printed letters of the alphabet, numbers, dates, subjects, or any manner of sign which will readily indicate to the user the matter to be found on the cards between that guide-

card and the next. The accompanying illustration will serve to make it more clear.

As may be readily appreciated, this system lends itself to an endless variety of classifications, and its usefulness is limited only by the skill of the compiler. When ordinarily referred to, the cards are tipped back or forward like the leaves of a book; and if the case is dropped, the rod holds all secure. When putting in new matter, or removing that which has become obsolete, the rod is taken out and all cards are free. It has this particular advantage over a book: All "dead" or useless matter is eliminated by simply removing the card it is on. Any number of cards may be used to refer to things about a colony or strain of bees, each of these cards being filed under a different classification, so that, no matter which of many titles is looked under, the details are readily found. Or one card may have records on one subject and refer to many colonies by number, letter, or otherwise. For memoranda in the hive, one of these cards is slipped under a bent pin or nail on the under side of the cover, or simply laid on the mat under the cover. Duplicates may be kept in the case in the house, or these cards may be left in the hive until filled up, when they are filed away and new ones put in their places.

If work is to be planned before going to an out-apiary, the cards referring to the colonies needing attention may be removed from the tray, classed according to the work to be done, put into an envelope, and slipped into the pocket ready for instant use when wanted. An outfit such as I have illustrated here, consisting of a case, guides, and 800 cards, cost me \$2.00, and was purchased of the Library Bureau, Boston, Mass.

I use cards ruled only across, as on letter paper. For all ordinary work they are as convenient as specially ruled or printed cards, and much cheaper.

Providence, R. I., Dec. 3.

[We use this same system all through our office; in fact, we have even gone so far as to discard the heavy and cumbrous ledgers in our book-keeping department, and have substituted in their stead drawers of cards like that shown in the illustration. The great advantage of this system over the book method for any kind of business or any kind of work is, as Mr. Miller points out, that one does not have to thumb over constantly records that have been completed, or which are of comparatively little use. The complete records are filed separately, while the new and unfinished ones, or those that are being filled out, are within finger reach.]

The time is coming when records of every nature will be on what is known as the "card-index" system; and Mr. Miller is correct in believing that such a system would be specially applicable to an apiary. This plan of record-keeping is respectfully referred to a certain doctor of the family of Miller.—Ed.]

QUESTION ON WINTERING.

1. Can I unite two weak colonies at this time of year? Is it too cold?

2. Do you make an air-spaced hive (no packing)? There are several bee-keepers here who use them, and prefer them to chaff. What do you think of them?

3. Is there a hive cover that will not leak? I bought several Danz. covers (made by you) last summer, and every one leaked so that I found a puddle of water on the canvas after every rain.

Shall I contract the entrance to your Dovetailed hive for outdoor wintering? I am a beginner.

F. P. BRIGGS.

Ayer, Mass., Feb. 1902.

[1. You can very easily unite colonies at this time of the year, in the cellar. All that is necessary is to put one hive on top of the other, and the bees will gradually work together.

2. All our double-walled hives can be made air-spaced, or packed with chaff, sawdust, planer shavings, or any kind of material. In a mild climate like yours, our double-walled hives would not require packing. Perhaps it would be better without; but in a colder climate the packing is certainly an advantage. We would refer you to "Chaff Hives," on page 11 of our catalog. In putting these hives together, leave out the packing and you will have the best double-walled or air-spaced hive there is made.

3. In our 1902 catalog we offer two covers which we guarantee will not leak. The new gable cover, or flat cover covered with Neponset paper, will be perfectly tight.

4. For outdoor wintering we recommend an entrance $\frac{3}{8} \times 8$ inches. For very cold weather an entrance $\frac{3}{8} \times 4$ inches would do very well; but in that case the apiarist himself should see that the entrances are clear, and not clogged by dead bees.

5. A compartment shut off from the furnace-room in your cellar would make an excellent place for wintering bees; but usually in such a room not more than 50 colonies can be accommodated to advantage. Too many bees in a room make the air too bad.—ED.]

HONEY FROM RED CLOVER; RED-CLOVER BEES.

I notice you advertise red-clover queens. So far as my experience goes, all Italian bees work more or less on red clover, especially the second crop; but I find quite a contrast in the quantity of surplus stored by different colonies. I have had a few colonies that gave me a fair surplus from that source, while others, apparently as strong, gave me nothing. This led me,

years ago, to believe it quite possible to produce a strain superior to any thing we already have in that regard, and reared the most of my queens from those best colonies. While my bees at present are more finely marked, I do not believe they are in any way superior, except the marking, to those I produced from 1868 to 1882. And this leads me to conclude that it is not as necessary to infuse fresh blood as some breeders claim. I purchased my first colony of Italians in April, 1868, and Italianized my apiary of about 25 colonies during that and the next season, and did not infuse any fresh blood until the summer of 1882. I am positive I secured as much surplus from red clover during the period named as I have since; and I am positive, also, that, during that period, there was no fresh blood infused, as I was the only person anywhere in this vicinity that bred the Italian bee, except a few of my neighbors whom I induced to try them. Since 1882 I have procured one or more queens annually, but can not see any improvement except in color. During the last two seasons I have reared queens from best colonies irrespective of color, being satisfied it is the correct course. I am pleased to see the change in breeding for color to that of honey-producing quality. I shall not feel surprised if the genuine red-clover queen were already here.

E. B. SLAUGHTER.

ANOTHER OFFER FOR BOGUS (?) COMB HONEY.

Mr. Root:—I notice on page 36 that you offer \$1000 for 1 lb. of manufactured comb honey, filled and capped without the bees. This is all right; but you said, "made at a factory," "*where such stuff is made.*" Now, we have lots of fools who profess they believe comb honey is made and filled by machinery. Among these are many ladies, one an "M. D." who ought to know better. One rich, highly educated lady told me intimate friends of hers had been in the factory, and seen tons of such manufactured comb honey. Now, I wish to say most emphatically there is not such a factory in the broad universe. I challenge, and will pay \$100 to any one who can name the State, county, city, street, or number, of any place where comb honey is or has been made; and I will give \$100 to any one that will give me one square inch of comb honey, made, filled, and capped in any way other than by bees in the past. I will give them ten years to do it in future. Any one, who knows enough about bees and honey to say white is white or black is black knows it is physically impossible to manufacture and cap comb honey.

F. DANZENBAKER.

Washington, D. C.

THE AMOUNT OF WAX IN OLD COMBS.

How much wax would the Root steam wax-press, described in GLEANINGS for August 1, take out of a full set of combs,

both brood and extracting, of an eight-frame hive? The combs in question would be very old, black, and poor, but not moth-eaten. In other words, how much available wax would a set of combs such as I described, contain? WM. BLOCH.

Dulzura, Cal., Jan. 24.

[This is a hard question to answer. A good deal depends on whether the combs were made originally from foundation; and, if so, was the foundation heavy, medium, or light brood? If no foundation was used at all, then the amount of wax that can be obtained will be smaller still. I should not expect, ordinarily, more than from half a pound to one pound of wax from such combs. With the best of apparatus, and combs that were built off from good heavy foundation, we might get two pounds; but under ordinary circumstances I should not be surprised if you did not get even half a pound.—ED.]

MOVING BEES ON A WAGON WITHOUT CLOSING THE ENTRANCE SUCCESSFULLY PRACTICED.

Last spring I moved about 60 colonies of bees a short distance, without closing the entrance. About dusk I went along and gave each hive a few puffs of smoke, then in a few minutes I went back to the first ones, puffed a little more smoke into five or six hives, then went to work loading until I had these five or six loaded, then smoked five or six more; commenced loading again, and so on until all were loaded. I started very carefully. If they were much disturbed I would stop for a minute or two, then start again. After going a little way I would not pay any more attention to them, but drive right along. R. C. CLARY.

Ft. Morgan, Colo.

A CARD FROM F. W. L. SLADEN.

Mr. Root:—Have you room in GLEANINGS for a few words of thanks from me to the American apiarists who entertained me so splendidly on my recent trip to the great country across the ocean? I was very sorry not to have been able to get over in time to attend the Bee-keepers' Convention at the Pan-American Exposition, but the disappointment was well compensated by the greater pleasure I had in becoming acquainted with some of the bee-keepers in their own homes. The "royal welcome" you bespoke for me in your issue of October 1 was indeed realized, and I had a downright good time with every bee-keeper I was able to visit. My chief regret is that I had only time to go and see so few.

It is difficult for me to sum up in a few words my many impressions of American bee-keeping from an English bee-keeper's point of view, so I will not attempt it here, but will just say that I made a special point of endeavoring to investigate the differences between the methods practiced in the two countries, and looking into the causes of these differences. I found this to

be a particularly interesting and profitable line of thought. On the whole I was surprised and delighted to see the remarkable progress that apiculture is making in America. Though I did not go far either west or south, I tried to realize the vastness of the country and the many varieties of the conditions for—and therefore methods in—bee-keeping that must exist. The industry is certainly in a very vigorous state. My best wishes for further progress during the year which will have begun before this reaches you, and also for a good crop to the bread-winners of the happy homes I have such pleasant recollections of having visited. F. W. L. SLADEN.

Ripple Court, near Dover, Eng., Dec. 26.

THE MARKED DIFFERENCE IN THE WORKING QUALITIES OF COLONIES.

I have many times watched the different colonies in my apiary when there was apparently very little honey-flow; and while some colonies were quite active, and actually bringing in honey, others would be almost entirely idle. I have observed it so closely and so many times, also noting the conditions of the active and inactive colonies, that I am satisfied in my own mind that there is quite a difference in the industrial qualities of individual colonies. And why should it not be so, the same as in the rest of animal life? Progression in bee culture is still ahead of us; and to obtain the best results means experimental study.

Your advice, Mr. Editor, in footnotes on page 975, I consider pure gold.

Brooklyn, Pa.

LUTHER S. ELY.

Please give me your opinion on wintering with super on, with no absorbents or any thing inside but cover sealed tight.

EARL N. EVERSON.

Brilliant, O., Nov. 17, 1901.

[Some very good results in wintering have been secured by leaving on the supers; but usually we would advise taking them off, putting on absorbents instead, or, perhaps, better still, a sealed cover.—ED.]

Will you please tell me how to feed refuse honey to bees at this time of year?

CLIFFORD RANNEY.

Hillsdale, Mich., Jan. 2.

[It is a bad time of year to feed refuse honey to bees, either in the cellar or outdoors. Better give cakes of hard rock candy, and keep your honey until next spring.—ED.]

LIARS—WHAT THE SUNDAY SCHOOL TIMES THINKS ABOUT THEM.

No liar can ever be great except as a liar. He does not stand on the eternal foundations of truth. All great tides of power in the universe sweep along the lines of truth. Whoever works against them goes down. Ananias died on creaky, all others, more or less so. The waters of this sin is death.

Happy is the man that findeth wisdom, and the man that getteth understanding.—Prov. 3:13.

It is now toward the latter part of February; and although I have not been away from home a single day during this past winter, and the weather has been cold and wintry (since the first of January, any way), I have been having an exceedingly happy time. In fact, I do not know that I ever enjoyed life more than I have during this past winter. I am happy when I get up in the morning, because it gives me a chance to get at the work I love. To tell the truth, it hardly is *work*, for to me it is more like play. When it comes dinner time I am happy again, because, although I had almost forgotten it, I was so much taken up with my work (or play) that I had actually forgotten I was hungry. I can thank God for my dinner, with honest sincerity, because I have an excellent appetite; and it is the same way in the afternoon and the same way at supper time. Of course, I have my afternoon and forenoon naps when I am tired; but so much interested have I been in this winter occupation that of late I have been sleeping only fifteen or twenty minutes. I am happy again during the evening because I have the latest books and papers devoted to my favorite pursuit; and I am happy again at bedtime because I go to sleep instantly, and sleep soundly until the electric lights flash upon us at a quarter after five, admonishing us that it is time to begin the day. Before breakfast I enjoy my work again.

Now, this work I am going to tell you about is not any thing particularly expensive—that is, it need not be; and any of you or every one of you can commence it (on a small scale) right in your own homes. Of course, you may have some difficulties to surmount; but where there is a will there is a way.

Now, friends, if you did not know me you would begin to be suspicious that I had something to sell; but the thought of it makes me feel happy again, for I can say, "Thank God I have nothing to sell, and no monopoly of the business." I have been happy because I have been getting wisdom and understanding; and, above all, because I have been daily and hourly—yes, and almost every minute—in touch with the handiwork of the great Father above. I have felt his presence as I studied his works. All my life I have enjoyed, as you may know, learning the whys and wherefores that I may control Dame Nature, and make her do my bidding.

Let me say briefly that this work I am talking about is growing plants over in that little greenhouse. You may say you have not all got a greenhouse. My dear brother

or sister, with God's help you can get one if you want it *bad enough*, if you are willing to pay the price. You can commence with just a window of your sitting-room or kitchen; but before I tell you about it I wish to diverge a little in order to get the point clearly before you.

Most of you have been studying the new catalogs of seeds and plants; but I hardly believe any one of you fully realizes the amount of work that has been done to *get* these new things that are delighting the world. I regret that it is not all honest work—that is, some of the pictures paraded are to some extent not really new, but most of them are. Now, read carefully the following, which I take from the last *Rural New-Yorker*:

AN ELUSIVE RADISH.

Being impressed with the scarcity of desirable summer radishes, the writer began, about ten years ago, breeding experiments looking toward the development of a type which would grow well during the summer heat, remain in good eating condition a reasonable time, and be of sightly appearance and mild flavor. Beckett's Chartier came nearest the ideal in mind at the time, but it requires about eight weeks to develop; and though mild, crisp, and tender when at its best, it soon grows coarse and pithy. To impart greater durability of texture, and restrain the tendency rapidly to run to seed, the Chartier was pollenized with a hard white summer radish of local origin, and the best of the resulting crosses, which were rather too pungent in flavor, with an unintroductory white Chinese radish the succeeding year. This induced the hybrids to "break" wildly, but a few roots retained the form and some of the crimson coloring of Chartier, though with hard texture and slow maturity. The long early scarlet and a forcing round scarlet variety were next successively introduced in the strain, and rigid selection began, after growing seedlings from the last cross. There was not as much variation among these later generations as might have been expected, but the looked-for type was very slow in developing until the eighth year, when it appeared at a bound, all the seedlings being much alike, varying only in proportionate length. The newcomer was of the Chartier type, pale rose shading to white in color, tender, succulent, and well flavored. It developed rapidly, but retained a small top, and was very slow in running to seed, standing in good condition several weeks in the hottest weather. Here, apparently, was a good thing, planned and worked for, but secured at last. The next year as grown from seeds saved from the most perfect specimens, they came so uniform that the only remaining defect appeared to be the shy seeding of the selected roots. The next year the new radish was planted with high hopes, but a great proportion failed to "bottom-out," running at once to seed like charlock or wild mustard. So complete was the reversion that except for the white flowers the degenerate plants could scarcely be distinguished from charlock. This was disappointing, but the best specimens of those showing no deterioration were isolated by the removal of all others, and seeds again carefully saved. The result of this last sowing revealed a general stamped toward the primitive wild radish—scarcely two per cent keeping to the improved type, which had seemed at one time in a fair way to become fixed—and in this abrupt manner our ideal summer radish slipped out of existence.

The uncertainties of breeding by hybridization special types of such economic and ornamental plants as must commonly be propagated from seeds, is thus detailed at some length as explanatory of the tendency of many high-bred strains, originally produced by cross-breeding, to fall away from the advertised standard. Mendel's law of hybridization, based on long and carefully conducted experiments, seems to show that the pollen and seed embryo cell of diverse plants of the same species or genus invariably unite in a definite manner, and that, however various the association of the characteristics of the parents may be in the progeny, the separate individualities are preserved, though often dormant, for many generations, and may at any time reappear with startling suddenness in individual plants. There will ever be much difficulty in fixing and retaining types produced by cross-

ing, where seed propagation is necessary, though occasionally a hybrid is so happily balanced that it seems to become a new species, and may be grown on indefinitely with reasonable care in selection.

W. V. F.

Friend W. V. F. has been at work for ten years to produce an ideal radish; but after he got it, like a wild colt out on the plains it got away from him, and there is very little hope that that *same* "colt" will ever be caught. Somebody else, by working ten years more or less, may get something near to his ideal. It is just like the strawberries. A strawberry having all the good qualities that a dozen others have, is not yet known. When we get it (if we ever do) a single plant will be cheap at a thousand dollars. Do you know why he could not hold his radish? The reason is this: Radishes must always be grown from the seed. You can not take slips as you do from a geranium, nor runners as you do from a strawberry; nor can you graft radishes as you would graft apple-trees, and bud peach-trees. It was because of this that our friend could not hold his beloved "wild colt."

Now, this work that has made me so happy has been studying the "cutting" business. That china dish of white sand has been my favorite tool, only I have a lot of dishes so I can start cuttings more or less every day; and then every morning and sometimes every afternoon I am delighted to find certain plants that had been behaving contrary have got into line, and are doing exactly what I wanted them to do. When we get at the *conditions*, the thing is easy. Oh how many times I have found this to be true during my busy happy life! I worked day and night trying to make comb foundation—burned my fingers, spattered my clothes, littered up the house, and it seemed only continual defeat. But little by little I began to "catch on," first to one important condition and then another; and now our young people down in our new wax-room would look up in surprise to hear there was ever trouble about it, the thing seems so easy and so natural.

Well, I could not make coleus-plants grow to suit me. Oh! I forgot to tell you I have been studying the catalogs and sending a few cents here, there, and yonder, for some new plants. Then before I could make cuttings I had to study this new plant, get acquainted with it, and find out how to make it grow strong and vigorous. Well, I have never succeeded with the coleus till this winter; and now I find it is one of the prettiest plants to make grow we have in the greenhouse. The reason I did not succeed was because I did not keep my forcing-bed *warm* enough. I supposed 80 degrees would kill every thing; but I was so stupid I did not consider that we sometimes have 80 and 90 in the summer, and it does not kill things either. With a bottom heat of 80 degrees, and the heat above as much as 70 or 75, with a confined moist air, the coleus grows like a weed, and shows the most brilliant colors I ever saw.

Well, most of these new plants are expensive. I paid 35 cents for a single geranium by mail. I had it in bloom in about two days, and in two days more I had some cuttings, so my plants will not cost me very much after all. From six golden-leaved salvias I have now 30 beautiful plants. That is about as many as I have room for.

During former winters I have been much troubled by the green fly, red spider, and mealy bug in my greenhouse. This winter I have had hardly a glimpse of insect foes. I banished them with what is called "nicotine punk," which I bought of the Skabura Dip Co., Chicago, at 60 c. a dozen rolls. Four or five rolls have kept my greenhouse absolutely free from insects all winter. This one thing makes a vast difference with a florist. Sometimes the stuff I order from away off is infested with mealy bug; but it is easily fixed by fumigation as above.

Well, this winter for the first time I have really got in touch with making plants grow by starting them in the smallest size of pot and giving them a larger one just as fast as they needed it, and no faster. When you learn the trade, and really get in touch with the plants, it is just wonderful how you can make things grow. A friend gave me a slip of *Impatiens Sultani*. I put it in the white sand, and a few days afterward something on the plant looked like a drop of blood, only it was more brilliant. I put on my "specs," carried it to the light, and found it was a little bud unfolding. The slip put out a beautiful blossom in that wet sand before it had even a speck of root of any sort. Surgeons are hard at work on the problem, and have at least partly succeeded, in having a human being live with his stomach entirely removed. In the same way we make a plant grow with vigor when its roots are *all cut off*—in fact, when it has not any sign of a root of any kind. Just get the temperature, moisture, and other things all right.

Well, about the time the blossom dropped I discovered little roots on the slip. I put it in the smallest-sized pot and put it back in my cutting-bed. In ten days the pot was full of roots, and it wanted more room. I gave it one just a little larger. In three or four days it wanted more room still. I bought some cinerarias. For two weeks they did not grow, and I thought they were going to die. I did not keep them warm enough. I gave them a bed where the temperature was from 60 to 70, bottom heat, day and night. Then they commenced to boom. I gave them larger pots, and larger still. I got them on the run, as it were, and it seemed to me they were really on the "double quick." Some of the strongest are now in eight-inch pots. The foliage is just wonderful (almost as "big as a cabbage"), and they are opening their brilliant glittering flowers while I write. I dropped the hose on one of them, and snapped off the center of the plant, buds, and two or three leaves. I felt as bad over it, almost, as if I had hurt a living being. In a min-

ute my spirits began to recover, for I thought of my spare saucers of white sand. I put it clear down so just the leaves and the buds were out of the sand; kept it wet and warm, and—would you believe it?—that bud without roots opened up before those on the growing plants. It was not sickly nor stunted. It seemed to say, "Oh! you need not feel particularly bad about the accident. I do not really need roots if you give me every thing else I want."

Well, the old plant has put out two or three branches of buds in place of the one I took off, and the new one is putting out roots, so I am going to have an *extra* plant, and possibly the old one will give an extra amount of bloom just a little later than the rest.

Now, what makes me happy is that I am making discoveries every day. They may not be new to florists, nor to somebody else in this big wide world, but they are new to *me*; and I am getting in touch with these new and strange forms of vegetation so I can hold on to them—not as our brother did with the radish that "eluded" his grasp just when he thought he had it for sure. And talking about radishes reminds me that, years ago, I worked several seasons for a white lettuce like the white-plume celery. I got so far as to put lettuce on the market that was part white and part green; but my patrons got a notion that the white spots were the result of putting some kind of poison on the leaves to keep off insects. Well, I finally got a few stalks that were all white, but they lacked vigor, just as the Madame Saleroi geranium, the one bordered with white, lacks vigor compared with the green-leaved geraniums. Now, very likely my feeble white lettuce might have been crossed so as to give it vigor, but I became discouraged and let it drop. Vaughan, of Chicago, advertises in his catalog a new variety of *Impatiens* (*I. Platypetala*). I have just to-day received three of the plants. The flower is larger than the old *Sultani*, and the foliage is quite different, although it resembles our old friend. I should judge it is a ranker and more luxuriant plant, because they stood right up strong in the full noonday sun. Of course, the new plants cost quite a little; but when you consider that one who knows how can multiply the plants with great rapidity, you will not mind paying 30 or 40 cents for one to start with. By the way, this *Impatiens Sultani* is perhaps more commonly grown as a house-plant than any thing else unless it is the geranium. A lady friend of ours had a beautiful plant two or three feet high, just covered with bloom. I asked her the name of it. She said she had never heard any name given, but she called the plant worth a great deal of money. When I came to examine it closely I saw it was just a beautiful specimen of my old friend.

I have seen some very fine ones in some very humble homes. Some people call them "balsams." The only trouble is they will not bear any thing like a freezing tempera-

ture, and are not nearly as hardy as the geranium, and they do not usually grow very much unless they have a pretty warm place near the stove. If it is not very light it does not seem to matter very much.

Now, we need not be discouraged by thinking it is only the florist who can have these beautiful plants. One day I made a wheelride of several miles to see a pelargonium (Lady Washington geranium). It was, perhaps, three feet high, and may be two broad. It filled the entire window fronting the street. The woman was not a florist, and did not know much about plants; but she had learned how to give this plant just what it wanted. When I asked if it was for sale she said she had refused five dollars for it several times; and she kept it season after season the greater part of the year covered with bloom. I never saw any thing to compare with it in any floral establishment. Cases of this kind come up frequently. Some of the finest house-plants the world has produced are in the possession of very humble people in very humble homes. Any ordinary home can be managed to furnish the conditions necessary to grow beautiful plants. You can commence this work any time anywhere, and almost without capital. If you succeed, by the aid of a sash or two, you can enlarge your window to a hot-bed, and, later in the season, to a cold-frame. When you get half a dozen sashes, with little expense you can have a little greenhouse where you can get inside to work and raise stuff to sell. Many large floral establishments have been started in this manner, on a very small scale. I bought my first azalia in Utica, N. Y. I visited several greenhouses, and finally found a place where the plants were not only greatly superior but very much cheaper. I asked the proprietor how it happened. He said something like this:

"Why, I am not really a florist. I commenced growing flowers for the fun of it, without any instructions whatever except what I got from books and periodicals. The other florists are all down on me because I do not keep up to their prices; but I should like nothing better than having a market for all I can produce, at the prices I am getting."

He was in love with his work, just as I am in love with mine this winter. By the way, when you are learning how, the very easiest plant to work with that I know of is the nasturtium. All you need is some nice seeds to start with. Better have one of the dwarf Tom Thumb varieties; and I would suggest Empress of India. Mine came from Burpee. You will not need very rich soil for nasturtiums (or "stertians"), especially for indoors and greenhouse. They will grow too rank. Mine began to grow too tall, so I cut off the tops of the whole of them. It seemed too bad to throw the tops away, and so I stuck them in a saucer of sand. In three or four days they were standing up so brisk and thrifty-looking that I pulled one out, and each cutting had

a mass of beautiful white roots; in fact, the roots were too long before I knew it. Better not let them stay in the sand until the root is over $\frac{1}{2}$ -in. in length. Some florists say, do not let them get to be over $\frac{1}{4}$ -inch.

After you learn how to make nasturtiums grow you can take other plants that are more difficult. We have succeeded in making some beautiful plants of cuttings of "Crimson Rambler" roses, but it takes two or three weeks to get them rooted. Almost any plant that grows can be made to take root when you get at the conditions and understand them. Even hard-wood trees can be propagated in the same way.

Now, the great point in this cutting business is that, by means of the process, we are enabled to hold fast to that "wild colt" that our friend got hold of when he was getting out the new radish. Luther Burbank, of California, has taught the world that we can have almost any thing we want (in the way of fruit) if we are willing to work for it a sufficient number of weeks, months, or years, as the case may be. I know I have written considerable on this same subject before but I firmly believe that one of the remedies, not only for our physical ills, but for the era of crime that is now casting a dark shadow over our nation—one of the great remedies for both sickness and crime, so it seems to me—is getting people busily employed in studying God's works. I have found health, even during this severe winter time, because I have been so busy and so happy. There is an unceasing demand for men (and women too) who are experts along the lines I have been treating. This work enables us to keep in constant touch with, and keep plainly in sight, not only the leaves and flowers of the plant, but the root-growth. I never enjoyed watching root-growth before as I have this winter; and when every thing is just right the microscopic roots push out and grow with wonderful rapidity. Again and again as I knocked the black balls of earth out of my little pots (or a big one, as the case may be), I uttered exclamations of surprise and delight to see a beautiful plant had done wonders in the way of root-growth when I least expected it. Be patient; work carefully; watch and inquire; get every thing just right, and your reward will come. And again and again it comes home to me that our children—yes, the babies as well as the boys and girls—are not unlike the plants. Parents seldom realize the possibilities that lie before their children. Many a mother has watched and waited and prayed as her gentle and loving hand guided the little mind that was intrusted to her care. Many times, perhaps, it has seemed as if the young mind was attracted only by evil; but finally she succeeds in sowing the good seed and *starting* right impulses in the little mind. It grows and develops day by day, and finally, before she suspects it—yes, before *anybody* thought of it—this boy or girl has budded and blossomed into a glorious Christian character. His work

will not only stand through all time but through eternity.

MECHANICAL AIDS IN OUR HOMES; HEATING AND LIGHTING BY ELECTRICITY WITH WINDMILL POWER.

Mr. Root:—Work out a plan to heat and light our homes by electricity by means of windmill power, and tell us all about it in your journal.

Waverly, Neb., Feb. 14.

G. R. NOREN.

Friend N., the thing you mention is already being done, but the apparatus is quite expensive. The Aermotor Co., of Chicago, will send you circulars telling you more about it than I can here. The principal difficulty is storing power sufficient to do the work when the wind does not blow. One way is to have an elevated reservoir in which to pump the water. Let this water run a water-motor, and you have it. Another way is to use a storage battery to store up the electricity until needed. My impression is the reservoir for water is cheaper and less complicated; and there is this in its favor—you can have the water for any other purpose you wish. The trouble with wind for all such uses is that there are times, perhaps intervals of several weeks or months, when you will have an enormous amount of power—enough to last through long periods; and then, again, there are considerable periods when there will be little or no wind. This necessitates a great amount of water—that is, if you are going to use electricity for heating as well as lighting. If you want to run only a few lamps, the matter is comparatively easy. Another thing, there is quite a loss of power by using it first to pump up water, and then convert the falling water into power again, and have this power run the motor. The world is now waiting for some cheaper storage battery, or for some short cut to apply the power of coal, or wind either, so it can be applied directly to the motor. The power from the windmill direct, as you know, is very uneven, even with our best-regulated mills. Unless you have a storage arrangement, either a reservoir of water or electricity, your lights would be first away down until you could not see, and then they would flare away up in a perfect blaze, burning out your fuses, and possibly melting your wires. The wind is all right for plenty of power; but it is, as yet, much like an unbroken colt. It needs taming. If any of our readers are using electric lights furnished by windmill power we should be glad to hear from them. An unfailing spring of water solves the problem easily. Even a very small stream, where you have a sufficient fall, will light your home beautifully; and if the volume is large enough it will also warm your rooms and do the cooking. I expect, this coming summer, to harness up a spring to light up our cabin in the woods. Perhaps I should say, rather, I am going to make some experiments in that direction.

Potatoes for Sale.

Sir Walter Raleigh seed potatoes. Choice and true to name. \$1.00 per bushel, F. O. B. **New York Peerless Farm, Lyons, N. Y.**

"The A B C scholar that grew so fast," was the way that A. I. Root used to refer, years ago, to Mr. E. A. Morgan, of Chippewa Falls, Wis. The reason that he used this expression was because Mr. Morgan took such wonderful strides and made such a success of bee-keeping. By the way, he has kept right on doing the same all of these years, but has not said very much about it of late. Knowing all this, you can imagine the pleasure with which I read the following letter:

CHIPPEWA FALLS, WIS., Feb. 8, 1902.

Friend Hutchinson:—I have 160 colonies of bees, and am breeding some choice queens for my own use. Last season I got hold of an extraordinary queen, and bred some queens from her. The bees from her daughters made nearly double the amount of honey stored by other stocks of the same strength. I traced her to Aug. Bartz, formerly of this place, and find that her mother came from you. I write to ask if you have any record of the queen sent to Mr. Bartz; and, if so, will you tell me where she was procured? I would also ask if you have any such queens for sale now? I shall want two or three in the spring, as I consider that queen that you sold Mr. Bartz as being of the best strain I ever knew, and I have been an extensive breeder since 1879. Write me.

Respectfully yours, E. A. MORGAN.

That queen was of the Superior Stock that I am advertising, and it was the receipt of just such letters as that, coupled with my own experience, that first attracted my attention to this stock. The man who buys this stock makes no mistake. By the way, if you wish to try a queen in the spring, don't wait until then before sending in your order. If you do, there may be so many orders ahead that you will have to wait until late in the summer before the order can be filled. Order now before the rush comes on. The price of a queen is \$1.50, but I guarantee safe arrival, safe introduction, purity of mating, and satisfaction to the extent that you may return the queen any time within two years and the money will be refunded, and 50 cts. extra sent to pay for your trouble. One queen, and the Review one year, for only \$2.00.

W. Z. Hutchinson, Flint, Michigan.

1902 ITALIAN QUEENS.

From imported and home-bred mothers, by up-to-date methods. Tested, \$2.00. Untested, \$1.00; six, \$5.00; twelve, \$9.00. Full colony, \$6.00; three-frame, \$2.00; two-frame, \$1.50; add the price of queen. Discount on large orders. Write for circular.

Our Buckeye Strain Italian Queens are unsurpassed. Untested, 75c each; 6, \$4; select tested, \$1.50. Order now.

The Fred W. Muth Co., Front & Walnut Sts., Cincinnati, O.

Queens You Should Have

Does blood tell in other stock? Give your bees a chance. Stock used for breeding the queens offered—not from a sport, but my pick out of an apiary giving last season an average yield as follows:

Honey Gathered.

102 lbs. extracted and 68 lbs. comb honey per colony besides increase and stores for winter.

Quality of Comb Honey Produced.

"Man! It would dazzle you."—Wm. McEvoy, Ontario Government Inspector of Apiaries.

Wintering Qualities.

Up to the present, January 30, I never found these bees to show the least indication of unrest—always perfectly quiet. They are wintering perfectly.—Frank T. Adams, Brantford, Canada.

General Commendation.

Out of those queens you sent me I have produced the best race or strain of bees I ever owned. Remember that is saying a lot, as I have tried every breed imported to this country. The bees winter better, build up, and stand cold chilly winds in spring better, and are more suitable than any bees I ever owned. For the season they gave me about double the honey the pure Italians did, and more increase. Glad you are going into the queen business, and are going to join our ranks again. We are much in want of a few men like you. C. W. Post, Ex president Ontario Beekeepers' Association (owns 365 colonies).

S. T. Pettit, Canada's most successful comb-honey producer and bee-keeper, says: "The blood in my apiary is largely the progeny of queens sent by you, and they are grand bees."

Prices of Queens.

They are duty free to the United States. Tested, \$2.00 each; \$10.00 for 6; \$18.00 per dozen. Untested until July 1st, \$1.25 each; \$7.00 for 6; or \$12.00 per dozen. Same after July 1st, \$1.00 each; \$5.50 for 6; or \$10.00 per dozen. Larger quantities, prices on application. Postage stamps taken for fractions of a dollar. To be fair to every one, no selected tested queens are offered. Every one has the same chance. The above queens are bred from a careful selection of Italians and Carniolans. Pure Italian and Carniolan queens same price. Price of full colonies on application. Orders booked as received, and filled as quickly as possible. Order early. Address

R. F. Holtermann,

Bow Park Co., Limited, Brantford, Ontario, Canada.

A QUEEN FREE.

Our stock is the very best that money and experience can procure. Just give our stock a trial and be convinced. We will give one warranted queen free in July for every order for one dozen queens before May 1, in order to have you try our stock. Prices: Untested, each, \$1.00; 6 for \$5.00; 12 for \$9.00. Select tested, \$2.50. Tested, \$1.25. Two-frame nucleus and warranted queen, \$3.00; three-frame nucleus and queen, \$3.50. Send for our catalog of bee-keepers' supplies and our price list of Italian queens and nucleus colonies, with description of our strain of bees.

Six Governments

in America and Europe have adopted and use exclusively

THE SPRAMOTOR

Eighty-two outfits are in use by Ontario and Dominion Governments alone. The Spramotor has won over one hundred Gold Medals and First Awards in the past three years.

Wins a Government Spray Pump Contest.

This is to Certify, that at the Contest of Spraying apparatus, held at Grimsby, under the auspices of the Board of Control of the Fruit Experimental Station of Ontario, in which there were eleven contestants, the Spramotor, made by the Spramotor Company, was awarded first place.

It is further endorsement needed it will be found in the superiority of the Spramotor itself. It is an easy, quick and thorough eradicator of fruit and vine diseases and insect pests. Unequaled in white-washing and painting buildings inside and outside, oil or water paints. We publish an 80 page book, "A Gold Mine on Your Farm," which in addition to formulas, tables, best methods, etc., in spraying, tells about the Spramotor. We mail it free. Ask for a copy.

You

Might Just As Well Grow Good Fruit

if you are going to grow fruit at all. There will be no trouble about it if you spray your trees, etc., with the

HARDIE SPRAY PUMPS

They will reach the highest tree and the lowest vine and cover everything with a spray as fine as fog. We make them mounted and unmounted Barrel, Knapsack and Bucket Sprayers. Each is the best of its kind in every respect. Each pump is of sufficient strength, size and capacity to supply several nozzles or clusters of nozzles. That means fast work. Our illustrated catalogue tells the whole story of when, where and how to spray. Gives best formulas for mixing spraying material for each disease and fruit. We mail it free. Ask for a copy.

The Hardie Spray Pump Mfg. Co., 63 Larned St., Detroit, Mich.

Driving a Bargain at Long Range.

You do exactly this when you send your money away for a buggy or carriage you've never seen. Whether you get a bargain or not depends not on your good judgment or shrewdness, but entirely upon the honesty of the man who sells you the buggy. Your money is in his hands and you are at his mercy. We do not believe in that method. It is too one-sided.

What is our plan? Well, we have such confidence both in you and in our **Split Hickory Vehicles**, to please you that we ship anywhere on it. Compare it with the buggies you have paid considerably more for, and if not satisfied your life at the end of 30 days you can send it back to us without paying one cent. We manufacture our own goods. We know how and of what material they are made, and we know they will stand the test. Our large new catalog describes and gives prices of our mammoth line of buggies, surreys, carriages, and harness. It is free. Send for it at once.

BETTER THAN SPRAYING.

Don't lug barrels of water around when spraying. Use the poison direct. Our

Common Sense Dust Sprayer

and Insect Exterminator is a most ingenious device that is rapidly supplanting the old methods. It blows the finely powdered dust into every nook and crevice. Reaches the bottom as well as the top of leaves. Destroys insect life on plants, vines, shrubs and trees. Just as effective for vermin on poultry and pigs. More rapid than spraying. Descriptive circulars and testimonials free.

HILLIS DUST SPRAYER CO., Box 17, ST. JOSEPH, MO.

Wagon World Awheel.

Half a million of these steel wheels have been sent out on our own wagons and to fit other wagons. It is the wheel that determines the life of any wagon, and this is the longest lived wheel made. Do you want a low down **Handy Wagon** to use about the place? We will fit out your old wagon with **Electric Wheels** of any size and any shape tire, straight or staggered spokes. No cracked hubs, no loose spokes, no rotten felloes, no resetting. Write for the big new catalogue. It is free.

Ames Plow Co., 88 Market St., Boston.

A NEW HEALTH FOOD FOR POULTRY AND PEOPLE.

Our poultry-house, as I have already told you, is built over a strip of ground where exhaust steam runs through tiles under it from the factory to our home. This exhaust steam not only keeps the ground floor of the poultry-house warm, but it is as dry as the dust in the road on a summer's day, all winter long. Chickens scratch and wallow even when it is wintry outside and storming. Six feet above this warm ground, where their roost is, the temperature is seldom much below freezing, even though there are various cracks, left purposely for ventilation. I do not believe poultrymen have given sufficient attention to this matter of warming the ground *under* their poultry, by exhaust steam or otherwise. If dryness is desirable for fowls, we have it to a dot. Wherever exhaust steam is escaping into the open air unused, such poultry-houses may be had without any expense, except the first cost of construction. Why, we had two chickens hatched by a hen that stole her nest, the day before Christmas. One is now nicely feathered out, and the other would be if it were not for the dogs I am going to tell you about. To be up with the times, and get winter eggs, I bought a bone-mill. The people at our meat-market let me have a heaping half-bushel basketful of bones, containing quite a little meat, for only ten cents. We got along finely until the cats and dogs in the neighborhood acquired an appetite for ground bones as well as the poultry. One of our neighbors across the way has three dogs, and two neighbors next him have a dog apiece. I very soon discovered that, if I did not stay with the chickens until they had eaten up the bones I had ground, the cats and dogs would drive them away as soon as I was out of sight. After dinner I carry over the refuse from the dining-table in the factory. But one day I found *five dogs and five cats* waiting for the "cold victuals." Why don't I shut the chickens in, and so keep the dogs and cats out? Well, there is a strip of green grass right over where this tile carries the steam, where the chickens get out to get fresh air and pick grass during favorable days all winter. Another thing, our poultry-house is mostly made of hot-bed sashes. Broken panes of glass usually do no harm, for a great deal of the time the poultry-house would be too warm were it not for this abundant ventilation. In fact, it is so warm inside I usually hang my basket of bones on a limb of the evergreen trees outside. Well, when I got tired of wasting my strength in grinding bones for five cats and five dogs, they began to appropriate

my basket of bones *without* being ground. I commenced (thoughtlessly) hanging the basket down low; but as I gradually put it higher, the dogs learned to jump higher. Finally I told Mrs. Root that those dogs had really learned the trick of climbing trees. By the way, did you ever hear of the boy whose father overheard him telling a story about how their dog climbed a tree? The father interfered at this stage of the narrative.

"No, no, Johnny. Dogs do not climb trees. What are you thinking about?"

"But, father, the dog did climb a tree this time. You see he *had* to do it. There was *no other way*."

Now, my five dogs were a good deal like Johnny's dogs. There was "no other way" to get my basket of bones than to climb the evergreen-tree. Of course, I did not see them do it, for it was after dark; but the bones were tumbled about on the ground, and carried off. Mrs. Root suggested that the five cats climbed the tree, and, after they had gnawed off what meat they wanted, they tumbled the bones down to the dogs. Now, here is a point which Mrs. Root and I have not yet settled. But I leave it to you if her story is not as improbable as the other. Just imagine the cats sitting up in the tree and tumbling the bones down to a lot of ill-favored hungry dogs! Never mind. Just at this stage a lady over in Akron—a friend of our eldest daughter, Mrs. Calvert—told Maude to tell her father *she* could help him out of his trouble. Instead of using bones she said I should get some field corn and roast it in the oven, ear and all, and give it to the hens to shell off. She said that would make them lay as well as bones, or better, and the dogs and cats would not eat it. Well, Mrs. Root roasted the corn, but some of it was almost charcoal (by mistake) rather than parched corn; but I gave it to the "biddies" all the same, and the number of eggs increased at once. Now, I do not mean to say here that parched corn will take the place of bones. It started the hens to laying because it was a change of diet; and any change of diet, almost, will increase the number of eggs—a head of cabbage, for instance, nailed to a post so it will be just a little above their heads; or, still better, some Grand Rapids lettuce-trimmings. I rather think, too, that the *charred* corn is better than parched corn, at least for a change. You know charcoal is relished by most domestic animals, and it assists digestion; and there is not any better form of charcoal to be had than charred corn or other grains. When I was watching the poultry snap up the hot corn I tried some myself, and here is the great point of my story. I told Mrs. Root there was not another cereal in the market, to my mind, as delicious and appetizing as this parched corn. Another thing, I found it excellent medicine. I have been for some years more or less troubled with constipation. This parched corn is Nature's reme-

dy. A friend of mine has a sort of axiom that the best "medicine" for a sick *horse* is *grass*. In the same way I begin to think the best medicine for bad digestion is *corn*. Chickens can eat corn raw, but human beings want it cooked; and the most obvious and natural way to cook the corn is to roast it just enough so you can chew it easily, then eat it slowly, giving the action of the jaws time to bring up the digestive juices provided by nature. Take plenty of time to chew the corn very fine, and see if you do not decide it is not only the most delicious food, but that it is the best medicine for bad digestion.

In answer to my prayers for wisdom and understanding in regard to this matter of health, God directed me (at least so I understood it) to go up into the woods and live as I have told you. Now, I have been praying for years to have it made plain to me whether God wishes his children to take *drugs* when they are out of health, and I feel now that the answer is coming. Instead of drugs, use corn and other grains. To make them digestible, cook them by roasting, just as the Indians used to do. Try it, and see if you do not agree with me that it is a most delicious food as well as a grand substitute for any kind of medicine.

Special Notices by A. I. Root.

Wanted, sweet-clover seed, hulled or unhulled.

BASSWOOD (OR LINDEN) TREES.

Now is the time to take them up. We have a splendid lot of one foot and under, grown in our nurseries. Prices as follows: One foot and under, each 5 cts.; 10, 30 cts.; 100, \$2.00. By mail, each, 8 cts.; 10, 35 cts.; 100, \$2.25.

SIR WALTER RALEIGH POTATOES, SECOND SIZE.

Our second size are all sold out, but we have plenty of firsts. Charles Vanderbilt, of Lyons, N. Y. can fill orders for seconds at our prices—\$2.00 per barrel of 11 pecks, so long as his stock of 200 bushels lasts. Guaranteed true to name, and nice seconds.

COW PEAS, WHIPPOORWILL.

In addition to the cow peas mentioned in our last issue, we have made arrangements to furnish Whip-poorwill at the same price as the Wonderful; namely: Quart, 12 cts.; quart by mail, 15 cts. more; peck, 75 cts.; $\frac{1}{2}$ bushel, \$1.35; bushel, \$2.50. The above prices are f. o. b. Richmond, Va. We do not keep them in stock here.

HOW TO MAKE POTTING SOIL FOR GROWING BEAUTIFUL GERANIUMS.

We got a box of geraniums a few days ago that were so much ahead of any thing else I ever saw before in thrift, vigor, and rank luxuriance, as well as bud and bloom, that I wrote the grower for his recipe for making potting soil. Below is what he says about it:

The soil I use to grow them in is composed of one-half Jersey sand and one-half pure loam, with about 2 quarts of bone meal to the bushel. This sand was all washed out of the ocean at one time, and contains a good deal of fertilizing material in the way of phosphorus and very minute animalcules. Flowers do grow finely, out of it, and it is said they are more brilliant than anywhere else away from the seashore.

Ocean City, N. J., Feb. 20.

If you want to see the geraniums that are pleasing me so much, send to friend Moore for samples.

TWO NEW AND VALUABLE GARDEN VEGETABLES.

Our good friend Burpee was kind enough last season to send me a lot of seeds to test. I sent them up to our Michigan ranch, and when we got there we greatly enjoyed the finest green corn and wax beans I had

ever found before in my life. We laid it to the wonderful fertility of the virgin soil around our cabin in the woods. Unfortunately the labels were lost, so we could not name the varieties that pleased us so much; but in looking over Burpee's new catalog I recognized at once that the corn was his new "Cosmopolitan," and the bean was his new "Burpee's Brittle Wax." Not only was the quality extra, but the corn gave enormous ears, and the stalks went up over 6 feet high. In fact, they fed the carpenter's horses every day while he was building the cabin. The wax beans were loaded with pods, and kept on bearing clear into October. We have not seeds of these two valuable varieties this year, so if you want them you will have to send direct to Burpee, Philadelphia.

NEW BOOKS ON RURAL SUBJECTS.

There are so many of these nowadays, especially books on special subjects, and such extremely good ones too, that it almost bewilders one. The first we have is "Strawberry Culture," by our old friend Matthew Crawford. Price 10 cts. Now, any thing from the pen of friend Crawford is always valuable, and it is also interesting reading. This booklet of 60 pages is the boiled-down experience of years in testing and growing the best varieties of strawberries there are before the world. You can hardly name a plant friend Crawford has not tested on his grounds. Even though we have just put out a strawberry-book of our own, I am glad to see that friend Crawford has got in his book a number of bright hints that we did not get hold of at all. If this book had come out a little sooner I should have been glad to have noted them. We can mail the book from this office or you can get it of the M. Crawford Co., Cuyahoga Falls, Ohio. Although the author does a large business in selling plants he has not advertised his plants nor his business on any page of his book; in fact, you could not learn from it that he has any thing for sale at all.

The other book that delights my heart is entitled "The Cow Pea." It has 64 pages, a little larger than our strawberry-book, and some beautiful half-tone pictures. The book is a gem, and everybody who is at all interested in the wonderful things the cow pea is doing for agriculture, not only in the South but through many parts of the North as well, should send for it. I was almost disappointed to find there was no price on the book. When we were invited to make editorial mention of it the letter closed up with this:

Every reader can get a copy free by writing to the Superintendent of Experiment Farm, Southern Pines, N. C.

I suppose that the above means that every reader of GLEANINGS can have a copy of this beautiful and valuable publication free of charge by applying for it as above. I am inclined to think they will get "snowed under" with applications, especially after the book is seen.

Kind Words from our Customers.

GLEANINGS gets better and better, and it seems to contain more each number. D. W. ANDERSON.
Blacksburg, S. C.

THE TOBACCO HABIT AND THE CULTURE OF TOBACCO.

[On page 71 (Jan. 15) I suggested that a reform will come, even if it is true that three-fourths of all the men are using tobacco. Some of you may think I was a little "rattled" when I seemed to say that a one-fourth minority was going to rule the other three-fourths. Not "rattled" at all, dear friends. Even if three-fourths of our men are users of tobacco it does not follow by any means that the users are all in favor of having it grown and sold. The following kind word explains the situation better than I can do it myself.]

I wish Mr. A. I. Root could know how much I enjoy reading his Home Talks; and if he will only keep at the tobacco traffic I know of one at least who will try to give it up. I wish his sermons could be published broadcast over the land, for I know they would do an immense amount of good. May God spare him to this world for a long time yet, that he may continue his fight against sin and iniquity. If there is a man in this world that I admire for courage, it is the smiling face of a true Christian. W. C. WHITAKER.

Essex, Mass., Jan. 30.

Now Ready!

Sixty-four Page Catalog

of every thing bee-keepers need. Illustrated and fully described. Especially valuable to beginners for the information it contains. Send your address on a postal and get it now. Established 1884.

J. M. Jenkins,
Wetumpka, Elmore Co., Ala.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, thus: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My rice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present.—M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albinos, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Fees by the pound, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

The Jennie Atchley Co., Beeville, Tex.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apary, assuring BEST goods at the LOWEST prices, and prompt shipment. BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

NEW YORK.—Comb honey is now pretty well cleaned up, and what remains on the market is nearly all fancy and No. 1 white honey. The demand is fairly good at the following quotations: Fancy white, 14; No. 1, 13; No. 2, 12. Extracted remains dull at unchanged prices with plenty of supply. Beeswax firm at 29. We have just received the first large shipment of new crop Cuban honey; some in tall sections packed 20 combs to the crate, and some in square sections packed 32 combs to the crate, glassed front on one side, p'ain, no-beeway section. The honey was packed in shipping-carriers, containing eight of the large and nine of the small crates respectively, and arrived in first-class condition. The flavor of this honey is very fine; and as to the quality, some of it is fancy white, while others is of a yellowish tint. We shall be glad to hear from any bee-keeper interested in this.

HILDRETH & SEGELKEN.

March 8. 265-7 Greenwich St., New York City.

CHICAGO.—The decline noted in last quotations are still more pronounced at this time; large offerings of Western comb are pressing for consumption, which are difficult to place. Prices are nominally 13@14 for best white, with travel-stain and light amber 10@12. That which is candied is selling as low as 7, with the

partially candied at 9@10. No great amount of dark honey is offered. Extracted is steady in price but slow of sale; white, 5½@7; amber, 5¼@5¾; dark, 5, according to what it is gathered from, and quality. Beeswax in urgent demand at 30.

R. A. BURNETT & Co.,

March 7. 199 South Water St., Chicago, Ill.

CINCINNATI.—The general tone of the honey market is lower. Water-white comb honey sells from 14@14½, and is hard to obtain; extra fancy, 15. Extracted has weakened a little, and sells from 5@5½; fancy, 6@6½.

C. H. W. WEBER,

March 7. 2146 Central Ave., Cincinnati, Ohio.

DENVER.—Demand for comb honey has been slow of late, but market shows some improvement now. No. 1 white comb honey, \$2.65 to \$2.85 per case of 24 sections; No. 2, \$2.40 to \$2.65. Extracted, 7@7½. Beeswax, 22@26.

COLORADO HONEY-PRODUCERS' ASS'N,

Mar. 10. 1440 Market St., Denver, Col.

SAN FRANCISCO.—Comb honey, 10@12. Extracted, water white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 27½@30.

Feb. 27. E. H. SCHAEFFLE, Murphys, Calif.

BUFFALO.—Price of honey holds about steady, but demand slow. Fancy white comb, 15@16; A No. 1, 14@15; No. 1, 13½@14; No. 2, 12½@13; No. 3, 12@12½; dark, 11@12. Extracted white, 6½@7½; amber, 5½@6½; dark, 5@5½. Beeswax, 28@30.

W. C. TOWNSEND,

March 8. 84, 86 West Market St., Buffalo, N. Y.

BOSTON.—We beg to report a fairly good spring demand for comb honey, and from present indications stock will clean up in good shape. Prices range as follows: Fancy, 16; No. 1, 13@13½; No. 2, none. Extracted is in good supply and moves slowly. California, 7½.

BLAKE, SCOTT & LEE,

March 8. 31, 33 Commercial St., Boston, Mass.

SCHENECTADY.—No buckwheat and but very little white comb honey in our market, but owing to lateness of the season prices remain unchanged. Ample stock of white and some dark extracted still on hand. Prices unchanged. We quote fancy white, 15; No. 1, 13@14; buckwheat, 12@13. Extracted, light, 6½@7; dark, 6@6½.

CHAS. MCCULLOCH,

March 7. 1 Eagle St., Schenectady, N. Y.

DETROIT.—Fancy white comb honey, 14@15c; No. 1, 13@14; dark and amber, 11@13. Extracted white, 6½@7; dark and amber, 5½@6. Beeswax, 28@29.

Mar. 8. M. H. HUNT & SON, Bell Branch, Mich.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans.

B. WALKER, Clyde, Ill

FOR SALE.—8000 lbs. fancy and No. 1 comb honey.

WALTER MARTIN, Globeville, Colo.

FOR SALE.—Extracted honey from alfalfa, in 60-lb. cans, tinted or white, 7 cts. a lb. Also honey in small friction-top pails.

M. P. RHOADS, Las Animas, Col.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.80, per case of two 60-lb. cans, net.

ARKANSAS VALLEY APIARIES, Las Animas, Col.

FOR SALE.—Two grades fine amber honey at 6 and 6½c respectively, and white honey at 7½c per lb. f. o. b. here. Sample free.

O. H. TOWNSEND, Otsego, Mich.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.

WM. MORRIS, Las Animas, Col.

FOR SALE.—Extracted honey, from alfalfa, at 7c per pound. Send for sample.

D. S. JENKINS, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7c, in kegs and cans.

DR. C. L. PARKER

Sta. A, R. F. D., Syracuse, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.

SEAVEY & FLARSHHEIM,

1318-1324 Union Avenue, Kansas City, Mo.

Victor's Strain of Italian Bees Awarded the Diploma as Being the Best Bees at the Pan-American.

BUREAU OF AWARDS.

PAN-AMERICAN EXPOSITION, }
BUFFALO, NEW YORK U. S. A. }
February 12, 1902. }

Mr. W. O. Victor, Wharton, Texas.

Dear Sir:—I have the honor to advise you that a Diploma of Honorable Mention has been awarded to you for your exhibit of Italian bees at this Exposition.

Very respectfully, WM. I. BUCHANAN,
Director-General.

Orel L. Hershiser Bought of Me an Untested Queen. This is what He Says of Her Colony:

"They are very industrious characteristically marked, and extremely gentle. It was a daily experience and repeated many times daily, to go into the inclosure with interested visitors, at the Exposition, open the hive, full to overflowing with beautiful bees, the progeny of the queen you sent me, and handle them in the various manipulations of hunting out the queen; shaking the bees from the comb, as is done in extracting, showing the brood in all stages, etc., all without the use of a smoker or any thing else to quiet the bees, and I do not recollect that any one ever got a sting from any of them."

Of the bees I exhibited at the Pan-American, he says: "The nucleus you sent for exhibition and award was certainly very fine-looking bees, and, in my opinion, they deserve the award given them by the judges."

But Who is Mr. Hershiser?

See *Gleanings* of date of Feb'y 1, 1902, page 97. Send in your orders for queens, and in a short time, as Mr. Hershiser and hundreds of others are now doing, you, too, will be singing the praises of "Victor's Bees." Price lists on application.

W. O. VICTOR, Wharton, Tex.

Queen Specialist.

Order a Swarthmore Outfit Now, and

Rear Some Fine Queens

For Yourself This Summer.

Specialists use and recommend Swarthmore Queen-rearing Devices. Honey-produce are successful with queen-fertilizing attachments. Testimonials for the asking. Leading dealers will supply the Grace Cell-compressor, Improved Nursery, Fertilizing-boxes, Shell cups, etc., etc., or sent direct by addressing the Swarthmore Apiaries, Swarthmore, Pennsylvania. Orders booked now for Golden-all-over and 3-banded Queens and Bees. We export.

FOR SALE.—Thirty colonies of bees in new 8-frame Dovetailed hives, at Stockbridge, Mich., at \$2.50 per colony. W. D. SOPER, Jackson, Mich.

TEXAS QUEENS!!

From the Lone Star Apiaries, G. F. Davidson & Son, prop's, have made great preparations for the coming season to accommodate their many customers with either Long-tongue, Imported St ck, or Golden Queens. They have bought out the queen-rearing business of O. P. Hyde & Son, Hutto, Texas and by buying and increasing their

number of nuclei, they are better prepared than ever to cater to the trade of the bee-keeping public. One of Root's Long-tongue Breeders; Imported stock direct from Italy; Goldens from leading queen breeders. Fine breeders of each of the above have been added to their yards. Safe arrival and satisfaction guaranteed. Send for queen circular and price list. Address G. F. Davidson & Son, Box 190, Floresville, Texas.

TAR HEEL APIARIES.

Abbott L. Swinson, Queen-specialist in Charge. Orders filled now. For nuclei, 75c per L. frame—add price of queen. Bees, \$1.00 per lb. Warranted queens, \$1.00 each; \$10.00 per dozen. Tested, \$1.50. Breeders, \$5.00. We have 300 colonies of best American albino Italians and Adel bees. These bees have no superiors in the long-tongue or any others.

10 Vine Street.

Full line of all supplies manufactured by us.
Low freight and steamship rates to all points on
Atlantic Coast. Order early, be ready for spring.

G. B. LEWIS CO., WATERTOWN, WIS.

1902 Catalog Ready.

If you have not been receiving a copy annually, send us your name and address, and one will be mailed to you free.

Special Offer.

To parties sending us an order for supplies amounting to \$10.00 or more at regular prices we will make following low rates on journals:
Gleanings in Bee Culture, semi-monthly, 1 year, 50c.
American Bee Journal, weekly, 1 year . . . 70c.

Special Agency, C. M. Scott & Co., 1004 East Washington St., Indianapolis, Indiana.

AGENCIES: L. C. Woodman, Grand Rapids, Michigan; Fred W. Muth & Co., Southwest Corner Walnut & Front Sts., Cincinnati, Ohio; Fred Foulger & Sons, Ogden, Utah; Colorado Honey-producers' Association, Denver, Col.; Grand Junction Fruit-growers' Association, Grand Junction, Colorado; Robert Halley, Montrose, Colorado; Pierce Seed and Produce Company, Pueblo, Colo.; E. T. Abbott, St. Joseph, Missouri. Special Southwestern Agent, Charles Dadant & Son, Hamilton, Illinois; F. C. Erkel, 515 First Ave., N. E., Minneapolis, Minnesota; Lilly, Bogardus & Co., Seattle, Washington, Special Northwestern Agents.

BEE - SUPPLIES!

ROOT'S GOODS
AT
ROOT'S PRICES.

C. H. W. Weber, Cincinnati, Ohio.
2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1902 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

VOL. XXX

MAR. 15, 1902.

No. 6.

IN GRADING HONEY, D. W. Working says, in *Amer. Bee Journal*, that the first essential is honesty of purpose. Right! in other words, Bro. Working, to have a conscience in *working* order.

I ENVY A. I. Root his enjoyment in starting cuttings. I've been there. February and March are, I believe, the best months for it. Say, A. I., have you tried starting begonias from a leaf or a piece of a leaf? It's fun.

I DON'T KNOW whether to congratulate C. P. Dadant or the *Revue Internationale*, the very able French bee journal, upon the fact that the former is now a regular collaborator of the latter. I think I'll congratulate both.

IT IS NOT WISE in some cases to kill a queen, even when she is old. Mr. H. Trokay reports a queen whose workers in four poor years gave successively 174, 165, 209, and 77 lbs. But none of her progeny equalled her.—*L'Abcille*.

REFERRING TO A STRAW on p. 91, L. E. Kerr wishes it to be understood that, when he said "There are more bees kept to-day in the old-fashioned box hive than any other one style," he meant more than any one style of frame hives.

G. M. DOOLITTLE says, in the *Am. Bee Journal*, that he has had in one colony bees by the thousand live from Sept. 1 to July 1, an important factor in their longevity being their *quiet* wintering. [That is orthodox according to our experience.—ED.]

I RESENT the insinuation, Mr. Editor, that I go around with hands slippery with honey (see last Straw, p. 179), and I much prefer washing them with soil, which I often do. But that sharp edge makes it easier to hold a smoker, even if your hands have just been washed with soft water and Castile soap.

F. L. THOMPSON did a first-class job in making a summary of the recent discussions on breeding, for the Colorado convention. It occupies three pages of the *Amer. Bee Journal*, and is interesting reading, even if you have read the discussions in all the other bee journals.

JUST FOR ONCE, Mr. Editor, I'm going to leave to you the last word in the Langstroth-Dzierzon matter; but if your wife doesn't want to be a widow, I advise her to keep you out of Germany. [That may be; but residents of the United States are in good favor with Germany just now.—ED.]

THE *Bienen-Vater* quotes the figures for cleansing wax with acid, given on p. 947. Dear *Bienen-Vater*, that was a mistake. Editor Alfonsus, kindly correct as follows: Um dunkles Bienenwachs rein zu machen, meistens ein Zusatz von 1 Percent Schwefelsäure genügt, und zwar ein Theil Säure und 100 Theile Wasser. Besonders schmutziges Wachs erfordert aber bis zu 2 Percent Zusatz.

DANDELIONS are a different thing in Medina from what they are "in this locality," according to what is said of them, p. 185. I count much on both the honey and pollen. One year I *shook* 2 lbs. of thin dandelion honey out of the frames of one colony. [I do not remember to have ever seen so much honey which I was sure was from dandelions in any one comb. I suspect the trouble is, we have so many bees in one locality that there is not enough dandelion honey to go around to make much of a showing.—ED.]

THAT RECORD of only 4 qts. of dead bees on cellar floor Feb. 23 is very remarkable, page 184. About the same date, and with nearly the same number of colonies, I had swept up six times as many dead bees, and I thought I was doing unusually well. Say, Ernest, can't you put machine-shops on your price list? I want to buy one to winter bees under. [I have all along believed that we were securing remarkable results; but in order to get these results the doors are open every night, no matter how warm it is outside, and closed before

daylight. Our regular apiarist is an early riser and an early-to-bed man; and as he sleeps in our factory, the opening and closing of the doors works like clockwork. The bees in our outyard, in the bee-cellar, are not doing as well. The cellar is damp, and ventilation limited.—Ed.]

C. P. DADANT says in *Revue Internationale* that nearly all of the wax in the United States comes from the South, the reason being that the northern bee-keepers do more reading of bee journals and books. And I wonder if it is not also because there is a larger proportion of dark honey in the South, hence a larger proportion extracted. [Your supposition is correct. There is more dark honey in the South than in the North. In the extreme South, and especially in Cuba and Mexico, it is profitable to produce wax rather than a cheap grade of honey, by converting such honey into wax.—Ed.]

DR. H. E. FISK, principal of Northwest-ern Academy, an important institution near Chicago, has advised students, who can not give up cigarettes, to leave, offering to refund their tuition. He says only two per cent of cigarette-smokers are in the highest grade, while 57 per cent are in the lowest, while four-fifths of those who persist in the cigarette habit ultimately fail in their studies. [I was surprised and pained to read in the papers that Prince Henry, who is now paying us a complimentary visit, is a lover of cigarettes. Such figures as you give ought to stop any sensible man from continuing in the awful habit.—Ed.]

THE BURLINGTON RAILROAD has heretofore rigidly enforced the rule against the use of liquor by those who had any thing to do with the running of trains. Hereafter the rule will be enforced against the employees of all departments, including even the track, bridge, and building departments. Here's the rule for all: "The use of intoxicants by employees while on duty is prohibited. Their habitual use, or the frequenting of places where they are sold, is sufficient cause for dismissal." How is that, Ernest? [Yes, and there are a great many roads that are going still further. If a man is seen going into a saloon, that is sufficient cause for his dismissal providing he can not give a good and sufficient reason for going there. The time is not far distant when every road in the country will have these rulings; and when the great corporations that employ thousands of men take the same stand we shall put the whole saloon business where it belongs, and thus probably do actually more to prohibit the use of liquor than any laws that can be enacted.—Ed.]

THE MANY REPORTS in European journals of drugs curing foul brood certainly looks as though the disease were milder there. E. Bochaty reports in *Revue Internationale* a number of cases cured by dropping in the corner of the hive every three or four days 15 to 20 drops of the

essence of rosemary. [We have very little faith in the application of any drug, no matter how powerful, administered in such small quantities as in the manner stated. The fact is, I believe that many of our European friends are confusing foul brood with several forms of dead brood that are comparatively mild, and disappear themselves. Two-thirds of the brood that is submitted to us for examination is pickled brood or another form of dead brood that is found sometimes in the summer, but which goes off of itself. Pickled brood in northern localities will very often disappear, and one might pour in a few drops of rosemary, salicylic acid, carbolic acid, or even salt water, and, because the disease disappeared, as it would naturally of itself, he would conclude he had struck a great remedy. I am satisfied in my own mind that foul brood, such as I have seen, would never yield to such treatment as that.—Ed.]

"NOR DO I CONSIDER any Italian queen as pure." When Bro. Doolittle says that, p. 182. I think that what he *means* is true, but that what he *says* is not true unless he uses the word "pure" with some meaning other than that found in the dictionary. From what he has said in other places, I understand him to believe that no Italians are of an entirely fixed or permanent character, in which he is probably strictly correct. But I do not know that in the term "Italian" there is at all involved the idea of strict permanence of character. If a man should order a queen, saying, "I want a tested queen, for I want to be sure that I have nothing but pure Italian," I think Bro. Doolittle would be able to fill the order, and it would not surprise me if at some time he may have sold a queen that the purchaser supposed was "pure Italian." If there is no such thing as a pure Italian queen, there is an immense amount of correcting that should be done in our bee literature. In looking over a half-page in the A B C I found just nine such corrections needed. Moreover, if no Italian queen ever sold was pure, an immense number of frauds have been committed by men supposed to be honest.

Responsive to the sun's approach,
Life springs from Winter's death;
The birds return, the grass starts up,
Revived by Spring's warm breath.

The *Review of Reviews* says:

Apples from America and Tasmania can be sold at a profit in London, when apples growing a few miles out of the city are left to rot on the trees, because the railroad charges are so high that the farmers can not afford to send them to market.

Just how far that affects the producers of honey would be an interesting question.

It's a little strange how much the British suffer from the attacks of the English, for, as the Premier of New Zealand says, one person in every five in London either dies in the workhouse or lunatic asylum.

L'APICULTEUR.

As to the advisability of using an extractor, Mr. Maujean replies to Mr. Sylviac:

By the universal consent of bee-keepers, the extractor is useful. And this concession is not made because of its novelty. The farmer knows too well the value of money to buy an extractor on the affirmation of an author or the say-so of another party. It is remarkable that the old bee-men have all been converted to the extractor, and those who remain behind do not say, "I am not convinced," but, "I am too old to adopt a new system." This would be reason enough to decide a beginner. . . . The extractor furnishes advantages enough in one year to justify one in not going without it. Mr. Sylviac believes that a bee-keeper using frame hives does not get any more honey than one using simply an empty hive. Unfortunately for Mr. Sylviac he speaks without any experimental knowledge, as he admits he has never owned an extractor. The writer had, for four or five years, medium crops of honey, sometimes none at all. He was almost discouraged, when he had occasion to read Bertrand's "Management of the Apiary," when he began to use the extractor. That was in 1889, and immediately, as if by magic, it changed the whole aspect of things.

AMERICAN BEE JOURNAL.

P. H. Harbeck relates the following incident:

I positively know that king-birds catch queens, for I was out one day with a shotgun watching for Mr. Bird, and just when it caught a bee I let go; and when I picked it up I found in its bill a drone and queen hanging to it yet alive, only one wing being torn off by the shot. I took it back to the colony that swarmed, and put it at the entrance. There came about twenty bees, going for her as if they meant to pull her to pieces; but that was not the idea, for they pulled something away from her, and then every thing was all right, and the queen marched right in, and the bees were as happy as could be. Since then I have no mercy for king-birds. I may be wrong, but I think they are not a bee-keeper's friend.

Prof. Cook has finished his Home Circle talks, and I can not better express my own view of them than by saying "me too" after the following, from the pen of Mr. E. E. Hasty:

Exit "The Home Circle!" A surprise for us that was not agreeable. Gone, but not altogether forgotten, Prof. Cook may be assured. In the real home circle it oft happens that the one who is gone is, in a kind of way, more emphatically permanent and present than those who remain. We can hope that some of the tender sentences of our "Home Circle" may enjoy a portion of the same sort of immortality.

In the issue for March 6 is the second article from Miss Emma Wilson, on how to begin bee-keeping. Although designed for green hands, these sketches "bristle with good points," as the saying is, and even the veterans can read them with profit; for the best workmen are those who continually keep in sight the principles of their craft. As these articles come from the household of Dr. Miller we may suppose they have his "O. K."

GATHERED BY A BEE.

"Say, Doolittle, do you suppose we could tell how much honey a single bee would gather?"

"I doubt it. But I have often thought if we look at the matter in the right light such an item may be made of interest to us if we study it from the right standpoint."

"How so? You know it takes thousands upon thousands of them to do any thing to advantage by way of honey-gathering; and to study just what one bee would do would be to look into an almost infinitesimal matter."

"Yes, I know it takes thousands of bees to make much headway at storing honey, and this is just the very reason why many mistakes have been made in the past, and just the reason why there may be a profit in looking into the matter of how much honey a single bee may gather."

"What about the mistakes? I don't understand."

"Some have been telling us all along during the past, 'keep your colonies always strong,' just as though a large number of bees in a hive, at all times of the year, was the thing to be always sought after, and a thing of great value. But right here comes in another side to this 'gathering' question. We have just been saying that it takes thousands of bees to make much headway at gathering honey; yet in this locality we very rarely have a yield of honey lasting through the length of life allotted to an individual bee, while many bees — yea, more than half which are reared under the most skillful management, never add an ounce to our surplus product. If every bee reared could have a field of nectar placed before it in which to labor, then the motto, 'Keep your colonies *always* strong,' would be the right one; but inasmuch as this can not be, and as bees at all times must be consumers, no matter whether producing or not, I can not now and never have been able to see the philosophy of having a colony strong in bees at such seasons when of necessity they can only be consumers. The time to have our colonies strong, with thousands upon thousands of bees, till the 'measure is heaped up and running over,' is just when our field is yielding nectar."

"Well, this is something I never thought of before, and I think I do see now why colonies always strong may not be to the highest advantage to the bee-keeper."

"Then right here comes in another factor in this question, which is the field, or that from which our supply of nectar comes from. In reality we must begin with the field, or, in other words, place that first; for without the field, or nectar-flow, we have no use for the bees. With a continu-

ous and uninterrupted nectar-flow within two miles of the hive during the whole time in which a bee lives, I think that a single bee might easily gather one ounce of honey, which would take only 16 bees to gather one pound, or 1600 to gather 100 pounds. And, if this were so, then 16,000 bees would be able to gather 1000, so you will see that the reason our thousands upon thousands of bees do no better for us than they do lies right here in the field."

"Surely, I can not gainsay that. But the bees must live out of what they gather, must they not?"

"Certainly. And I calculate of that amount it takes at least one-fourth of that gathered to supply the wants of the colony during the time a single bee is living; and unless the nectar is thicker than we get it here it would take 3 pounds of this nectar to make one of honey. So, then, we should have 750 lbs. of honey as the product of 16,000 bees during their lifetime, with an uninterrupted flow of nectar. While this might be possible, there are two things which make it improbable, the first being, as already spoken of, that the honey-flow does not continue long enough, and, while it is on, it is interrupted more or less by unfavorable weather; and the second is, that the yield would not be sufficient within two miles of the apiary, where many colonies were kept, so that the bees could work to the best advantage."

"Where did you get any such idea of the amount a single bee might gather in its lifetime?"

"In one of my many experiments, conducted some years ago, I had a colony which, on May 25th, I estimated to contain 4000 bees of field-working age. This estimate was gotten by counting the bees on a given surface of comb, and then dividing the amount of comb covered with bees by the space counted, when the quotient was multiplied by the number of field-bees counted on the first surface. The next day was a fine one, and apple-bloom was yielding nectar as well as I ever knew it to. At 7 A. M. the bees began to go to work, and at 8 A. M. I found that, on an average, 60 loaded bees were going into the hive each minute. One was caught and killed, which I found, upon dissecting, had a fair-sized drop of nectar in the honey-sac. By a careful estimate and weighing I found that it would take about 3600 such bee-loads to make a pound, so I concluded that 4000 bees were good for the gathering of one pound of nectar each hour, besides caring for the interior of the hive as to what was there needed. Before a bee had left the hive in the morning I had weighed the same so that I could tell when night came how much nectar the colony had gained. They worked right along at the average rate of 60 per minute till 4 P. M., when they began to slack up, and at 5 P. M. all had quit work for the day, as the sun went behind clouds soon after 4 P. M. I now weighed the hive again, saying, as I did so, that, if my es-

timate was correct, it should weigh 8 lbs. more than it did in the morning."

"How near to the amount did you come?"

"I found that it weighed 8 lbs. 9 ounces, thus showing that my estimate was not far out of the way. But what was a great surprise to me was that, when weighed the next morning, I found that the 8 pounds 9 ounces gain of the day before had gone down to 3 lbs. 12 ounces, thus showing that the nectar just from the flowers was not all honey by any means."

"I suppose this set you trying to secure apple honey."

"Yes, I became infatuated with the idea that there could be as much honey obtained from apple-bloom as from basswood, if I could only succeed in getting the population of the hive up to 40,000 instead of 4000; so I began trying that old advised plan of having my bees always strong, especially in apple-bloom; but after an entire failure of apple honey for the next five years, on account of the trees failing to bloom a part of the time, and cold rainy weather during the years when they blossomed, and that at a cost to me of much extra work and stores, I gave the matter up, and came to the conclusion that the *always-strong* idea had not been fully looked into—only trying to have the bees strong so as to take advantage of the generally good weather, and the regular yearly bloom of the basswood, which is our main honey-flow here. But I see the time is up when I must leave to meet an appointment. Before going, however, I wish to say this for you to carry home to think about: First we have the field or location we are in, of which we should have a thorough knowledge; next we have the bees, which are to be secured to the maximum numbers, just in time to take advantage of the main honey-flow of our field; and, third, that a bee is of little value as a honey-gatherer only as it can be placed in the field of action just at the right time; hence we should not encourage brood-rearing at all other times, only in so much as is necessary that the life of the colony may be preserved in good condition for this main rush of brood to bring about the thousands upon thousands of bees just when they are wanted. In this way the quantity of honey which a bee can gather in a lifetime becomes of interest to us, that we may work assiduously to have that lifetime come when our field is yielding its greatest amount of nectar."

L. W. A., Texas.—You can induce comb-building in your locality—that is, providing the temperature does not go below 70 or 80, by feeding liberally sugar syrup, or any cheap honey you may have. The idea is to get the bees prosperous and fairly fat. I would not advise you to use any substance like tin to support the foundation for comb-building. We consider fine wire very much cheaper, and it answers all reasonable requirements.

REPORTS so far indicate general good wintering, and the prospects very favorable. The heavy snows in the North have put the ground in fine condition, and preserved the young clovers.

AS I have been taking so much space in GLEANINGS of late, it seems to me only fair that in this issue I should give our correspondents more room than usual, and I am, therefore, cutting down the editorial space.

THE bees in the cellar under the machine-shop are beginning to make a loud protest. The thermometer stands at 60. The noise would quiet down providing we could let in fresh air without also letting in the light. Too great warmth stirs up activity, with the result that the air is rendered more or less impure.

I AM not able to continue my series of travels in this issue, on account of the failure of the paper-mill to supply the right grade of paper to print the half-tones on, which we have been using of late. I expect to resume the series in our next issue; but in the mean time we are enabled to publish some articles that have been held back for want of space.

MR. W. FRANK MCCLURE, the well-known newspaper correspondent, and writer for a number of prominent magazines, such as the *Ladies' Home Journal*, *Review of Reviews*, *Country Life in America*, etc., called at the Home of the Honey-bees to gather some facts for a write-up that he has in contemplation. I spent nearly all day with him, explaining the modern methods of bee-keeping and some of the peculiar habits of bees. I then told him how the bee-keeping industry had been damaged by the comb-honey canard. He promised to set the facts forth through the newspapers for which he is a regular correspondent. At the same time, he proposes to prepare an article or two, with illustrations, for some of our leading magazines.

AN ASSURED HONEY CROP FROM CALIFORNIA.

JUST as our last issue was going to press, containing the statement that the long-looked-for California rains had not come, and that there would probably be no honey from California this year, we received several letters from our friends on the coast, to the effect that the long-expected rains had come, making in all about 9 inches, and that all the bee-keepers were wearing broad smiles. Some even went so far as to

say that the rains were as copious as those that came in 1884, but this, I think, must be a mistake. This kind of news, while it brings joy to our friends in the Golden State, may be depressing to the bee-keepers of the East; but we see no good that can come from concealing the fact, as it is bound to leak out. If there is to be a honey crop in California it should be known.

SHALL SWEET CLOVER BE OUTLAWED IN OHIO?

SECRETARY MASON, of the National Bee-keepers' Association, recently called my attention to the fact that a bill has been presented in the Ohio Legislature (House Bill 598), the purpose of which is to class certain plants as noxious weeds, and among the list is named sweet clover. Whenever complaint is made, the township trustees are directed to cut down, or cause to be cut down, all such weeds.

We immediately wrote to our Representative and Senator, stating that sweet clover is grown in the far West as a forage-plant on the arid lands where nothing else will grow; that among the progressive farmers of the East it is not regarded as a weed, and when it has attained a certain growth stock are turned loose in it. We also stated that our Ohio Agricultural Experiment Station at Wooster had issued a bulletin telling of the value of sweet clover, stating that it is not a noxious weed, and never ought to be outlawed. I wrote the Station, and received from Director Thorne the following letter:

OHIO AGRICULTURAL EXPERIMENT STATION,
C. E. THORNE, Director.

Wooster, O., March 10, 1902.

MR. A. I. Root, Medina, Ohio.
My dear Sir:—If you find any serious attempt to have sweet clover declared a noxious weed, please let me know. I should consider such a declaration about as wise as one to call red clover such a weed and will fight it with all my might. I was one of the first to call attention to the peculiar habit of this plant of growing on soils where no other plant will thrive, a little article of mine on this point having been published as far back as 1877, and quoted throughout the range of the agricultural press.

Yours truly,

(Dic. L.) CHAS. E. THORNE, Director.

Since the above was written I have received other assurances from the Director that he will use his influence against so foolish a measure.

Our subscribers in Ohio are requested to write at once to their Representatives and Senators. Do not put it off, but do it now as soon as you read this, otherwise your protest may be too late.

In the mean time bee-keepers of other States would do well to watch their legislatures to see what they are doing. There has been an effort made to class sweet clover as a noxious weed in several States. Wherever such laws have been passed, so far as I know they have been repealed; but there are certain old-fashioned farmers who call it a weed, and every once in a while they manage to get in a bill before the legislature providing for its annihilation.

MARKETING COMB HONEY.

The Secret of Getting Good Prices; Slipshod Methods.

BY M. BROWN.

Mr. Root:—Your editorial on page 909, scoring honey-producers for their sluggish (and in part it may be called corrupt) practice is timely, and ought to have a wide circulation, because it is of great importance to honest producers and in stimulating the markets. I am not a large producer, nor one who has had large experience in bee-keeping, dating back for only three years. When I began three years ago I had to peddle out my honey in order to get 15 cents per pound for nice white comb; 10 to 12½ cents was the market price, so considered, for all classes of honey. The second year nearly all my honey was sold at my house at an average of 17½ cents per pound, which very much encouraged me, and was a source of pleasure.

On the 8th of May last, my number of colonies had increased from 7 in 1899 to 60, with full supers of nice white honey. I was compelled to try again the markets. Peddling was out of the question. I crated my honey under the rules laid down in GLEANINGS, in three grades; loaded my wagon, and called on our best groceries, offering to leave a crate with them. Most of them had honey out of commission houses, and did not want any at 15 cents when they could buy it at 11, to which I replied that I simply asked their permission to deposit a crate of my honey by the side of what they had; and if they could not sell it in a reasonable time and pay me 15 cents for it I would take the honey back, and pay them storage if they desired. My address with guarantee was written on the crate with that understanding. My honey was soon deposited. I went about my work, and, bless you! two days afterward a grocery wagon came in front of my yard with an order for 200 pounds of just such honey as I had deposited with them, with an invitation to come and get my pay, and 16 cents was agreed upon for fancy white and No. 1 of any kind of my grading. Four houses got all my honey this season, and I had to make but one trip to the city to sell my crop.

But here comes what I wanted to tell: Other producers came to me and asked me to sell their honey for them, saying they could get but from 10 to 12½ for theirs, and wanted to turn it over to me at that price, to which I finally consented. But, let me tell you, I soon learned that it would not do at all to attach one's name to another man's product. I had to be good and take back a large part of my friends' honey.

One consignment from an old bee-keeping friend from a distance was, I am sorry to say, an outrageous conglomeration, clearly exhibiting an incentive to deceive, or for immediate profit, regardless of honor or repute. Our market at present is flooded. Agents with consignments arrived, and are drumming it out in all parts of the city at from 10 to 12½ cents; but my customers will not handle any of it at any price. One of my customers who has been in the grocery business all his life said to me a few days ago that he had not the least idea that so much honey could be consumed provided a fine article in nice condition was offered. His experience showed him that a nice article will bring fancy prices and largely increase the consumption. He said, "Your honey sells at the rate of one crate per day, while with commission-house honey three to four crates last a whole season; and I must say that, if you bee-keepers were more honest, your markets would vastly improve, and the consumption of honey would displace the so-called fancy syrups which are a manufactured poison at the best."

Now, Mr. Editor, being only a small producer, my argument provoked by your recent editorial can not produce much weight in correcting the evils that exist. But it does seem to me that, if there were a little more honesty practiced, together with more intellectual practice, all would be vastly benefited in the end by producing a larger consumption and a more staple and uniform price. Every poor or bad section of comb honey put on the market acts as a drawback in the market instead of a stimulant. The actor in the drama may be profited immediately; but when he again has honey to sell he must very likely seek another buyer, and may succeed in finding one, and may keep that up for a period; but what does he do toward increasing the consumption of honey, and improving the market? Well, they have done this: They have disgusted the consumer by placing an inedible chunk of honey before him; they have discouraged the merchant, flooded him with complaints from his customers, and actually caused him to lose good customers of his house by the sale of inedible honey so treacherously concealed in crates, and unsuspectingly unloaded on them.

Now, Mr. Editor, I have no interest in this matter; the honey that I produce will always find a good market; but that inclination to deceive others in this manner is rampant, and is very damaging to bee-keepers' interests—I mean to those of honor and integrity; besides, it largely tends to demoralize the markets, which affects all producers; and I for one would advise those in that habit to quit the business and go and do something for which they are better fitted.

There is one other matter that interests me, which is that of statistics. I see the thing is up, and ought to have been up long ago; but I would say on this subject that the National Bee-keepers' Association

should be the one authority to take the honey statistics of this country, if the bee-keepers wish to derive any benefit from it. It will not be difficult for our journals to locate the producers and send them proper blanks to be filled out and returned at a given date to the secretary to be compiled and published under the authority of the organization. You will find it more reliable than any thing else you can get. My reason for making this statement is that I have been a statistical correspondent for more than 20 years, and have fully enjoyed the honor and the profits of the position, which would average about 10 cents a year in seeds. I do not wish to cast any reflection upon the head of the division; on the contrary, Mr. John Hyde is doing wonders with the means at his command. Suppose the department would add a honey column to its blanks now sent out, not one in 500 sent out would be filled out practically, intelligently, and with reliability. A statistical correspondent should be a practical as well as experienced man, and at times will have to lose time to procure correct information on certain subjects. I made many trips, and lost time and horse hire thrown in, for the benefit of the good and generous public; but I do not believe there are many who will lose time to procure correct information to give to the good public, just for the honor of the thing. On the other hand, if the National Bee-keepers' Association sends out blanks to practical bee-keepers, nine out of every ten will make a correct report; will take pleasure in returning the best information obtainable, because they will all be interested in the reports, and it will not all or nearly all be guesswork and exaggeration.

Little Rock, Ark., Nov. 25.

(Those who make a business of buying and selling know only too well that the great mass of bee-keepers do not understand the importance of putting up a first-class article. The great bulk of the comb honey that goes on to the market is unscrapped, a great deal of it is travel-stained, and much of it is poorly filled out, and, as a consequence, it goes begging; but a really first-class gilt-edge comb honey will sell on sight at good prices.

Yes, we do need reliable statistics, and I hope things may shape themselves in such a manner that the National Association can take hold of it.—ED.)

QUEENS REARED UNDER THE SWARMING IMPULSE.

Fertilizing Queens in Upper Stories; a Simple and Practical Plan for Grafting Cells.

BY F. GREINER.

What interests the honey-producer most is how to get a good crop of honey. He will leave no stone unturned to secure it. The wise and experienced bee-keeper also

knows that he must have his colonies in as good condition when the honey season arrives as is possible and practical. One of the essential things to get the colonies into best condition is, to have good queens. In buying queens we do not have full assurance that we are getting good queens. If we raise them ourselves, we at least know what the parentage is on the mother's side. We can select our breeding mothers. We also know that they have been handled carefully.

It is often said queens reared under the swarming impulse are better than such as are reared at other times or under different conditions. How true this is I do not know. This much, however, I do know: Queens may be reared during this swarming-period more easily than at other times, so I prefer to rear them for my own use during June and July, the regular swarming months. If the weather is favorable the last third of the month of May, when the apple-trees and other fruit-trees are blooming, then is a favorable time to begin.

Some honey-producers will use swarming-cells from any of their colonies. I did this myself years ago, but such a practice can not be recommended. There will always be found a very few colonies in a yard that outstrip the rest, not only in the larger honey-yield but also in their milder temperament, better markings, color, or other good qualities. From such we should breed, providing we are satisfied the stock is of pure blood, be it Italian, German, or other blood. I usually select one or two queens to breed from. The colonies containing them need not be crippled by drawing on them for brood. Since we have become familiar with the newer methods it is not even necessary to mutilate brood-combs to obtain brood for our purpose. By means of some simple and suitable tool, I prefer to use a small camel-hair brush. We can remove young larvæ from any brood-comb containing them, without difficulty, and without the least injury. This trick of transferring larvæ is not a very late discovery. It was first brought out by Mehring, a German, who is known as the inventor of comb foundation. He had found difficulty in having certain colonies start queen-cells from selected brood, they seeming to be bound to use their own for the purpose. He finally hit on the idea of supplanting the larvæ in the cells started with other larvæ from his selected stock, and he succeeded in thus fooling the obstinate colonies. For some reason Mehring's discovery did not then become universally known, but of late years has become a general practice. I do not know that it is necessary to say much more in regard to this art or trick; still, I will tell just how I proceed.

In the first place I go to my breeding colony and get a brood-comb containing young larvæ. Almost any comb contains some at this time of the year. This I take to my workshop, and place it upon a cloth-covered board in front of the window. In order

to let the light fall into the deep worker-cells it may be necessary to tip up slightly the brood-comb (board and all). I then select a larva of proper age or size, insert the little brush into the cell containing it, and, by a twisting motion, pick up the larva which adheres to the tip of the brush. It is then transferred to one of the artificial cups by my side. With a twisting motion the brush is quickly withdrawn and the job is done. Each cup is thus stocked up. The comb of brood is then returned to the colony it was taken from.

A colony which is making preparations to swarm is well suited to build our cells, or, in other words, rear our queens; but in order to be on the sure side I always remove the queen from such a one, and also several of the brood combs. Those that are left have to be looked over for cells once or twice, till the danger of cells being started on them is past. Immediately after the queen has been removed, a vacant place for one comb is made in the center of the brood-nest. A brood-frame is so fitted by cutting notches in the end-bars on the inside as to admit the insertion of three or even four bars parallel with the top-bar, the first one being about $\frac{3}{8}$ inch below the top-bar, the next one 2 inches below the first one, the third one 2 inches lower than the second, etc. These middle bars, as I call them, are provided their whole length with narrow strips of comb, and to these are glued artificial queen-cups (from 15 to 18). The strip of comb is used in order that the queen-cells, when ripe, may be easily cut from their bars without any risk of injuring the cells. Only one bar with its 15 or 18 cells is given to the prepared colony at this time or at one time. These cups have been provided with a little jelly before they were stocked up with young larvæ. The queenless bees are very apt to accept about every larva given, and will at once proceed to lengthen out the cells and feed the larvæ.

If a great many cells are wanted as quickly as possible, such accepted cells may be given to any other colony to finish. Said colony should have brood in an upper story with queen-excluder between lower and upper, and queen in the lower. The colony from which the accepted cells are taken must then be supplied with a second set of newly stocked-up cups, which, when accepted, may be removed and finished by another colony, etc. Ordinarily I make the queenless colony not only start but also finish the cells. In this case a new set of stocked-up cups are given every third day, so that, after a while, there will be cells of various ages in this one hive. It is very necessary that a careful record be kept of these cells; and as soon as they have come near maturity they must be removed.

The arrangement, as I have described it, makes this removal very easy. All we have to do is to slip out the bar with cells attached; and, if we are ready for it, insert another in its place with fresh queen-cups, as spoken of several times before. A colo-

ny may be kept at building cells in this way for a long time, providing a comb of brood is given it from time to time. It goes without saying that these combs must also be kept track of, for it is not impossible that cells may be started on them by the bees in addition to those we give them.

On the eighth or ninth day after giving a comb of brood the same is looked over, and what cells may have been started are removed. It is, however, rare that any are found. The bees seem to be satisfied with those artificial cells we give them from time to time.

We have now gotten as far as to have the cells, some of them, near maturity. After having had some experience in the matter of selecting larvæ for queen-rearing we shall be able to select such as are of proper and uniform age, and we shall also be able to determine very nearly when each set of cells will hatch. We all know the raising or producing of the cells is the most inexpensive part of the business. The expensive part is having our young queens fertilized. I was once very enthusiastic on the Doolittle plan of getting the queens fertilized from upper stories with full normal colonies below. Now, while I have not been successful practically in this I will relate briefly how I proceeded. It may prevent some one going over the same ground, and be saving money and time; or some one may be able to tell me or suggest why I have failed, and give the remedy.

The upper stories, as I used them, were made as follows: They were half-story bodies, divided into three compartments by wood division-boards nailed in solidly. Each division or chamber was sufficient to hold two or three combs. Each wood division-board had a piece of queen-excluding zinc inserted. There was also a zinc excluder nailed under each story, so there was a connection, vertically, between the brood-chamber and these apartments above as well as laterally between the apartments. For the sake of experiment, some of the upper stories had the central chamber *only* connected by zinc with the brood-nest below. Wire screen was used to prevent any direct connection between the outside chambers above and the brood-nest below. By not putting a queen into these central chambers you can readily see a queen can in no way meet another queen except by having fine-meshed wire screen between them. I had great faith in this last arrangement if not in the other. In addition to this I also tried these queen-fertilizing chambers on colonies that had cast swarms, so that there were *only* young queens in the hive. I stocked up a number of these chambers. Some I placed on top of supers where bees were working in sections. While I succeeded in getting a few queens fertilized, on the whole it was a failure, and for years I have made no use of the fertilizing stories or bodies. In fact, I have not hit on any plan (*the Swarthmore included*) by which to get queens fertilized,

except by the old-style nucleus plan, which I need not describe here.

Where colonies are allowed to swarm naturally a very good use may be made of our matured cells by giving each mother colony, after swarming, one of these—removing, of course, all other cells they may have in their hive. It may be found necessary, some time after, to look each colony over again for cells, and remove them, if colony is not treated by the Heddon plan. On the whole I rather like this way of propagating our best stock. All colonies that swarm can thus be easily provided with queens from superior stock.

Naples, N. Y.

[Queens reared under the swarming impulse are, as a general thing, large and vigorous, although I believe it is possible, under proper management, to produce artificial conditions to secure queens that will be just as good; but those conditions must combine some of nature's plans.

Your plan of grafting cells is, I believe, simple and practical. We have done a great deal of grafting—in fact, we believe all progressive queen-breeders make a practice of it, because there is no way by which selected stock can be secured in a wholesale way except by this plan.

We have tried all methods of having queens fertilized in the upper story; but when perforated zinc only is used between the upper and lower stories, or between the several compartments, the plan is liable to prove a failure. But we have been very successful in using upper stories by separating the brood-nest from the supers by means of wire cloth, then making each compartment "upstairs" entirely distinct and separate. On this plan the warmth of the cluster below rises up through the wire cloth into the nuclei above. This enables us to use weaker nuclei. So far our results in getting queens fertilized by this plan have been very satisfactory.—ED.]

THE SWINSON JUMBO HIVE.

A Peculiar Arrangement.

BY ABBOTT L. SWINSON.

Mr. Root:—In response to a request of yours I send you herewith prints of our "Jumbo" hive, which is intended either for comb or extracted honey, and which will excel any other hive I ever saw for the production of honey in any form. Its chief advantages are, in brief, plenty of room without (constant) changes during a honey-flow for a good yield. In sections where the flow is heavy and of short duration it beats the world. This characteristic feature of the entire South shows up the qualities of this hive, A No. 1; bees may store 112 lbs. of honey by climbing up to the skies to do it, and hence it is done, and done without loss of time. Honey will remain longer on the hives without discoloring. One person may

produce twice as much honey within a limited period. There is much less clustering of bees on the sections after they are completed, etc. We had several colonies that produced 140 lbs. of comb to the hive, inside of four weeks, last spring.

This shows the brood-chamber with 10 L. frames, with one raised and leaning against the cover of the hive, which sits on end on the ground, with the top side to the front. The top side of the frames comes perfectly level with the top edges of the hive.

This shows an end view of hive on stand, and closed. By this it may be seen that the surplus apartment is twice the width of the brood-chamber, and is cleated on top of the brood-chamber by close fitting of the bottom plank of the surplus apartment. This manner of fitting brings the bottom of the *inside* of surplus apartment on a level with the top side of the brood-frames in the brood-chamber. The cover is made gable-shaped, as shown, and ceiled with

thin boards crosswise, and so arranged as to have a cleated edge all around it to prevent its blowing off.

This shows the hive with the surplus apartment filled with 112 sections, size $1\frac{1}{8} \times 4\frac{1}{4} \times 4\frac{1}{4}$, contained in two section-cases (containing 56 sections each), sitting one on top of the other.

This shows the surplus apartment filled with 20 L. frames of combs, as arranged for increase or for extracted honey either.

One of the combs is raised up, and sits on top in full view. The brood-chamber takes 10 L. frames, and the surplus apartment 20 frames or 112 sections, size $1\frac{1}{8} \times 4\frac{1}{4} \times 4\frac{1}{4}$, either as the operator prefers.

The inside of the brood-chamber is 15 inches. The inside of the surplus apartment is 30 inches.

This hive is a model of my own, and fitted for best results by practical experience of years. Where you want either plenty of surplus room in a short space of time for a good yield, 112 lbs. of honey, without disturbing your bees to put in more sections during a honey-flow, or plenty of room without notice, the entire season, when the yield doesn't exceed 112 lbs., it allows you to do your work before honey-flow begins for whole season, to 112 lbs. per colony.

Macon, Ga., Jan. 24.

[This particular hive seems to violate all the principles laid down in hive-construction in modern bee culture. It appears to be a cross between the Long-idea hive and the regular ten-frame Langstroth. Notwithstanding its peculiarities, Mr. Swinson, I know, produces a great deal of honey, for he orders a lot of stuff to put that honey in, and we must, therefore, judge the hive, not by its looks, but by what it does. Taking it all in all, I doubt whether the average bee-keeper in average localities would secure as good results in such a hive as those obtainable from the ordinary standard hive on the market.]

It has been laid down as a general principle that the surplus part of a hive should not *extend over and beyond* the brood below. In other words, the top of the hive or the super should be no wider and no longer than the brood-nest.

Our chaff hives of years ago made use of an overhanging super; and I used to notice that the wide frames containing the sections in that part of the super not directly over the brood-frames below would not begin to be as well filled as those directly over the brood-nest; and in northern localities, at least, subject to cool nights, I should expect that very little surplus would be stored in the overhanging parts of the super.

Another principle that has been laid down is that it is a mistake to give the bees too much surplus room *at the start*. For that reason, all section devices were, about ten or fifteen years ago, cut down to single tier. One tier of sections is put on; and, when the bees get well at work in it, it is lifted up and another super put under it. Mr. Doolittle has for years been strenuously advocating the giving of but little surplus room at a time. He even goes so far as to put on only two or three wide frames (single tier) at a time, in case of the weaker colonies, and then adds wide frame by wide frame as the honey-flow advances.

While I believe and know that Mr. Swinson's hive answers his purpose admirably, yet I doubt whether it would do in the average locality in the North.—Ed.]

TONGUE-LENGTH AND TONGUE-REACH.

An Explanation.

BY PROF. C. P. GILLETTE.

How easy it is to be misunderstood! In my paper upon "Long-tongued Honey-bees," I seem to have been misunderstood in two important particulars. The first is in regard to the relation existing between tongue-length and tongue-reach. In the current volume of GLEANINGS, page 8, the editor, in commenting upon my measurements of bees' tongues, says, "It seems there is no fixed relation between total length of tongue and tongue-reach." Dr. Miller, in the number for Feb. 15, page 145, says, "One thing that seems to be settled is that tongue-reach is not determined by tongue-length," and refers to my measurements to prove the statement. Similar comments have been made in print by others.

I tried to explain in my paper that I had found it unsatisfactory to depend upon tongue-reach directly measured, as I believed the measurements could not be depended upon as being very accurate. I stated that, "If the tongue-reach seemed too short when first measured, I could usually increase it by two or three hundredths of an inch by a little careful stretching." This is not a real stretching, but a straightening of the joints of the organ which tend to close upon one another like the closing of a pocket-knife. I also said, "I have considered the entire tongue-length the best measurement upon which to base conclusions as to tongue-reach." Also, "I believe, for practical purposes, it may always be considered true that the bee with the longest tongue has the longest possible tongue-reach."

I place no value whatever upon my measurements of tongue-reach except to show how variable and unreliable such measurements are. If any one thinks a bee with a shorter tongue can outreach another bee with a longer tongue, the burden of proof lies with him to show that such is the case, for it seems very unreasonable that it could be true. Is there any real evidence whatever that such is the case?

The other point I wished to mention is that some writers in bee-journals seem to think that I expressed the opinion that bees do not gather honey from red clover. I simply asked a very timid question. These are the words: "It makes me wonder if it is possible that those who think bees have gathered honey from red clover can be mistaken," and then followed the remark, "This is only a suggestion."

In this connection I might correct a wrong impression that the editor of GLEANINGS has in regard to the variation in length of tongue of bumble-bees corresponding to the age of the bees. In his comments upon my paper on page 17 of the present volume, the editor says, "Apparently the tongue-length of bumble-bees varies considerably. This might be accounted for by the difference in

age of the bumble-bees measured. It will be remembered that the bees of *Apis mellifica*, when a week old, are as large as they ever will be, while those of *Bombus* vary in size considerably, according to age." The bumble-bee does not grow after leaving the cell any more than a honey-bee. The small bumble-bees in a nest are the workers; the very large ones in the same nest are queens, and the queens have longer tongues than the workers. This is not surprising, as the queens are also workers, and have to do all the work of the nest or colony in the spring until workers are reared to help her, then she stays in the nest, for the most part, and the little workers go out to collect nectar and pollen. There are many species of bumble-bees also in the same locality, and these vary much in size and coloration.

The State Agricultural College,

Fort Collins, Colorado, March 7.

[What Prof. Gillette says is a good deal true; but in measuring tongue-reach there is one of our workmen who would get the same results as myself, and we both measured according to the same plan. But I can readily see that two different people attempting to follow the same directions *might* measure the same tongue and get different results so far as tongue-reach is concerned. In my own experience a certain kind of combing of the tongue will bring it just so far and no further; and my own measurements showed there was quite a variation in tongue-reach.

With regard to the honey in red clover, my only purpose in referring to it was that some who read what you said, even though it was merely a suggestion, might get the impression that there was *no* honey in red clover. I merely desired to state that it was definitely proven that red clover did contain, some seasons, large quantities of honey.—ED.]

SELLING HONEY.

Plain, Practical Advice from a Practical Man.

BY ADRIAN GETAZ.

So much has been written on this subject it is almost needless to go over the ground again. In this paper I will mention only a few points which have not received sufficient attention.

Honey can be sold to four different classes of buyers: 1. The wholesale merchants; 2. The commission merchants; 3. The retailers or grocers; 4. The consumers.

Selling to the consumers is generally called "peddling." Between the two first classes of buyers there is little choice. I would say that the ability and integrity of the parties should be the principal consideration.

If there is doubt as to the honesty of the buyer, the commission merchant would be the safer. The dishonest dealer who buys outright may get your honey and never pay.

All the recourse you have in such cases is to sue, get a judgment, pay the costs, and—*get your money if you can.*

The commission merchant has to make some kind of returns that the courts will accept, otherwise he may be criminally indicted for breach of trust, and perhaps be sent to the penitentiary. Very few among the more or less dishonest men will risk going to the "pen."

Selling to the grocers is, I think, the most advisable course after all, at least in the majority of cases. It will take some time and some trouble at the beginning; but after a sufficient number of good customers is secured it will not take any more work to ship to them than to the wholesale dealers. Better not sell too much on credit to any one man until you know positively he is all right. Cash sales can not always be secured. The grocer may not have the cash at hand. In fact, the grocers have to sell almost altogether on credit, and often wait quite a while for their money. The result is that they are frequently "hard up" for cash.

Often a grocer will not or can not buy; but very often, in such cases, he will take honey on commission, to be paid for when sold. The commission varies from two to three cents per pound. If his customers like the honey, and he finds profit in selling it, it is easy to make a better arrangement a little later.

The question may now be asked, whether it is best to sell near home or in the large cities. Many writers have insisted that the home market should be developed. That is all right where it can be done. The trouble is that, in villages and small cities, the specialist has to meet the competition of farmers and other slipshod bee-keepers who sell their honey for whatever they can get. A great many writers have abused the grocers for buying such honey, and at such prices, and refusing to pay more for the specialist's honey. But the grocers can't help it. They can not pay you 18 cents for your honey and resell it at 20 when their customers know well that they can themselves buy directly from the farmers at 15 or perhaps 12 cents. In large cities the farmer is out of it for lack of tidiness in his arrangements.

The honey in a wholesale or commission house has to be sold altogether on its appearance; hence the necessity of having crates, cases, sections, grading, etc., all in tiptop order. In selling directly to the grocers the honey can be tasted, and sold on its quality; and after the grocer and his customers know your honey to be good they will not mind if it is a little off color, or if the sections are not very carefully scraped.

In selling near home the freight is saved, also the cost of cases, crates, packing, etc., or at least a part of it. When sent a short distance the honey can be put into any kind of boxes; or if cases are used, they may be returned. That means a saving of something like 1½ or 2 cents a pound.

If the crop is not large, and the apiarist has nothing better to do, he can peddle the honey, and put into his own pocket the two or three cents per pound profit that the grocer would have made. I say, *if* he has nothing better to do. Generally speaking, peddling is slow work. One chief reason is that the majority of people keep but little money at home. They buy at the groceries, dry-goods stores, etc., all they need on credit, and pay at the end of the month or any other convenient time. The result is, they can not buy much for cash. Selling such small quantities on credit is out of the question, except with a few well-known customers. The boarding-houses, hotels, etc., will buy large quantities, but they do not want to pay retail prices.

But sometimes, in good seasons, the grocers are so well supplied that they can not buy, and peddling may have to be resorted to. There is an advantage in peddling extracted honey. It can be tasted, and, if found good, many people will buy at a price not very much below that of comb honey, and a larger profit made than could be on comb honey.

As to producing first-class honey and retailing it to private customers above the market price, I may say that I have not succeeded very well. Very few people will pay above the market price, and I have found the sales too slow to be profitable, and finally abandoned the scheme.

Here comes the question of buying honey and selling it to consumers. That is peddling within the legal meaning of that word, if the honey is carried from house to house, and sold there and then to whoever chooses to buy it.

Peddling in Tennessee is subject to a prohibitive license of several hundred dollars, and equally heavy fines and imprisonment are provided against the transgressors of the law. However, the courts of the United States have decided that a merchant has a right to solicit orders, either directly or by employing agents or commercial travelers, and also to deliver the goods sold, either himself or his employees. The result is, that a man can procure a merchant license (it is only \$3.00 per year here), go around and take orders, and return later to deliver the goods ordered. A farmer or tiller of the ground (and that term includes bee-keepers, poultry-raisers, etc.) can sell what he raises to whoever he pleases, without license, even grape or blackberry wine.

Commercial travelers tell me that substantially the same laws exist in all the States of the Union. The above may explain why Messrs. Moore, Niver, and others always employ two men—one to take orders, and the other following to deliver the honey ordered.

Knoxville, Tenn.

[This is an excellent article, and as it covers the ground so thoroughly we expect to have it struck off in pamphlet form.—Ed.]

RAMBLE 198.

Morro Castle and the Wreck of the Maine; The Immense Honey Resources of Cuba; Cuban Extracted and Cuban Comb Honey, and Their Effect on the United States Markets.

BY RAMBLER.

Sometimes we stumble upon surprises, sometimes they are thrust upon us, and sometimes we bring them upon ourselves.

It was through a combination of all these methods that I found myself, on the early morning of Nov. 19, on the forward deck of the steamship Aransas with half a hundred deeply interested fellow-passengers, passing the historic Morro Castle and Cabanas fortress, and into Havana harbor, the capital city of the "Gem of the Antilles."

After feasting our eyes upon massive stone battlements and protruding cannon "to the right of us and to the left of us," our attention was directed further up the harbor to the wreck of the Maine. As our steamer slowly passed and anchored near it there was scarcely a word from the crowd of passengers. All, like the Rambler, had their eyes riveted upon the bent and misshapen ironwork of the cruel wreck, and were thinking of over two hundred American sailors who were there dropped suddenly into eternity.

But, the anchor down, then came the hustle to get ashore. We were transferred to a small harbor boat, and were duly strained through the custom-house with our various belongings. As we had no contraband goods aboard we were not unduly detained.

To a person who has been living in one of the newest and up-to-date cities of the far West, with broad streets and ample sidewalks, neat cottages and ground around them, laid out in artistic design, it is indeed a strange experience to drop into a city like Havana, with its narrow stone-paved streets, stone buildings, marble floors, tile roofs, and windows protected with iron rods and wooden shutters instead of glass. While crossing streets it was not long until I was measuring their width by pacing. In the business portion of the city the width does not vary much from seven paces, and this includes the sidewalks. Many of the latter are only one foot wide. The trucking on these streets is nearly all done on

immense two-wheeled carts drawn by mules. There is just about room enough for two to pass; and as a big wheel chucks toward you on that narrow sidewalk you feel as though you ought to get out of the way; but you are safe, as that stone curbing checks the wheel when the big hub is within an inch of your clothing.

Just as I began to feel the need of a little more breathing-space I emerged upon a wide avenue in the center of the city, known as the Prado, with parks and seats for thousands of people. After finding a lodging-house and breakfast, the next consideration was The A. I. Root Co.'s headquarters. I entertained the idea that a center for supplies would be a center where beekeepers most do congregate, and found said center upon Obrapia Street; and with the genial manager, Mr. F. H. DeBeche, I felt very much at home, and fully so when surrounded by all of the modern appurtenances of bee-keeping.

In studying up the honey resources of a country it is well to consider the amount and variety of supplies sold and the honey shipped. When in Oregon and Washington a few years ago I found that, though a few carloads of supplies were sold from the Root headquarters in Portland, there were quantities of honey being shipped in from Utah and California. From this it was self-evident that those northwestern States were not great in honey-production. From the amount of supplies on hand on Obrapia St., Havana, I considered the honey business in a healthful condition. A few days later I called at 14 Obrapia St., and found the place vacant. Mr. DeBeche, finding his rooms too confined, had moved about a block away to No. 17 San Ignacio St., where a large building had been rented, and well filled with a new and large invoice of supplies. I then knew that the honey business was no small matter in Cuba.

During the past year California, at a conservative estimate, produced 5,000,000

lbs. As nearly as I can learn as to the Cuban crop for the past year, it has been equal to if not more than the California yield.

I doubt if California ever produced 10,000,000 lbs.; but I am credibly informed that, before the war, when there were more apiaries than at present, the product was over that amount in Cuba.

A marked difference in the yields of California and Cuba is that the former often has failures, but the latter none. The smaller area, then, of Cuba can be put into the front ranks as a producer.

At present virtually all of the honey produced is liquid, and probably $\frac{3}{4}$ of it is handled by one firm in Havana—Bridat-Montros Co. Price prevailing at present is 34 to 37 cents per gallon. This honey nearly all goes to Europe.

Our friends in the States, I fear, are casting envious eyes toward Cuba, and think-

So far as my observation goes, honey is extracted too green; the combs are but slightly capped. Extracted in the coolest portion of the year, there is but slight evaporation in the tank, and none where it is put immediately into tierces. The same honey, under a California sun, might become equal in flavor to the best in the land. I am confident, however, that there will be a great change in the near future in the production of honey in this island. Comb honey will come to the front, and I am sure the States can absorb large amounts of it at fair prices. Cuban comb honey is thoroughly ripened, and fit for table use. I would, therefore, caution the friends in the States not to hold this Cuban honey trade before their eyes as an immense lion. Lions are mostly terrible in anticipation; and, getting down to the birth of such lions, are they not born of selfishness?

Havana being the chief seaport of the is-

THE CRAYCRAFT AND DE BECHE APIARY; PUENTES GRANDES.

ing that a change to low tariff or free trade will allow a flood of honey to flow into their markets. Certainly honey is cheap enough now in the States, and it might temporarily affect the market should the several million pounds produced in Cuba be added to a large crop in the States; but the latter do not get large crops every year. Then here is this foreign safety-valve against ruinously low prices.

I believe that, with the 20 cts. per gallon duty off, there would be but little change in the marketing and prices of Cuban extracted honey. It is used in foreign countries for manufacturing purposes, and, although my Cuban friends protest when I say so, I must say that Cuban extracted honey will not find favor in the States as a table honey beside California or New York honey.

land, and the chief landing-place for Americans, there are quite a number of bee-keepers in and near the city, and several United States employees and professional men are interested in bees.

The readers of GLEANINGS are familiar with the name of Fred Craycraft. He is a bee-keeper of many years' experience in Cuba; and, though at present holding a good position in the custom-house, he is still interested in the busy bee.

Mr. DeBeche, manager of the A. I. Root supply-house, and Mr. Craycraft are jointly interested in two large apiaries—one at Puentes Grandes, near Havana, and the other at San Jose, 25 miles out. These apiaries are directly cared for by native Cubans, while the owners go out holidays and Sundays to see that things are moving; and I judge they are not afraid, when occasion

requires, to take hold and help *make* things move.

In one of their apiaries they are producing some beautiful comb honey; and if this is marketed successfully their apiaries will probably be devoted largely, in the future, to that grade of honey.

TIERCES OF HONEY ON HAVANA WHARF, READY FOR SHIPMENT.

I herewith present a view of the Puentes Grandes apiary and the surroundings. We get a glimpse of a little river below, and a portion of a tile-covered stone building of uncertain age.

Here is also a view of The Root Co.'s supply-house, not so much to show the Root sign as to show the street with its narrow sidewalk and the style of house with its prison-like windows. In fact, there are but few glass windows in all Havana. The upper portion of these stone houses is very pleasant and roomy, with lofty ceilings and marble floors. There was one mistake made in this photo. Mr. DeBeche first and Mr. Craycraft second are on the far end of

SUPPLY-HOUSE OF THE A. I. ROOT COMPANY, HAVANA.

the balcony, when they should have been upon the near end. It is all owing to the fact that Mr. Craycraft is a very modest and retiring man. There were some ladies coming down the street, and he was afraid he might be captured.

The gentlemen are both bachelors, and have their den off the said balcony. Lady bee-keepers should remember the number—17 San Ignacio St.

EXPORTATION OF HONEY AND WAX FROM CUBAN PORTS DURING 1901.

COUNTRIES.	HONEY.		WAX.	
	Pounds.	Value.	Pounds.	Value.
United States.....	1,317,222	\$ 50,956	176,384	\$ 40,446
Spain	15,040	500	882	150
France	1,009,755	42,559	204,352	58,350
Germany.....	1,500,790	58,263	619,240	166,214
United Kingdom....	246,847	8,894	7,761	1,215
Amer. Countries....			600	200
Europ'n Countries...	695,871	27,648	13,378	3,913
Other Countries....	10,075	529		
Total	4,795,600	\$ 189,349	1,022,897	\$ 270,488

In several respects the above statistics are deceptive. While the aggregate amounts are correct, the amounts credited to different countries are wrong in this respect: The greater portion of the 1,317,222 lbs. shipped to the United States was first shipped to the port of New York, and from there re-shipped to Germany. It is the same, only in a little less degree, with the honey shipped to France. Germany at last gets the bulk of it.

TELEGONY.

The Influence of the Male on Succeeding Offspring Not Sired by Him ; is the Theory Proven ?

BY PROF. A. J. COOK.

I am always much interested in reading GLEANINGS. I was especially attracted to the communication from W. E. Head, on p. 60, and also in your comments. You agree with Mr. Head in the statement that telegony is thoroughly established as a correct theory. I am exceedingly skeptical regarding the cases given by Mr. Head. I feel quite certain that reversion, not telegony, must explain them. If telegony be true at all, I believe it speaks with muffled voice and never in loud accents. May I present the matter to your readers, as it is very important in practical affairs? The belief in it once reduced the value of a cow in my herd many dollars. I believe there were no just grounds for this loss.

The theory of telegony is very important to breeders. The name originated quite recently with Weismann. Telegony teaches that a taint is given a female by mating with a male of different breed or race. To illustrate, a mare bears a foal from a jack. If the theory of telegony be true, any subsequent foal from that mare, even though sired by a horse, will very likely show mule characteristics. Again, a shorthorn cow is crossed with a Jersey bull. All future off-

spring, even from pure shorthorn, are likely to show the Jersey taint.

That there was some such theory in the minds of people as early as Jacob's time is possibly true. The theory has been regarded by many of our scientists as a correct one, back even to 1820, when Lord Morton wrote to Dr. W. H. Woolston, President of the Royal Society of Great Britain, the results of his famous experiments. These experiments were substantially as follows:

A nearly pure Arabian mare was coupled with a quagga. The resulting offspring was a female hybrid quite intermediate in character between the sire and the dam. The mare was afterward bred to a pure Arabian horse. The resulting filly, in the words of Lord Morton, and also a colt a year younger, were fine specimens of the Arabian breed, as fine as could be expected when only fifteen-sixteenths Arabian; but in the color and the hair of their manes they bore striking resemblance to the quagga. The stripes seemed quite conclusive, but the evidence from the main and tail was less so. This testimony from Lord Morton has been regarded as conclusive by many scientific men. Darwin, in referring to this case, says, "There can be no doubt that the quagga affected the character of the offspring subsequently got by the Arabian horse." It is significant, however, that Darwin wrote afterward that telegony occurred rarely; for he stated, some years before his death, that it was "a very occasional phenomenon." Agassiz believed in telegony. He was fully persuaded, to use his own words, "that the act of fecundation is not an act which is limited in its effects, but that it is an act that affects the whole system, the sexual system especially, and in the sexual system the ovary to be impregnated hereafter is so modified by the first act that later impregnations do not efface the first impressions." Romanes also believed that telegony was of occasional occurrence. His researches were quite extensive. He sums up his conclusions in the following words: "The phenomenon is of much less frequent occurrence than is generally supposed. I doubt if it occurs in more than one or two cases in a hundred." Herber Spencer believed in telegony. He not only has a theory to explain it, but also makes it the basis of an extended argument which he used in his controversy with Weismann. The latter, who gave us the term "telegony," writes as follows in the *Contemporary Review*:

"I must say that, to this day, and in spite of the additional cases brought forward by Spencer and Romanes, I do not consider that telegony has been proved. I should accept a case like that of Lord Morton's mare as satisfactory evidence if it were quite certainly beyond a doubt. But this is by no means the case, as Settegast has abundantly proved."

Settegast explained the case in question as an instance of "reversion." He says, "Cases are not rare where colts are born

with stripes which recall the marking of a quagga or zebra." Many German breeders hold with Weismann that telegony is yet unproved.

The late Sir Everett Millais, an eminent breeder of dogs in England, was also a doubter. He says:

"I may further adduce the fact that, in a breeding experience of nearly thirty years' standing, during which I made all sorts of experiments with pure-blood dams and wild-blood sires, and returned them afterward to pure sires of their own breed, I have never seen a case of telegony, nor has my breeding stock suffered. I may further adduce the fact that I have made over fifty experiments for Prof. Romanes, to induce a case of telegony in a variety of animals—dogs, ducks, hens, pigeons, etc., but I have hopelessly failed, as has every experimenter who has tried to produce the phenomenon."

Very recently Prof. Ewart used Matopo, a beautiful zebra stallion. He has secured eleven zebra hybrids, from mares of various breeds and sizes. Some of these hybrids were even more marked with stripes than the sire. The mares were afterward bred to horses. The progeny were for the most part very much like ordinary foals. There were, however, stripes, which in some cases were quite evident in certain lights, but even these in many cases disappeared later. It is interesting to note, however, that these faint stripes were unlike those of the sire or even the hybrids. Foals of ordinary breeding very often show similar stripes. Many of the colts show no stripes at all, nor any indication of taint. Prof. Ewart has also experimented with pigeons, fowls, ducks, and dogs. There were many cases of rabbits, and in every case the mother which had been impurely mated subsequently bred true upon being purely mated. Prof. Ewart does not claim to have proved any thing. He is certain that it does not always occur, and believes with German breeders that, if it occurs at all, it is seldom. We quote from him: "The experiments, as far as they have gone, afford no evidence in support of the telegony hypothesis." He believes that the stripes are easily explained by atavism or reversion. Certainly we owe a great debt of gratitude to this Edinburgh professor. Very recently Prof. Ewart gave the results of further experiments to the same purpose.

The late Dr. Manly Miles, in his "Principles of Stock-breeding," accepts telegony. He gives a case in his own breeding. An Essex sow was bred to a Chester White boar. She was afterward mated purely, and produced a litter of pigs which were as much mixed black and white as the previous litter. I was at the time a colleague of Dr. Miles, and with many others had grave doubts regarding the experiment. A careless work-hand, the accidental opening of a gate, so many things would explain the result without an appeal to telegony. The taint was so great that it could not but

make one skeptical. I can not but feel the same way regarding Mr. Head's report in GLEANINGS.

As is well known, many poultry-men and apiarists argue that the law of telephony is as true of birds and bees as of mammals. I have long doubted its truth with poultry, or our pets of the hive. Telephony was at first explained as blood taint in the case of mammals; but there is no intermixture of the blood of the mother and the embryo. An extensive membrane in the placenta separates entirely the blood of mother and fœtus. Blood taint is obviously impossible. The nerves were next appealed to to explain this phenomenon. This, however, is vain, as the nerves of mother and offspring are entirely separate. Dr. Miles called in cell inoculation to explain telephony. We all know how inflammation spreads in the case of wounds. The explanation is evident. Poison, or possibly microbes, pass from the injured to the uninjured cells, and, with the spread of the cause of the disease, the disease spreads. In telephony there is no virus, and so there could be no inoculation. Herbert Spencer suggests that "germ-plasm" passes from the fœtus to the mother and becomes a part of her body, and spreads to affect all the tissues, even the reproductive organs. This is surely very hypothetical.

I was led to question the truth of telephony, as the testimony seemed as conclusive with birds and bees as with mammals. Mr. Spencer's germ-plasm could not affect in these latter cases. With fowls, only the sperm-cells are lodged, and that for a brief space, in the oviduct of the hen. There is no organic connection, and it is hard to see how any influence could taint the hen. I know it is claimed with some show of authority that impure mating changes the color of the eggshell. I can only say, very interesting if true. If such a change occurs, I believe reversion explains it. In the case of bees the connection is a little more obvious. Here millions of sperm-cells are lodged for years in the spermatheca, or sperm-sac, of the queen. There is, however, no difference in kind from the fowls—the only difference is in time. The sperm-cells are present in the reproductive apparatus for years instead of days.

So grave were my doubts that I experimented at length to see if I might decide the matter. My experiments with poultry were made with Light Brahmas and Brown Leghorns. These birds are different in limb, feather, form, habit, and color of egg. The fowls all ran together through the winter, mating promiscuously. In early spring I separated the birds, putting all the Leghorns, male and female, in one pen and the Brahmas in another. After three weeks I commenced to incubate the eggs, and raised over 200 chickens. There was not the least show of taint in either breed. We all know how persistent the feathers on the legs are with any show of Brahma blood. My Leghorns had legs that were

entirely clean. At the close of these experiments I was more skeptical than ever as to the truth of telephony in birds. Noted breeders of long experience in our country make similar reports.

I next experimented with bees. I procured a queen all the way from Syria. I introduced her in my apiary where there were only Italians. I at once reared several queens from her which must have been mated exclusively with Italian drones, as there were no Syrian drones within hundreds of miles. As is well known, drones hatch from unimpregnated eggs. Here, then, if the drones from these queens should show any Italian taint, we should have positive proof of telephony in bees. The eggs, not being impregnated, can produce only drones that have the characteristics of the mother. If impure, then surely the mother must be affected. In this case we have examples, not by the tens nor the hundreds, but by the thousands. I examined these drones very carefully, as did my students and many others. Every drone was decidedly Syrian, and had not the slightest mark of an Italian. Have we not, then, good reason to doubt the truth of telephony in bees?

I have known several cases among mammals where telephony might be put in evidence if true; yet in every case the evidence was absent. I know this is only negative testimony. I went to the Chicago exhibition during the time that mules were being exhibited. I talked with many extensive breeders, and not one believed in telephony. They all said that they had had no evidence of its truth.

As stated at the beginning of this article, this is a matter of no little importance to the breeder. If telephony be true, then accidental cross-mating with any female for ever taints her blood. I am so firm in the belief that it is not true that I would not pay one nickel less for a shorthorn or Jersey because, at some time in the past, she had been impurely mated.

Claremont, Cal., Feb., 1902.

EXPLOSIVE COMPARISONS.

Breeding from Freaks; Dr. Miller and Mr. Doolittle Put on the Witness Stand; Difficulties in Improving Stock.

BY ARTHUR C. MILLER.

[The following article was written for our Jan. 1st issue, but owing to the large amount of matter on hand we were not able to get to it till now.—ED.]

Just what the editor was trying to do when he compiled the copy for the issue of Dec. 15 is a conundrum. He at least succeeded in gathering together a most excellent lot of explosives if properly combined. Let me see if I can make the combination. P. 972 Dr. Miller says: "F. B. Simpson, in the *Review*, stands sponsor himself for the idea that freak-best queens should not be selected to breed from, and tells me to come on with my brickbats. Well, here comes one,

F. B. G. M. Doolittle says that for thirty years he has followed the plan of breeding from the best (and, if I understand him correctly, the more of a freak a queen was by way of securing exceptional yields, the better she suited him as a breeder), and as a result he has not only brought up his average, but has secured a much greater uniformity in the yields of different colonies."

Dr. Miller's witness, Mr. Doolittle, has for years told of the great labor and pains he is at to get all his colonies of a uniform strength in the spring; told of its importance in getting *more uniform* results in honey crop. Also on page 975, Dec. 15, he says he has been keeping bees for 33 years, and again refers to his effort at stimulating this year (1901), keeping the feeding up until the 15th of June. On p. 976 he tells of his average yield from colonies not drawn on for queen-rearing was 175 to 180 lbs. He omits giving the number of colonies. Next he mentions four colonies, the tongues of the bees of which measured from 25.4 hundredths to 25.8 hundredths of an inch, the difference, 4 one-thousandths, being infinitesimal. Incidentally he says the honey-flow was the greatest in his experience. Now, from these four colonies the yield was 317 lbs., 54 lbs., 105 lbs., and 93 lbs. And this is *uniformity*! The tongue length was uniform enough; and unless Mr. Doolittle's skill has failed him the colonies started of uniform strength. Dr. Miller was unfortunate in his selection of a witness. On the strength of the evidence Mr. Simpson wins.

But here are some further combinations. Mr. Doolittle says his care in selecting his breeding stock (extreme freaks) has raised his average honey-yield, and made the returns per colony "*more uniform*." Great Scott! what were the previous *extremes*? This selecting has been done inside of 33 years; he has been able to select only the females, the males being practically beyond control. By his own statements the bulk of his queen-rearing is done during the height of the honey season—a time when drones are abundant in all colonies, particularly in his neighbors' yards and in *wild* stocks.

To digress a little: Taking any species of animal from its wild state, changing its environment, food, etc., selecting both the males and females, and it is, even under such favorable conditions, years before any perceptible variation is secured. To digress further: Certain species of birds that were known to exist under the same conditions in the same locality for over 3000 years, and free to mate as they choose, have not varied so far as can be perceived.

To return to the bees: Our bees to-day are living under practically the same conditions that they have lived under since man has known of them—over 2000 years of written records. We have not been able to change their habits, and we are able to select only the females. To claim that radical changes in structure and habit in a desired direction could under these conditions be secured in 33 years is, scientifically, an

absurdity. In a neatly satirical article in GLEANINGS for Dec. 15, p. 973, Mr. S. E. Miller has shown the folly of making any such claim or of deceiving oneself by any such delusion.

Mr. Doolittle has recently called particular attention to his 33 years of experience, and to what he honestly believes he has learned and accomplished in that time. He alludes to this long experience in the opening paragraph of his article, p. 975. On p. 983 the editor tells of a young and not robust lad who, from a start of 7 colonies, has increased to over 500 colonies in *five years*. Mr. Editor, you should be careful how you put the ingredients for such explosive comparisons in the same issue.

I do not make these comparisons for the purpose of ridiculing any one. Mr. Doolittle is a facile writer, and is popular with many readers; but I think he has shown that, in spite of his years of bee-keeping, he is not successful in making correct deductions from the facts before him. It is not his fault, but, rather, his misfortune.

Dr. Miller is an entertaining writer, a successful bee-keeper, and probably has more friends among the bee-keepers than any other living man; but if we may judge from his own communications he is not "up" on the latest accepted beliefs on breeding, on development, and on heredity. With his many duties and his advancing years it is not to be expected that he could be. But he and Mr. Doolittle are far from being alone in misinterpreting the results obtained under different methods and varying conditions. We have before us a very complex problem. We desire to increase our honey-yields, and practically all progressive bee-keepers (including Dr. Miller and Mr. Doolittle) are, I think, agreed that, to accomplish that result, we must have improved strains of bees. To obtain such we must breed from stock *selected* because of its excellence in the desired direction. But how shall the selection be made? Evidently, tongue length isn't all, nor is uniformity of strength in colonies a safe basis for comparison, nor is extent of honey-flow an aid. Evidently, the first thing we have got to do is to teach ourselves *how* and *what* to observe. We have got to study the same individual colonies for at least two whole successive years—one won't do. By experience and the careful comparison of the results of many observers we must learn what factors have weight and what may be ignored. We are dealing with conditions which call for keen eyes, and minds able to discern all possible factors. The results must be clearly and concisely stated. Generalities will not do; broad assertions will not do, and offhand assumptions will not do. And while we are learning to observe we may busy ourselves still further in trying to discover a satisfactory method of controlling mating. This we have got to have; for, to expect to advance in a specific direction by the selection of the females, without ability to control the males, is like

Mrs. Partington trying to mop up the Atlantic. To be sure, under exceptional conditions (as on a small island) we may be able to make some progress; for under such conditions we should be practically controlling the males. But what would the product of many such islands amount to when distributed through the apiaries of our land? The Atlantic, as before, would beat Mrs. Partington. We have this much in our favor (and it is a good deal): Our bees have begun to vary *perceptibly*. This, I think, is chiefly due to our introducing to our temperate clime bees of the tropics, and the crossing of them with the native stock. (Scientifically speaking, variation is continuous, though by no means always definable). If we acquire the ability to select intelligently, and at the same time have an effective way of controlling mating, we may reasonably hope to reap some of the benefits of our improved strain of bees within the lifetime of many of us, and not leave it all for coming generations.

From information in my hands I believe the day of controlled mating is not far distant, though I am not yet at liberty to disclose the facts or source of the information on which I base this belief.

Providence, R. I., Dec. 21.

HAY VS. HONEY.

Alfalfa Cut Before Blooming; no Honey.

BY J. A. GREEN.

A note of warning was sounded in the Dec. 1st number of GLEANINGS in regard to the probable decrease in the yield of honey from alfalfa, that may be pondered over very profitably by those who depend on this source, or who are thinking of locating in alfalfa regions with the idea of securing a more certain source of honey. I have lately returned from a trip through the West, during which I paid particular attention to the alfalfa question. When I learned, in Southern California, that there were districts where alfalfa was the main crop, I thought that I had found the ideal country for a bee-keeper, and I hastened to investigate. I had not felt particularly attracted toward bee-keeping as generally practiced in California, where the apiarist lives a secluded life up some almost inaccessible canyon, and depends for his bread and butter and honey upon a rainfall that is far more capricious than that in the Eastern States. But this country is comparatively thickly settled, and with a honey source that was almost certain; and since it depended on irrigation rather than the chance of the seasons, it seemed to offer special advantages to the apiarist. I accordingly procured a bicycle and started on an exploring-tour. I found the alfalfa country all right, and learned at first hand some of the possibilities of this wonderful plant in that land of sunshine. In this district most of the water is pumped from wells.

Many of the pumps are operated by electricity derived from an electric wire run through the valley for this express purpose, while others are run by gasoline-engines or other sources of power. Alfalfa-raising was evidently a profitable business. But I saw no bees. "All the better," I thought. "This is unoccupied territory. The alfalfa business is new here, and the bee-keepers have not got in here yet." But I made inquiries.

"Are there no bees here?"

"Lots of them up in the foot-hills and canyons. No bees around here."

"But I should think that, with so much alfalfa around here, there would be lots of bees."

"Never heard of its being any good for bees. Don't think they get any honey from it."

Mystified, I went to the bee-keepers.

"No, alfalfa doesn't yield honey in this country. It is no good at all for bees here."

A little investigation showed the reason. The alfalfa business was so profitable that it was run as a specialty. In that favored climate, with plenty of water, six or seven crops a year were cut. Better hay, and more of it, was secured by early cutting. Small farms were the rule. Good livings were being made from pieces of land that, to the hay-raiser of the Mississippi Valley, would seem ridiculously small. The result of all this was that, just as soon as the alfalfa was ready to cut, the mower was started. The proper time for this seemed to be, in their opinion, just as soon as the blossoms appeared, or a little sooner. With the small farms, divided into fields so managed as to come on in succession—an easy matter where the climate is always the same and water regulated at will—cutting did not last over a day or two. The honey-yield is nipped in the bud, as it were, and a colony of bees might starve in the midst of an alfalfa district, if it were not for the few stray plants along the irrigating-ditches, which escape cutting.

I afterward learned that there were other parts of California where alfalfa is the source of considerable honey. Here the farms are larger, and it is the custom to delay cutting longer. In Idaho and Colorado, where alfalfa is the main source of honey, it seems to be the custom not to begin cutting until the alfalfa is well in bloom; and as the fields are large, the bees have a number of days to gather honey. The tendency, though, is to cut earlier, and this tendency is likely to increase as the farmers find they can get more hay of a better quality by early cutting. Some with whom I talked thought that, with the large fields that were the rule in their locality, cutting would always last so long that there was little danger of the yield of honey being materially lessened. But, without question, alfalfa must in most places be less reliable as a source of honey in the future than it has been in the past.

Ottawa, Ill., Dec. 10.

COMMENTS ON RAMBLER'S TROUBLES.

Alfalfa, Why it Fails to Yield Honey at Times; Rambler's Wee-waw Hives; the Heddon Hive.

BY W. A. H. GILSTRAP.

Rambler's writings have a peculiar attraction to me. When he was writing of California honey conditions from the south end of the State it was trying on our nerves. We can write all we please about apicultural conditions to GLEANINGS, and still our Southern California friends seem to know but little about the greatest mountain-inclosed valley of the world. The way Rambler writes on page 977 shows that he has spent some time in our valley, and we will not quarrel with him for being in California so long before he learned of our section. As I slung honey fifteen or twenty miles west of Rambler's retreat for several years, and alfalfa honey in other localities as well, perhaps my experience and observation would help the traveling man the next time he comes our way.

To my mind, alfalfa is a desert plant. If it is excessively flooded it is thrown out of its normal condition, and makes poor success as a flower or honey producer, and almost completely fails for seed. These conditions are more pronounced on some soils than others, and it is evidently influenced by the atmosphere. The weather that is best for honey production in New York is not normal summer weather here, and will not give best results. Mr. Doolittle has said that the honey season is better with occasional thunder showers, I believe. It will not work here "a little bit." Alfalfa is said to be a poor honey-producer in the Northern States. That could be expected of a dry-weather plant. Perhaps sweet clover is a good honey-producer nearly anywhere.

But some seasons alfalfa presents an abundance of fragrant blossoms which look all right, and yet very little honey is produced. Why? The most striking case of the kind that I have observed was when an unusual amount of lightning was noticeable. This led me to believe that an excess of electricity in the atmosphere was detrimental to honey production. This view has been strengthened since, but still there is a question as to this theory being reliable. Who knows?

But the great enemy to alfalfa-honey production is the change in cutting the crop. I have not heard of a farmer who has tried making hay of very young alfalfa who has changed back to his former plan of allowing it to stand in bloom quite a while.

"The great problem in this valley is to learn how to hold the bees in when they want to increase, and make them increase when they don't want to" (page 978). As you, Mr. Rambler, are a Heddon-hive crank (me too), you would probably contract the brood-chamber to one case about the last week in August. In the spring

you would turn the queen loose with that rather light colony. As they would not get strong enough to swarm, with empty combs present, until the "starving time," they would still try to get extra strength, and perhaps would be your strongest colonies early in the honey-flow.

Now, Rambler, that brings us to wee-waw hives. The name "astral hives," from a prominent word on many of the hives, may go into oblivion, so far as I am concerned. You certainly never tried to move bees in such hives. As there is hardly anything to nail to you can not nail them tight. As they are sure to be warped and split, tying is a failure. Do the best you can, and then some bees will come out and push you off the wagon. But if you want to enjoy life, just ship some bees in wee-waw hives by rail. I tried it once.

But there is one redeeming feature about them. When a man gets 300 or 400 wee-waw hives he buys a ranch or improved town property, or loans money out at interest. Did you ever know it to fail? Perhaps these old rattle-trap hives will give better results in average hands than the best Dovetailed hives made, as you are sure of ventilation. Let me illustrate.

A friend of mine, a good bee-keeper too, ran short of good hives during swarming one spring, and then put the rest of his swarms in old discarded hives that were quite leaky. To his surprise the bees in the leaky hives stored more honey than those in the tight hives—more ventilation. In this locality we need good bees and good worker comb. The outside part of the hive is of less consequence. Of course, this is a matter of locality.

Grayson, Cal., Jan. 6.

[As I went through the alfalfa districts last summer I heard a great deal about getting the roots of the plants too wet or too dry. In some localities it seems to thrive more vigorously than in others. While the soil and climate may have some thing to do with the bloom, yet it was very evident that the method of handling and watering had also much to do with it.

But the matter that is of great concern to the bee-keeping interests is the increasing tendency on the part of farmers or ranchers to cut the hay before it comes into bloom. If this practice continues at the rate at which it has begun, it will be only a question of time when the great alfalfa-growing regions will become less and less known as honey localities; and the alfalfa honey which we prize so highly will have to come from those fields where the plant is cultivated for seed. Some regions are devoted entirely to seed-growing; and when a bee-keeper can get into one of these localities he has a bonanza—or, as some of them told me, a "snap." The general practice at the present time is to cut the alfalfa after it has been in bloom for a few days. If it were only to the interest of the hay-grower to let the plant continue on through the

blooming season, and *then* cut, twice as much honey might be secured, perhaps. But I fear the matter is working the other way. It is well, therefore, for those who think of going to the West, to consider most seriously whether the production of alfalfa honey will not be largely a thing of the past. If I am setting forth the situation worse than Mr. Green or Mr. Gilstrap have in their article (and I think I am not) I should be glad to be corrected.

The time may come, however, when bee-keepers can afford to pay the ranchmen something for letting their hay crop go into bloom before cutting. Whether that would be feasible or not remains to be seen.—ED.]

“DOOLITTLE'S FOUR COLONIES; A QUESTION ASKED.”

Why Some Colonies Gather More Honey than Others; Brood-rearing under Control.

BY G. M. DOOLITTLE.

Under the above heading, Mr. W. C. Eastwood, in the January 15th issue, has this to say: “Should not G. M. Doolittle, in that communication of his, ‘The season of 1901,’ page 976, when giving his account of the comparative test of those four lots of bees as to the length of their tongues, and honey product, have furnished us an explicit statement of the quantity of bees and brood in each hive at the start? He has left us to assume that all started even, but he does not say so. The omission is a serious one. It renders the account given valueless. . . . The comparison made is not between the total amounts gathered by the several colonies, but between the amount of their several surpluses over and above the quantity needed for the support of each colony—quite a different thing. . . . And the editor adds, Mr. Doolittle says the four were worked as nearly alike as possible. He might mean by this that they were nearly alike in brood and bees; but the statement, as you say, is not explicit.”

When we come to technicalities, both of the above are right; yet I expected it would be inferred, as was really the case, that the four colonies were as near alike as “two peas,” by the words “were worked as nearly alike as possible,” for, surely, no one would think of comparing colonies of unequal strength on the start. No, the trouble was not in the colonies being of unequal strength the first of May, but was in just the thing touched on by Mr. E. in his last sentence quoted. Quite likely all four of the colonies may have gathered somewhere near the same amount from the field, but of what use was that? It is only the *surplus* which counts to the one keeping bees for profit. I really thought, on June first, that the colony which gave the least surplus was the one which was going to do wonders for me. And why? Because it had the nicest lot of brood, and that in the most compact shape. And why did it not

do the best? Ah, there is the rub. And right here is the thing which most bee-keepers have failed to grasp in their breeding and selection: That supposedly better colony used nearly all of its energy *rearing brood* when the honey harvest arrived, which resulted in a host of restless bees, which began to swarm in the height of the honey harvest. And at brood-rearing they kept, and day after day they would swarm, in spite of all Doolittle could do, without upsetting the plan started with, and upon which the others were worked, until the whole season was frittered away (except 40 lbs. of poor surplus) in this brood, and the swarming of the bees, which became useless consumers later on, so that there was not honey enough for winter stores. Will Bro. Eastwood—yes, or any one else, tell me what use there is of bees, gathering from the fields, using the honey in such a way as that?

Now let us come to the other colony that gave the 261 lbs. of surplus, all nice for market. What of those? They put in good licks at brood-rearing, up to the time the honey-flow had been on for about a week, when the brood gradually lessened down to just enough to keep the colony in good condition for wintering, while every energy was bent in putting in all the nectar possible as a surplus, supposedly for themselves, but which I took advantage of at a rate of \$33.42, and after that they had double the amount they required for winter. “No use talking, brethren,” the queen that will put her bees on the stage of action, in a maximum number or amount, right at the beginning of the honey-flow, then decrease her brood so that this brood, and the bees from it, shall not consume a larger share of the nectar gathered, while the maximum amount of bees work energetically, with little or no swarming, for the accumulation of a surplus—such a queen is of more value than any other *one* thing in all the realm of bee-keeping, if not more than all of the other things combined. And this is the *one* thing I have been breeding for, and the result of the season of 1901 proved that I had not worked in vain. The queen colony which is susceptible to the manipulation of the apiarist along the line above spoken of is a *power* in the apiarist's hands to roll up untold amounts of honey. But the colony which is not susceptible to such manipulation will prove to be a disappointment the larger part of the time. And I wish to thank Mr. Eastwood for drawing this matter out. Here is something I have been trying to get the brethren to think *seriously* about for many years, but my words have seemed to them as “idle tales.” I have had queens from all over the United States, and even from Australia, which would do nothing but go to booming brood-rearing at just the time they should be bending every energy to the storing of nectar, if I was to reap any reward for my trouble in keeping them. That queen from Australia would put brood in only four combs prior to our

basswood-honey harvest, and I had a mind to kill her on account of her unprolificness, but did not, because I wanted to show people a queen raised in a country on the opposite end of the globe, and 10,000 miles away. Imagine my surprise, when the basswood harvest came on, when all of the queens from my stock were beginning to retrench brood-rearing, to see this queen go to brood-rearing as if it were the fore part of May, and thus continue till nearly every available cell in the brood-chamber was crammed with brood; and at the close of the honey harvest they began to swarm, and kept it up as long as there was a drop of honey to be had in the hive or elsewhere, fully a month after the last swarm from my own queens had issued. I kept putting in frames of honey to keep them from starving, and they kept swarming till they not only used up all the honey they had gathered, but fully 20 lbs. from other colonies, and I had to give them their stores from other colonies for wintering. I thought I would try them again the next year, was the reason I wintered them, but the next year they proved just as bad, and so I killed the queen and gave them one from my own stock. And this is the way, only to a lesser extent, that the Carniolan and Syrian queens have acted with me, as well as several queens of the Italian race which I have procured from other parties.

We have talked during the past about the prolificness of queens as being the great object which should be sought after; but I came to the conclusion long ago that prolificness in a queen, which could not be controlled, counted for naught—yea, worse than naught.

If this criticism of Bro. Eastwood, which called out this article, shall set us to thinking along the right line regarding the prolificness of our queens, he will have done the world a great favor, and I shall not have written this in vain.

Borodino, N. Y.

RAMBLER'S JOUNCER.

Extracting Combs without Taking them out of the Super.

BY J. HAMMOND.

Mr. Root:—In reading GLEANINGS for Jan. 1, I noticed Rambler was trying to kill off my new bee-brush with his jouncer. Of course, a fellow doesn't like to see one of his pets knocked out with such an ugly-looking "jouncimal" with forty legs, more or less; and, just see his position in the performance. Surely he must be out of joint entirely; and since when, and where, has he accumulated such enormous wealth that he offers to squander it by offering such large prizes for such simple little queries as how to extract one whole super without removing the frames? Now, I want that fifty dollars, so will you tell him to send it to me right away? I need money. I

have made only very little since my accident two years ago this spring. Here is the method he covets so much: First, provide a reversible extractor suitable to accommodate four supers at one time. Place the supers in and then uncup. He will have to use tin separators in place of fences to stop the honey from being thrown on to the next section, and work speed accordingly. If he can not see a way to uncup the four supers while setting in the extractor, tell him to jounce his head a very little, and then brush it well with one of my bee-brushes, and, perhaps, while doing so he will see so much wire it will inspire him with an idea.

But, by the way, I am giving him too much and too good measure for the price. I am giving four where one is the bargain. Well, tell Jouncer he can have the first one for the price offered, and I will throw in the other three for fifty dollars more; and if he offers enough of a prize I will give him a method on an entirely different principle that will almost jounce the wind out of him. I am not a good hand at keeping secrets, so I will give it to you to keep for me; and if Rambler will promise not to let his great big jumping, jarring, splashing, jouncing jouncimal molest my little pet any more, and you can jounce some of his spare wealth out of his pockets, we will let him peep in through the glass in the tank while the method is in operation. Here is the method: Provide a strong tank with a lid to open and shut with a rubber joint, to make it air-tight. Insert suitable valves where needed, also connect a powerful air-pump. Place inside, inverted, 100 supers, more or less, and just pump the honey out by suction through the cappings without removing; then if you can jounce 40 or 50 millions out of Rambler we will share the swag.

Buena Vista, O., Jan. 22.

[I hardly know whether to take you seriously or as joking when you speak about extracting the combs without taking them out of the super. However that may be, I once entertained the idea that it could be done very feasibly; but if you will stop and think a minute you will see at once why tin separators between the combs would not be practicable. The first difficulty is in the matter of uncapping the combs. The next is in getting the honey out. We will put our supers, having tin separators between each pair of combs, into a mammoth honey-extractor. We will turn the reel vigorously. The honey will now fly out, and strike the tins. Except for uncapping this is all very simple. After the honey is all out of one side of the combs in the supers we will turn the supers the other side to. Remember that one side of the tin separators will be covered over with honey perhaps an eighth of an inch thick that has not yet run down. We will turn the extractor and get it under good motion. Now, don't you see that the honey that clings to the surface of the tins will *fly back*

into the cells from which it came? Ay, there's the rub.

It is true that Coggs shall has tin separators between his pairs of combs; but his extractors, you will bear in mind, are not reversible, and the surface of the tins is not reversed.

I myself never saw the difficulty in the way until Mr. J. F. McIntyre, of California, pointed it out to me.—Ed.]

TWO VS. FOUR FRAME HONEY-EXTRACTORS ;
EXTRACTING IN A WHOLESALE WAY;
CRITICISMS.

We have noticed a great many remarks in regard to the relative merits of the different sizes of honey-extractors, and among them Rambler's suggestion in Ramble 193, that some one should make a test. This prompts us to report our experiences with them.

We have eight different apiaries, and keep an extractor at each place. This gives us a chance to test the machines under the same conditions, and with the same men, and here are the results:

The two-frame Cowan is all right for light work (what we mean by this is where you have time to use care in handling). It is the easiest to move and to run, and is suitable for up to 150 colonies of bees. It is not strong enough to stand forcing, such as is necessary where a gang of four men are working in the apiary, as in our case. We have never been able to force one for a day without having trouble in keeping set-screws tight; and, in fact, many little things go wrong. The most that we have extracted with this size in one day was 26 cases, July 25th.

The four-frame is our choice, every thing considered—the cost, room required to manipulate, and strength required to run it. Its capacity is about equal to the amount of heavy combs that an experienced uncapper can turn off, and it will keep two men busy bringing the honey in. We find that we can average about two tons a day with it under favorable conditions.

But when it comes to doing a really wholesale job, give us a six-frame. A good strong man can do just twice as much with it as he can with the two-frame, and do it with less hustling. It is easier on the combs, and does cleaner work than either of the others, and ordinarily the operator does not have to pay any attention to paring up the combs (that is, keeping the heavy combs opposite so that they will balance). It is a splendid machine, and will handle all the combs that you can bring to it, as two men can work to advantage on it in case of a rush.

Now for a little honest criticism. The manufacturer evidently does not realize to what an extent we have to crowd our extractors in the large apiaries of Southern California. While the extractors are undoubtedly very near perfection for a little gentler use, we find the monkey-wrench, a few rivets, and set-screws (to say nothing of brake-bands and a soldering-outfit) are necessary to keep even the newest, largest, and strongest in shape for good work. In the first place, the handle will not stay on the shaft. Why is only one set-screw used there, and two everywhere else? We have overcome that difficulty by the use of a key carefully fitted and driven home to stay. But even now the set-screws work loose every little while, allowing one gear or the other to slip, and even the basket to start out on an independent revolution. The brakes are a great help, but do not stand up to the work. Ours all gave out this season one or more times. The band breaks where the screw holds it on the lever. The continual bending is too much for it. These little things can easily be made secure without any perceptible cost to the maker, and we believe that it will help to make better bee-men, not to say Christians.

EMERSON BROS.

Santa Ana, Cal., Nov. 15.

[From my own personal experience (and you know I have helped to extract in California with two, four, and six frame machines), I believe you are pretty nearly right; and I know you are right in regard to the use of the set-screws. The Root Co. will undoubtedly make a change.—Ed.]

FULL FIVE-BANDED ITALIANS.

Mr. Root:—I was very much surprised at your remarks in Dec. 1st GLEANINGS in regard to golden Italian queens. I was also glad to note that a friend, Mr. H. H. Hyde, has replied to that statement, and at the same time I am sorry to note that you are still unconvinced that there are straight five-banded Italian queens, or, in other words, golden queens producing straight five-banded workers. I wish to add my word to that of Mr. Hyde, for I have not only seen a large number of such queens, but have owned them, and last season sent out about 25 straight golden queens—those whose bees showed five yellow bands. Neither myself nor Mr. Hyde now have queens for sale, and this is not said with the hope of any pecuniary reward.

I also notice that you made a short tour of Texas last summer, and have run these travels through GLEANINGS, and have now got to Arizona in your travels, and you have not said a word about the great Texas product, *bulk* comb honey. I should like to see it properly shown up in GLEANINGS, also to have your opinion on it after going through the very heart of the country where it is produced, and talking to some of its main producers. I hope you will again

some day make Texas a more extended visit, so you can satisfy yourself as to these statements above. WM. CRAVENS.

Floresville, Texas, Jan. 28.

[Do not misunderstand me as believing that there is no colony of bees *all* with five bands. As I said before, I say now, I never saw *all* the bees of any one queen that showed the five yellow bands. I have seen the progeny of some queens that showed four bands and five bands.—Ed.]

Prove all things; hold fast that which is good.—I. THESS. 5:21.

I have been greatly troubled of late years—in fact, dear friends, I have been troubled more or less during all this short life of mine—not only because truth and error lie scattered before us everywhere, but because of the difficulty of separating truth from falsehood. Even when I was a child I was in the habit of asking questions innumerable about these strange and wonderful things that are being constantly unfolded before every one who loves to study nature and humanity. I am told that, after my father and mother said things were thus and so, I would follow my question right up by saying, “How does anybody know this? How can they be sure they have not made a mistake?”

Now, do not imagine I have all my life been doubting *every* thing. When reasonable proof has been furnished, I believe I have been willing to accept facts. At the same time, I always had a fondness for testing and proving the thing myself. I once heard of a boy who, when he was told a pound of lead and a pound of feathers weigh exactly the same, could not be satisfied until he got his mother’s steelyards and proved the thing to his own satisfaction. When I was old enough to get acquainted with the doctors (and, by the way, that happened at a very early age in my case) I was very curious to know how *they* found out that certain medicines would cure certain diseases. After I had admitted that this might be true, I was still more perplexed when told that certain things could not be cured unless one took a certain combination of things—a little of this or of that; a pinch of something else, and so on until you had a bottleful of a great many things. Somebody would tell me they had discovered by careful experiment that all these things were good, and that by combining them they got a “powerful” panacea for certain troubles. Well, after I had reluctantly admitted this might be true, the question then arose, “How is it possible for anybody during his lifetime to find out that a little pinch of this, a tablespoonful of

that, a teacupful of the other, and so on through (just so much of each, and *no more*), is exactly *the* thing to cure so and so?”

Our humble home furnished on its shelf several books, one of which was called a “doctor book.” I read that book through and through, and proved a good many of its statements, and also proved the absurd folly—at least I thought I did—of some statements. Now, do not think I am going to make a tirade against doctors. Our family physicians are to-day benefactors to humanity; and even in olden time they *meant* to be benefactors. I say this, even if it is true, as has been stated, that, through mistaken kindness, they took the life of the father of our country by drawing his blood away from him just at a time when he not only needed every drop he had but a good deal more if it could have been furnished.

As I became older, when multitudes of people assured me a thing was true because they had each and all been benefited, I decided that “many witnesses” ought to settle the matter. One day at school, however, when the whooping-cough was raging I was told that a certain woman in the neighborhood could cure it, and the children all flocked to her door, when school was out, to get cured. When I inquired into it, I found she gave some of them a raisin, others a piece of dried apple, still others a bit of bread. In fact, the medicine was different every time. This was a real stunner. Then I was gravely informed that whatever *she*, this particular woman, gave a child, it cured him of the whooping-cough, because this woman, when she got married, did not change her name! Her husband’s name was exactly the same as her own; “and,” my informant said, “*everybody* knows that a woman like that, when one can be found, can *always* cure the whooping-cough. Just you eat what she gives you, and you will not cough any more. Try it and see.”

Well, I “bolted” at this sort of *science*(?) for I remember I decided, like Galileo, that, even if the whole world declares to the contrary, and gives any amount of testimony, I would never consent to swallow such philosophy (!).

Now, dear friends, the thing that troubles me, as God lets me look forth into this world of ours, is that there are multitudes of cures that have no more sense or science about them than this cure for whooping-cough. And yet people insist that they have tried it, and it is true, and they keep on spending their hard earnings. I have said so much about Electropoise and Oxydonor I hardly need bring it in right here; but after a prolonged “fight,” extending through several years, the world has mostly admitted I was right about these senseless toys. I am not sure, however, that some one will not write to me now in all seriousness, and tell what wonderful cures Oxydonor has performed in their own family.

You know how I have been fighting, not only superstition but deliberate impostors, in regard to foretelling the weather. Yes, I have been "snowed under" several times; and, worst of all, by (apparently) educated and intelligent people, who insist, in spite of all I can say, that we have men living who can tell a year ahead what the weather is going to be on a certain day. When the Weather Bureau took this matter up I turned to that for relief, thinking our government would certainly be able to find men who could sift truth from falsehood, or science from folly and superstition, and, thank God, I have not been disappointed. It is true, the papers (some of them) say, "The Weather Bureau predicts an unusually cold winter," or something to that effect. Every time I get hold of such clippings I forward them to the Department, and each time comes the public announcement, very emphatically, that the Weather Bureau has never yet even hazarded a *conjecture* as to what a certain summer or winter is likely to be. If you see any such piece of folly in your home paper, or in any other, call the editor down. Tell him he is not up to the times.

Well, when I heard about the bombardment of thunder-clouds with artillery, I fell to wondering whether humanity had any artillery equal to such a task; and my faith in and admiration for Chief Willis L. Moore, of the Weather Bureau, were greatly increased by noticing that the head of the Department stood squarely against such a waste of money. As this whole matter illustrates the difference between sense and science, and as it shows, too, not only how crowds of people or even a great nation may be misled into spending vast sums of money, I have thought best to copy at considerable length from the author's report to the Department of Agriculture for the year ending June, 1901.

DESTRUCTION OF HAILSTORMS WITH CANNON, ETC.

Considerable interest has been aroused among agriculturists in the United States relative to the prevention of hailstorms by the use of explosives fired from specially designed cannon. The experiments conducted along this line by grape-growers of France and Italy have aroused popular interest in this country. The theory is not a new one, though perhaps not so ancient as the idea that precipitation occurs soon after and as a result of the explosives used in battles. As early as 1769 the Marquis de Chevières, a retired naval officer of France, thought that he could combat the scourge of hailstorms by the firing of cannon; but his experiments, like those conducted by many others at various times during the past century, were not productive of definite results.

One of the most serious drawbacks to grape culture in Europe is the destruction caused by hail, and the growers are naturally interested in any thing that promises to give immunity from such damage. During the past two or three years renewed interest has been taken in the matter by the vinedrivers of certain parts of France and Italy. Several manufacturers have placed upon the market a special form of cannon which they claim will effectively break up hail-bearing clouds. The belief in the efficacy of this method of protection has become quite general in Europe, although scientists versed in the physics of the air have not expressed confidence in the system.

In brief the apparatus in use consists of a cannon fitted with a funnel-shaped conical extension. The difference between the various forms of cannon that are used lies mainly in the shape and size of the funnel extensions and the size of the powder charges.

Usually the cannon are fired vertically upward, although in some instances the apparatus is inclined toward an advancing cloud. The effect of the funnel attachment is to cause the formation of a mass of rapidly revolving air, or vortex, which leaves the mouth of the cannon with tremendous velocity. In shape, these vortices can be likened somewhat to the rings or puffs of smoke made by a person smoking a cigar. It is claimed that these whirling masses of air, intermixed with gases from the explosives, are forced upward to a sufficient height to enter the hail cloud and destroy its hail forming processes. If it is granted that these rings ascend to a sufficient height to enter the cloud, I am of the opinion that the force of the ring is too puny to have any appreciable effect on the cloud.

Many experiments have been made for the purpose of ascertaining the actual height to which these air rings rise before being dissipated. In a report by Profs. J. M. Pernter and W. Trabert, who, at the invitation of the Imperial Department of Agriculture of Austria and of the inventor of one of the methods, made as complete an investigation as was possible, and, under various conditions, these scientists stated that they were not able to report any thing positive as to the value of hail-shooting. They reported that, using the largest cannon and the heaviest charges, the vortices did not ascend to a height of 1000 feet on an average, although in some instances greater distances were obtained.

There is a marked difference of opinion as to the effectiveness of cannon-firing, with the manufacturers and many grape-growers on the one side and the scientists of America and Europe on the other. The former maintain that hailstorms can be prevented in the manner described, while the latter claim that the force exerted by the explosives is infinitesimal as compared to the forces of nature that are exerted in hail formation, and that experiments conducted by the adherents of the cannoning process themselves have not produced convincing results. The number of thunderstorms from which hail is precipitated is but a small percentage of the actual number. In most localities of the United States a whole season sometimes passes without a fall of hail, while in seasons of abnormal thunderstorm frequency the number of hailstorms is small. While in the grape-growing regions of France and Italy there may be greater hailstorm frequency, it is still true that the number of hailstorms is few as compared to the number of thunderstorms without hail. The experimenters score a success whenever they shoot at a thunderstorm cloud that does not produce hail, although the chances are greatly in favor of there being no hail in the cloud. Again, they excuse the occurrences of hail in spite of a bombardment by saying that the cannon was not large enough or the powder charge sufficiently heavy, and declare that the hailstorm was far less severe than it would otherwise have been. How is one either to prove or disprove such statements?

It is true that many important discoveries have been made by experiments that were conducted contrary to scientific theories, and in the matter under discussion it is not our intention to overweigh the scientist or to underestimate the practical investigator, but unquestioned facts and not explanations must be the proof of results. Scientists both in America and in Europe declare that hailstorms can not be prevented by the use of cannon and explosives of even greater power than have been used or that it is possible for man to use, and they base their belief on such knowledge of the forces of nature as science has revealed. Those opposed attempt to break down the scientists' argument by declaring that no one has yet satisfactorily explained the processes of hail formation. This is true to a certain extent, but enough is known upon which to base a logical opinion.

But there are other reasons for believing that the use of cannon and explosives in preventing hailstorms is not effective. Mr. Stiger, one of the inventors of the apparatus in use, claims that hail is formed in quiet spots in the atmosphere, where atmospheric moisture crystallizes out in large crystals in a manner analogous to the formation of large crystals of salt in liquid solution. I agree with Professor Abbe that there are no such quiet spots in the atmosphere, and hailstones are not crystals, but masses of ice with only a partially crystalline structure. Even the perfect crystals of the snowflake are formed in the midst of rapidly moving air. Hailstorms are generally local and very erratic. Some have maintained that they are controlled by the hills or the contour of the ground or by the presence of forests and lakes, and this may be true to a certain degree; but, practically, the whole question is one of ascending and descending currents that characterize whirlwinds and thunderstorms.

Several thousand shooting-stations have been established in Italy and France during the past two years, but reports received from them give no definite data in support of the success of the experiments, although there is no doubt that the cannonading is believed to be effectual by the farmers who do the work. Waves of irrational enthusiasm sometimes sweep over a community, only to be regretted in subsequent years when calmer judgment has come to prevail. We have but to remember the experience of our own country only a few years ago with the rain makers, and how firm was the belief of thousands of people in the sub-arid and arid regions of the West that the use of powerful explosives would produce rainfall.

Thousands of dollars were expended in these experiments before the absurdity of the claim was demonstrated. It is a fact worthy of remark, that the hail-shooters are now using practically the same methods to dissipate the clouds that the rain-makers used to produce them. Time and experiment will probably demonstrate that hail prevention by such means is as impracticable as rain production. The fact that 15,000 or 20,000 shooting-stations have been established is of itself no argument as to the efficiency of the process. One might as well argue that the moon really affects the weather because a million people believe it and can prove it—to their own satisfaction.

A knowledge of the exact truth on any question of natural science is not easily attained. The hail-cannonaders base their reports of success upon such statements as "a black cloud was seen approaching, cannon were fired, and the cloud passed over without hail," or "it passed to one side and the hail did not fall on the protected vineyard, and there the hail ceased," or "the cloud broke in two, passing to the right and left, leaving the sky cloudless over the cannon." Now, these are quite common cloud and storm phenomena, and they will frequently happen without cannonading. There is no way of telling by the sight of an approaching cloud whether or not it is accompanied by hail. Therefore, if the cannon be used every thunderstorm would have to be bombarded, although statistics have demonstrated that only one thunder-cloud out of a great number contains hail. In other words, there would be a tremendous waste of time, money, and energy in unnecessary bombardments.

After examining all that has been published during the past two years on the subject of hail prevention, I have to repeat the opinion heretofore expressed that we have here to deal with a popular delusion, and that efforts should be made to prevent its spread in this country. The great processes going on in the atmosphere are conducted on too large a scale for any man or any nation to attempt to control them. According to Prof. Abbe, the energy expended by nature in the production of a hailstorm, a tornado, or a rainstorm probably exceeds the combined energy of all the steam-engines and explosives in the world. It is useless for man to attempt to combat nature on this scale.

Now, friends, I hope you have not only read the above carefully and thoughtfully, but I think it will profit you to read it several times. Most of you know more or less of the experiments in regard to "rain-making." A little periodical for children, and one that I have a great admiration for, lately announced, while illustrating something else, that the experiments made by the general government of the United States in regard to producing rain, by the use of explosives carried up by means of a balloon, were a perfect success. I was going to forward the extract to Mr. Moore, but I afterward ran on to a contradiction of the statement by Mr. Moore himself. No success of any kind—at least nothing that would bear the searchlight of science—has ever been accomplished in rain-making. Certain enthusiastic inventors, who had a pecuniary interest in the matter, claimed success, or did claim it at the time the experiments were made. As it is now several years since the matter has received any attention, we may safely conclude, I think,

that our Weather Bureau is sound and level-headed.

In concluding this subject I wish to make an extract from an article in the February number of *Good Health*, entitled, "The Curse of the Drug Habit."

Various enterprising patent-medicine firms, by persistent and extravagant advertising, and partially by taking advantage of that superstitious reverence which still lurks in the public mind for drugs that are put up under mysterious names, succeed annually in disposing of \$20,000,000 worth of their nostrums. The average invalid demands something more substantial than extravagant claims. As there is no drug that will so effectually smother the immediate cries of an outraged nerve as some form of opium, and as there is no medicinal agent that can supply such satisfactory temporary exhilaration as cocaine, therefore these drugs are beginning to enter largely into the composition of these so called "remedies." They assist the enterprising manufacturers in securing reliable and convincing testimonials as to the remarkable efficacy possessed by their particular "cure" in furnishing immediate relief from pain. Soon a large number of these invalids discover that they can purchase the active agents for themselves cheaper than the patent medicine man can supply them, mingled as they are with a variety of more or less inert substances. Unfortunately, many drug fiends made their first acquaintance with these drugs under the physician's supervision; but after they passed from his observation they did not dispense with the fascinating effects of the drugs he prescribed.

FLORA HOME—A CAUTION TO MINISTERS, AND LAYMEN TOO.

Your write-up in regard to Flora Home was a good and true one, but it did not suit the sharks. Had I known that you were there I would have gone after you, and you would not have got drunk on tobacco at my place. I lived one mile west of there. Mr. Wilson, of the F. F. & F., of Chicago, was the man who got those people down there, and he was a man who would expose frauds and talk religion and temperance just as you do, and would preach when there on Sunday, and do all he could to get people to stay when they were there, to get others to come.

Orange Heights, Fla.

[S. R. BOYD.]

I have given the above because I wish to urge more caution not only to ministers but to professors of religion in general. Speculators have learned by experience that, if they can get a minister of the gospel, a religious paper, or even a man who can talk and pray in prayer-meeting, to boom a town or an oil speculation or a gold-mine, they can draw in lots more people. I have sometimes remonstrated with ministers and others for lending their names to such schemes, and they often reply, "Why, it is a good thing," meaning by this that they had faith it was a good thing. But, even if this is true, ministers especially should let such things alone. There are grievous losses and failures all the time. We should all be careful about urging anybody to put his small hoard of earnings into any thing; and especially should we be careful about urging people to move away off into some new locality like Flora Home. If those who have pushed projects of this kind could visit Flora Home, and talk with some of the people who have been duped into investing their all, they would, I am sure, be more careful. Notwithstanding what I have said, I believe there are people who would make a good thing of Flora Home in some special line that the locality is adapted to,

just as Mr. Hale, the peach-man, is making a success of peach-orchards by the square mile down in Georgia. But where there is one like Mr. Hale there are thousands who had better keep in the beaten track. I know the above hits me a little, and I thank friend B. for his timely and wholesome rebuke. It will help me to be careful about what I recommend—especially anything along the line of real estate or other sorts of speculation gotten up on purpose to draw in the unsuspecting.

MRS. HARRISON TELLS US HOW TO MAKE A
HOE-CAKE, AND SOMETHING ABOUT
FLORIDA.

Mr. Editor:—I've exceedingly enjoyed reading your account of how you made that outing-place in Michigan. I would shut my eyes and watch you digging out the spring, and listen to the rippling water as it went purling away.

What a sweet piney smell in that new cottage! How I should have loved to sit around that improvised table, and share the fresh fish and potatoes—much more than at the home in Medina! There was one thing you lacked, and that was a hoe-cake, baked as the native Floridians bake it, with slight variations. Take two small cupfuls of corn meal, one teaspoonful of salt, the same of sugar, and pour on to it boiling water until it is thick enough to spread on a griddle nicely, and then set it over a slow fire. When it is baked on the bottom turn it over, or, better still, put it into a hot oven until it browns nicely. When fish is eaten with this kind of bread the stomach has such a restful feeling, and you are not troubled with thirst as when it is eaten with fine flour bread. This is the true bread of the South; and we often meet Southerners who have been north and starved because they could not get their bread. With many kinds of food they don't want corn bread made with eggs and sour milk, which they call egg bread.

Mr. Root, why didn't you make a winter home in Florida? You could have found some sheltered sunny nook, and taught us how to raise crops all winter. On my veranda I keep boxes of rich soil, supported by tin milk-cans, to keep the floor from decay. The first day of my return I empty the soil from the boxes and shovel it back again; then plant onion-sets, radish, and lettuce seed; sprinkle with warm water, and cover up at night, if chilly. In a few days the plants are up, and in a short time we are pulling out the crisp tender onions to make room for the lettuce. During the zero freeze we did not lose our lettuce. The ground froze, but we thawed it out with water from the well, and it was not injured. We also make garden in the open ground, but we can protect our box garden easier during frosty weather. Every thing grown in Florida soil is very sweet. Her turnips and beets can not be surpassed anywhere.

Any person who has to seek a warmer clime every winter had better purchase a little home. Plenty of them can be had cheap, and a person be more comfortable than traveling around. I once asked a lady living in a fine house, elegantly furnished, if she did not like to leave it and live in her board cottage of one room in Florida, and not have to sweep, dust, and clean? She replied, "Indeed I do. And I'm just as happy, and more comfortable."

I've one orange on one of my trees, but it's a big one; and, Mr. Root, if you come we will sit before the open fire and eat it, and talk bees. If you remain over night you can sleep on a bed made of saw palmetto leaves, and breakfast on fish and oysters from the finest bay on the continent, with a hot hoe-cake, of Mrs. Harrison's own make.

Peoria, Ill.

MRS. L. HARRISON.

Dear Mrs. H., nothing would give us more pleasure than to have you sit down with us at our meal in our cabin in the woods; and if I ever get down your way again I shall most surely hunt you up, and I shall be sure of just such a warm welcome as you promise. We may some time try a cabin in the woods in Florida.

Tobacco.

TOBACCO AND OUR SCHOOLS.

In years past I have spoken some very kind words in regard to our Ohio State University at Columbus. I have spoken with pride of their buildings; I have spoken of their apparatus, their machinery, and their methods. But I am now going to complain of just one thing—perhaps I might say of just one *person*. They have a professor there, one who, I understand, is "away up," and who smokes a pipe while he gives his pupils advice and instruction. I do not know that he does this as a general thing, right along; but I know that he did talk to one young man, advising him as to how much and how little Latin he should take, besides other matters, and he was obliged to take his pipe out of his mouth when he spoke. This young man was not a pupil; but he visited the State University with the view of becoming one. I am not sure that the pipe was the means of deciding him to go elsewhere, but he *did* go elsewhere. I talked with several others of our educators in the service of the State, and they admitted that such was his custom, and deplored with me the influence that this example was likely to have on our Ohio boys. Now for the fruit of keeping a professor of this sort.

A few days ago a young man who has been for some years finishing his education at the Ohio State University received an application for a recommend, and this is the one I gave him, addressed to a well-known professor at Ithaca, N. Y., where my young friend expected to get a situation:

Prof. L. H. Bailey Ithaca, N. Y.

DEAR SIR:—It affords me great pleasure to say that I have known the bearer from boyhood up, and that he has all his life been a model of steadiness and uprightness. I believe him to be a young man who will make his mark in the world, especially if diligence and close attention and most excellent habits will contribute to that end. Any thing that you can do for him will not only be gratifying to me and his host of friends here in Medina, but I think it will prove an advantage to yourself and any others with whom he may have to do. Your old friend, A. I. Root.

After I wrote the above recommend it troubled me a little because I had not known personally very much about this young man since he left his home on the farm near Medina; and several days afterward I was not only astonished but almost appalled on being told that this model young man—one who, from what I knew of his Christian parentage and early habits—one whom I felt almost as sure of as of my own boys—was not only using tobacco, but that he *defended its use*, and, in spite of every thing his friends could say, he declared his intention to stick to it! I at once wrote him what I had heard, and said that, if it were really true, I must ask to withdraw my recommend, and that, if it had already been sent on to Ithaca, I could not see any honest, straightforward way out of the dilemma but to send this second letter,

to be presented *with* the recommend. Below is the reply I received. Of course, I suppress all names.

Mr. A. I. Root: Your letters of Feb. 25 and March 6 are at hand and contents noted. I was very grateful for the kind recommendation, and am sorry that you felt the necessity of recalling it. For the time being I did not think of your strong prejudice in the matter, and so hope you will pardon my seeming deception.

It is evident that your ideas and those of some of my relatives do not agree with my own regarding the use of tobacco. However, it is of no use to argue those things, for we all have a right to our own opinions.

I have some few grains of honesty left, so I do not promise to quit smoking, and send the recommendation along. While I am not and do not intend to be an excessive smoker, yet I do not feel justified in promising away my personal liberty in the matter to secure a recommendation on false pretenses, as it were; so I take the only honorable alternative left me and return your letter.

Hoping you will not consider me eternally lost, I am

Sincerely yours,

Ohio State Univ., Columbus, Ohio, March 7.

You will notice from the above that my young friend admits he knew how I have battled against the use of tobacco all my life. You will notice, also, he has got hold of this taking phrase, "personal liberty." I wonder if that professor with a pipe in his mouth used the expression in talking with his pupils. And, by the way, one of the best illustrations of personal liberty I ever came across was something like this:

I was pleading with a man who, in a drunken fit, had turned his wife and children out of doors in winter. I asked him to sign the pledge, but he refused. One or two others who were present and heard the talk signed the pledge. One of these afterward broke it. My friend, in speaking of it to me, said, "Now, Mr. Root, in view of this don't you think it was better that I did not sign the pledge, when you urged me so hard?"

You will notice there is considerable logic—that is, of a certain sort—in that man's reasoning. Our old pastor, Mr. C. J. Ryder, now of the American Missionary Association, Boston, Mass., placed the matter in its true light as follows:

"Mr. H., you mean by that, after you had refused to sign the pledge you could *get drunk with a clear conscience*; whereas, had you signed the pledge this would not have been your privilege."

Now just a word in regard to the college professor (or, if you choose, one of the leading professors of the Ohio State University) smoking a pipe in the presence of his pupils. What do the people of Ohio—yes, or the people of any other State—think of the matter? School-teachers, as a rule, do not use tobacco; in fact, they can not consistently use it while they urge on their pupils the importance of the principles taught in our standard text-books in regard to the future health and best development of the human body. I should like to have our people consider this matter, both men and women. Is there anybody who prefers to have a boy under the tuition of a professor who has to remove his pipe from his mouth before he can talk to his pupils?

Just one thing more: Our young friend says he does not *intend* to be an "excessive

smoker." That sounds honest and sincere; but at the same time it sounds boyish, and, in fact, he is hardly old enough yet to realize the danger he is innocently, yet surely, deliberately walking into. May God help him.

Right here is another thing about tobacco and education that confronts us. Some time ago our Ohio Experiment Station at Wooster was asked to make some experiments in regard to the best varieties of tobacco and methods of culture, etc. But the men at the head of our station have the welfare of our people so much at heart, especially our boys', that (if I have made no mistake) they asked to be excused from entering into the work. Of course, there was a "racket" about it. Just a few days ago a young man who has been through a two years' course of instruction at the Wooster Station visited us to look over our plant. He is in the employ of the State of Texas, and wishes to introduce bee culture on their State Experiment Farm. I asked him in regard to the matter I have mentioned at Wooster. Then I found out that he himself was a tobacco-user. He said: "Mr. Root, it seems a little hard for the farmers along down the Ohio River, who make their money on tobacco, to be told that the people at the experiment station refuse to assist them in their industry."

Now, I do not remember my reply, but I think I crowded him a little on the moral standpoint of the matter. He replied, as nearly as I can remember, as follows:

"Why, Mr. Root, it *is* true, without question, that the tobacco industry has nothing to recommend it except the *money* that there is in it."

I replied, "But there is *money* in starting more breweries and distilleries."

His answer was that he did not think the two were exactly parallel. As the subject seemed to be getting a little painful, we dropped it and talked about introducing bee culture in Texas.

Now, once more I wish to submit this question to the people of Ohio—yes, and of the whole United States. Our boys are being educated, and their habits and their tender minds are being formed. Their bias for life is being fixed, not only at our Ohio State University, but at our Wooster Experiment Station. These institutions are both conducted by men who are servants of the people of Ohio. What do we want them to do about it? And this is a question on which the *wives* and *mothers* have a right to express their opinion. Is it not so?

J. B., Va.—To keep mice out of hives, providing the entrances are deep, use a coarse-mesh wire cloth, coarse enough to admit bees through it, but fine enough to bar out the mice. This will give the bees plenty of ventilation in the cellar, and at the same time prevent the rodents from annoying them.

PARIS GREEN—HAS ANY THING BEEN DISCOVERED OR INVENTED THAT IS BETTER AS A FUNGICIDE?

The Department of Agriculture, in Farmers' Bulletin No. 146, discusses the matter of insecticides and fungicides. They have made a series of exhaustive experiments, and it has turned out just as I expected it would. All these new things that are advertised and puffed depend on Paris green or some other preparation of arsenic. Not one of them will do the work as cheaply as Paris green; and a good many of them, while costing ever so much more, are not nearly as efficient. A great number of them that claim to fertilize the soil while they kill the bugs have no fertility about them whatever. These experiments have been made with "green arsenoid," "para-green," London purple, "lead arsenate," "pink arsenoid," "white arsenoid," "bug death," "slug shot," "Smith's vermin exterminator," "veltha," "fibro-ferro feeder," etc. Of all these mentioned, London purple comes nearest to Paris green in furnishing value received. Slug shot is mainly crude gypsum. It gives satisfaction because the gypsum is ground and mixed accurately by machinery. But the Department decides, as I decided years ago, that it is an extravagant way of purchasing the Paris green you need to kill the bugs. Lots of these things are sold and used just because of being so extensively advertised. This bulletin is prepared under the direction of United States Chemist Wiley, and is authority on the subject. I am exceedingly glad that Prof. Wiley has taken this matter in hand, and made some experiments, at the expense of the general government, that can be depended on.

GRAND RAPIDS LETTUCE SEED—A GILT-EDGED STRAIN.

Mr. Root:—I have ordered a sample of your California Grand Rapids lettuce seed, to compare with my greenhouse-grown. I told you last year that I had pulled 600 feet of lettuce without a single cull or sport, but did not ever expect to do it again; but I am glad to say I have had 10,000 feet this winter, with only three sports in the whole of it. I am surprised how three years' care in growing seed has brought it so near perfection—that is, if the feature is a permanent thing, which it is too soon yet to be sure of.

Waterloo, P. Q., Feb. 13.

THOS. SLACK.

Friend Slack, I rather think your improvement in seed is a permanent thing, or pretty nearly so. It agrees with my experience. The Grand Rapids lettuce is not only the easiest and prettiest plant to grow under glass, but it seems to be wonderfully docile, if I may use the expression, when you give it to understand what is wanted. Prof. W. J. Green, of our experiment station, has just been through our greenhouse, and he says they have succeeded in getting

a beautiful strain of the Grand Rapids lettuce, starting with seed furnished by you. No doubt your strain is much ahead of our California grown; but in our greenhouse we hardly find one bad plant in a thousand from our own seed. In contrast with this I may mention that I sent to a firm that advertises lettuce and other vegetable-plants all the year round, in many periodicals. As they do so large a business I supposed they would, of course, have the best strains. They offered plants by mail at 15 cts. per 100. I sent for samples, particularly to see if they sold transplanted plants at that low price. Well, they were not transplanted, and the whole hundred is now ready to cut. At least a quarter of them are sports of all shapes and shades. Some of the plants are enormously rank and luxuriant, but they are not up to our Grand Rapids. Now, when good seed can be bought at the low price of 40 cts. per lb. it does seem to be too bad to grow plants for sale of this sort. I shall be glad to receive your report in regard to the California-grown seed.

COLOSSAL LADINO, OR MAMMOTH WHITE CLOVER.

Our friends will find something in regard to this on pages 135 and 137. Since then Dr. Miller has sent the following:

Thanks to the unwearied efforts of my good friend Mr. Ed. Bertrand, editor of *Revue Internationale*, I have finally received a sample of seed of the new giant white clover, *Trifolium repens giganteum*, var. *Colossal Ladino*. Now let's give it a fair chance at Medina and Marengo. I would send M. Bertrand's letter, but as it is short it will be more convenient if I send a translation. He says: "I inform you that I have at last found seed of the white clover, *Colossal Ladino*; that is to say, that the person whom I had charged to continue the search has discovered a house at Lyons which sells it. This new variety was obtained in Lombardy. It is, in Italian, *Trifoglio Ladino bianco vero lodigiano*, or *Trifolium repens giganteum*, var. *Colossal Ladino*. I send the sample received. Let me know if you want any quantity. The price is 10 francs per kilogram, or 85 francs for 10 kilo." That makes the price in English \$1.14 a pound; 22 pounds for \$17.00. Please let me know at once what to say to him about wanting any, or else write direct to M. Ed. Bertrand, Geneva, 4, rue du Mont de Sion, Suisse (Switzerland).

Marengo, Ill., March 14.

C. C. MILLER.

I at once took the small packet of seed and sowed it in the greenhouse in our regular seed-pans for choice and valuable flower seeds. In four days the clover was coming up, which speaks well for its vigor and vitality. I am going to have these little clover-plants potted, and "push" them, as I have been telling you about, in that little greenhouse. These plants, with the early start they have (the seed was sown about the middle of February), will, I expect, blossom and furnish seed this year. Any one who can not make a clover-plant grow in his garden must be a bungler indeed. The greatest trouble we have in our greenhouse is to "yank it out" when it threatens to outstrip and smother other plants. We have not thought best to send for the seed, for there would not be time to get it this year so as to produce blossoms

anyhow—at least I suppose not; and with our stock of thrifty young plants we can give the plant a good test and decide whether we want the seed another year or not.

GINSENG GROWING.

We grew a small bed of ginseng through 1901, and are so well satisfied there is money in it that last fall we bought 50 pounds of green wild root, dug in this vicinity, for \$190, about 4000 roots in all, of all sizes from seedlings to 402 roots. They are set in three 5x200-foot beds, 8x10 inches, and will be shaded by lath screens on 8 foot pos. Beds are on sandy land, we 1 fertilized, originally in hardwood timber. We have nothing for sale, as we expect to invest as much more next fall in order to get stock for growing enough seed for our own planting.

Mr. Palmer, of Wisconsin, mentioned on page 29, must be satisfied to wait a long time—as he says, "Twelve or fifteen years." Bulletin No. 78, 1898, page 141. Kentucky State Ag. Experiment Station, says roots five years old (grown in rich beds, I suppose), average 2½ oz. The above is a good pamphlet.

East Cons. able, N. Y., Jan. 7.

H. P. LANGDON.

SWEET CLOVER AS A FODDER PLANT.

Reading the reports on sweet clover I have been greatly amused at the very opposite and extreme opinions which your different observers express. Is it not funny how differently different persons will see the same thing? I have been noticing this sweet clover for many years, and I'll tell you what I saw. He in Northwestern Illinois it is certainly not a bad weed. It never spreads into cultivated fields. Two careful mowings a season, for two successive years, will clean it out easily. For pasture it is worth nothing. Cattle will nibble at it, especially when it is young enough, so as to exterminate it in short order, but won't graze on it as they will on blue grass, timothy, or the real clover. They will pick at it as they will at ragweed, dog fennel, burdock, and such fodder plants. So far as bees are concerned I can't say much. On a few occasions I have seen it swarming with them while again I have passed it many times a day for weeks in succession, and have seen only a few scattered bees working at it, and that at a time when flowers were very scarce. The honey from it is not liked at all here.

W. M. S. FEHR.

Lakota, Ill., Jan. 8.

SWEET CLOVER FOR COWS AND HORSES IN KANSAS.

Friend Root:—It surely is strange why some write that cows and horses will not eat sweet clover, and others that they will. Are there not two kinds? I can not understand why it should be thought such a difficult task to kill it, as it grows at our home in Kansas. The second year it dies just like a cornstalk; and in order to get it off the ground it is only necessary to keep it from seeding and scattering the seed. I have no seed to sell, although we have had plenty to go to waste. We have gathered only what we wished to sow. Our stock eat it green. We have never cut any for them although I think they prefer timothy and clover. When we consider that different stages in the growth of any plant change it, we should be careful about hasty conclusions.

J. T. VANPATTEN.

Pacific Grove, Cal., Jan. 20.

SWEET CLOVER—WILL STOCK EAT IT?

On page 661 friend Zurburg gives his experience with sweet clover. My stock eat it because they like it. In fact, it has been a great boon to me this dry season. While my neighbors' stock were eating dry blue grass, my own were enjoying themselves eating sweet clover. To get best results for pasture, mow it off about six inches high, just as it commences to bloom. It will then send out new shoots, and bloom until severe frosts come. Sweet clover yielded honey abundantly during the severest part of the drouth.

Fancy Prairie, Ill., Dec. 14.

P. J. ENGLAND.

MORE ABOUT SWEET CLOVER.

Tell Mr. J. A. Johnson, of Greenhill, Ind., that my Ohio cows will eat sweet clover along the roadside, so there isn't any need to mow it to keep it down; and tell him if cut when 2½ feet high, and cured as other hay, then salted when put into the mow, as any hay

should be, any kind of stock will eat it, and not require to be starved to it either. Sweet clover is a great fertilizer—no question about it. We have plenty of it here, and I know what I am talking about.

Liberty Center, O., Dec. 29.

S. A. PALMER.

SWEET CLOVER FOR COWS, HORSES, PIGS, CHICKENS, ETC.

I find here that all kinds of stock will eat sweet clover. Cattle, horses, hogs, and chickens eat it. It comes up early in the spring, the first grass that grows, and the chickens pick it off and keep it close to the ground till quite late. Last summer I had some hogs shut in a pen. I cut the clover when it was from a foot to 18 inches high, and they ate it all up. Last fall we let them run out, and they ate the young clover, and dug after the roots along the road, some places a foot deep. I did not have to teach them to eat it but I had to shut them up because they were going too deep into the ground after it. I had a piece sown to sweet clover along my pasture fence, on a piece of waste ground between my neighbor and me. The cattle would reach through the fence, and they reached so far they would break the wire, and sometimes break the posts. My neighbor came one day and found them through the fence. He said, "Those cattle are reacting for that sweet clover. I am surprised to see them eat it. I did not suppose that anything would eat it." He asked me if he could have some of the seed. I told him he could; and when he cut his grain he turned in with the binder and cut a swath and banded it. The cattle were not reaching through the fence because they had no feed for the pasture was good inside. Those who can't get stock to eat clover should turn them out early in the spring, and they will eat it all right.

Our bees did well last summer. We got 1000 lbs. of honey from 11 colonies, spring count, and increased to 20 colonies. They are in winter quarters, and seem to be doing all right.

R. CHINN.

Wakefield, Neb., Jan. 28.

THE NEW RUSSET (SCAB-PROOF) POTATO.

I planted them the 10th of May on ground where I raised the Freeman variety last year that were so scabby they were not marketable at all. They came up well, and yielded me 12 bushels of very nice potatoes, clean and smooth. I have not found a rough or scabby potato in the entire lot. The volunteer Freemans that came up among them are so scabby they are fit only for stock feed. The tubers are somewhat pointed at the outer end, but not enough to injure the potato. I distributed about two bushels of them among my customers, to learn something about them as a table potato, and heard only the most satisfactory reports of them. They are reported to be the most solid and white-t potato grown. The samples created quite a demand for them to the exclusion of other varieties. I shall give them a more extended trial next year. Owing to the long hot dry summer and fall in Southern Illinois, our Irish potatoes are nearly all raised under wheat straw, which is spread over them when they are beginning to come through the ground. This makes a very smooth and pretty tuber.

Marissa, Ill., Nov. 25.

W. M. LITTLE.

Thanks for your report, friend L.; but I am sorry to say we had some russet potatoes last year on some ground very badly infested with scab that were either scabby or affected with something that looks very much like it.

THE SOY OR SOJA BEAN.

In 1900 I ordered soy bean seed from you. It grew very tall, and made the best protein hay we ever raised. I sowed it the 4th of June, and cut it about Sept. 15 for hay. This period covered 103 days. We let an acre stand for seed till Oct. 10, when frost stopped the plants maturing perfect seed. This was 124 days. Now, what I wish to ask you is this: Do you know an earlier variety of this valuable plant? Is there a variety that will mature seed in 100 days? I notice in reading the Farmers' Bulletin, issued by Department of Agriculture, Washington, that several varieties are spoken of. It speaks of one variety maturing seed in Massachusetts. I am looking for a variety that will mature seed in this latitude—northern part of Holm's Co.—from the time it is safe to plant in the spring. The kind you sent me in 1900 must have been a late

variety, judging from the enormous growth of plants, some being 4 feet or more in height. C. O. SNYDER.
Millersburg, O., March 6.

Friend S., we have kept for many years two kinds of soja beans—the kind we sent you, which is the staple sort found in the markets, and the smaller or earlier kind called the American coffee-berry, which we have mentioned so frequently. The only objection to this early kind is that it does not furnish nearly the amount of feed or material to plow under that the late one does, and our stock of this seed this year is quite limited. For forage purposes I believe it is pretty well settled that the late large kind is the best, even if you have to have your seed grown in the South. It is now offered for sale in the southern cities by the carload, at very low prices.

THE TONGAN BEAN.

I have had Tongan vines each summer for several years, but the past summer failed to mature the seed. It is a rampant grower and makes a fine shade. From the very large nodules on the roots I should think it would make a good land-enricher.

Washington, D. C., Jan. 27. C. A. JOHNSON.

I have been considerably disappointed in years past because we did not get more reports from the new things I have recommended and offered to our friends for trial. One of these is the Tongan bean; and here at this late date we have a good report. We can still furnish seed in five-cent packets.

PURE WATER TO DRINK.

My Root.—In GLEANINGS for May 1, 1898, you wrote an article on pure water, and mentioned the sanitary still made by the Cuprigraph Co., that you were then using. I wish to know if it still continues to give you the same satisfaction that it did at that time, and also as to its durability. JOHN R. COLVIN,
Olyphant, Pa., March 7.

For three or four years past I have used only distilled water—that is, unless I could get nice rain water without much trouble. Sometimes when there is a big shower we set a lot of tin pans outdoors, and the water thus caught is just as good as that from the sanitary still—in fact, it is practically the same thing. After our slate roof has been well washed from coal smoke by a heavy rain we turn the conductor, and run the water off into stone crocks. This does very well, but it is not equal to the rain water that has not been on the roof at all. While in the Traverse region I drank water from a rain-barrel, that came from a roof made of new cedar shingles. The cedar gave it a resinous flavor that I found rather pleasant, although Mrs. Root could not stand it at all. Well, of late our sanitary still has been standing idle because I discovered the rain water from the glass roof of the greenhouse was so near like that from the still I could hardly tell one from

the other. So you see circumstances must govern the matter. In our locality, with the smoke and soot from our factory and from two lines of railway blowing toward our house, it is a hard matter to keep the rain water real nice—that is, where it is drawn from a cistern. Mrs. Root is now petitioning for a second cistern, to be filled with water that falls in the winter, and to be kept for drinking purposes and nothing else. With my poor digestion that has troubled me for many years, especially when I am confined to office work, I find it of very great importance to comfort and health to be very careful in regard to the water I drink. When I am at work almost all the time in the open air, I can drink almost any good well or spring water; but almost every well, and, in fact, the greater part of the running springs, contain more or less minerals; and until one becomes accustomed (or, as you might say, acclimated) to this especial kind of water it is likely to give trouble. Of course, *distilled* water is *absolutely* pure; and where there is any suspicion that the water is causing trouble with the digestion I would assuredly try the effect of drinking only pure soft water.

Special Notices by A. I. Root.

PRIZEWINNER BEANS—AN ERROR.

On page 168 I said these beans would be, quart, 20 cts.; by mail, 24. As the postage on a quart of beans is 15 cts. instead of 4, the price should be, 1 qt., post-paid by mail, 35 cts.

Yes, and I made another mistake on page 168. I said there were 152 beans on one stalk. My young friend Alice Hilbert, who counted them, corrects me as follows:

DEAR MR. ROOT:—There were 36 pods and 104 beans on one of the biggest stalks. ALICE HILBERT.
Bingham, Mich., March 4.

ADVANCE IN PRICES OF CLOVERS, GARDEN SEEDS, ETC.

Instead of catalog prices on white Dutch clover read bushel, \$12; ½ bushel, \$6.25; peck, \$3.25; 1 lb., 25 cts. Sweet clover, 100 lbs. at 10 cts. per lb.; 10 lbs. or more at 12 cts.; 1 lb., 15 cts.; if wanted by mail, 10 cts. additional.

The above is for sweet clover with the hulls on. The hulled seed (sometimes called Bokhara) will be just double the above prices. I do not expect any decline in the above until the new crop is harvested.

Orange Danvers carrot, half-long, 1 oz. 5 cts; 1 lb., 50. Breadstone turnip. Ounce, 10 cts.; 1 lb., \$1.00.

Add 10 cts. per pound on all seeds ordered by mail.

Our seconds of early potatoes are sold out, and we have only a very few of the seconds left of the Craigs; so the Craigs are the only kind of potatoes we have for \$2.40 per barrel for seconds. Of firsts we have all kinds, however, at \$3.50 per barrel.

HUBBARD SQUASH SEED—PRICES ADVANCED, ETC.

Last year we sold about a bushel of Hubbard squash seed that were grown by a bee-keeper, who said they were from nice squashes from seed obtained from us. Now, we have not had one single complaint from abroad in regard to those squashes; but a neighbor says he planted that seed, and did not get a real Hubbard squash from the lot, but he had a good many other kinds. The mystery is, why not one complaint has come besides this from our neighbor. On our own grounds we did not raise a squash because the boys said when I was up in Michigan the bugs ate them all up in spite of anything they could do. If I had been there, no doubt we would have had some squashes. The vines were running, and looked well when I left. The seed was very handsome-looking, and germinated

nically, both in the greenhouse and outdoors. As a rule we prefer to get all of our seeds from some man who has a reputation at stake, like our great seedsmen; and we seldom buy any thing, even of as good a man as a bee-keeper, in the way of seeds. I can hardly think it possible we have a bee-keeper in our land—that is, one that is a real substantial man like the one I bought these seeds of—who would send out a bushel or more of seeds that he knew would swindle and injure every purchaser. Now, will not all of you who bought Hubbard squash seed of us last season tell us on a postal card whether it is true to name? We want to vindicate our friend who furnished us the seed. True Hubbard squash seed is now very scarce and high. The best price we can possibly make is: Ounce, 5 cts.; 1 lb., 60; 5 lbs., \$2.75; 10 lbs., \$5.00.

THAT BEAUTIFUL LARGE POULTRY-BOOK SENT FREE OF CHARGE TO SUBSCRIBERS TO GLEANINGS.

We are having a "raft" of calls for the poultry-book, and quite a few of the friends are forgetting to send 6 cts to pay postage. Others are sending the postage without any dollar. Of course, they say they sent a dollar a spell ago, etc. Now, we do not like to be close; but, dear brothers and sisters, I think we shall have to say that you must either send the dollar in addition to the 6 cts., before we can send you the poultry book, or else your subscription must be already paid for at least a year or more ahead. We can not send the book to any one who sent a dollar several months ago; and although 6 cts. is a small sum to h-ggle over, if we give you the book right out you must pay the actual postage. By getting these books by the hundred or thousand, they are made at an astonishingly low price, and we can manage so as to make the low offer of the poultry book. But please keep in mind that Uncle Samuel does not sell postage-stamps any cheaper, even if you buy a ton. We give away books and some other goods, but we really can not give away postage-stamps.

POTATOES FOR PREMIUMS.

We are having something the same trouble with potatoes. Any one who sends a dollar for GLEANINGS, asking for no other premium, may have 25 cents' worth of potatoes, according to prices in our seed catalog. You can have your premium potatoes sent by mail, express, or freight; but if you want them by mail, you must send the money for postage. For 25 cents you can have 5 lbs. of potatoes; but the postage and packing amounts to 10 cents for each pound; and I do not believe you want to pay 50 cents in postage for 25 cents' worth of potatoes. As a rule, potatoes should go only by freight; 25 cents' worth is hardly enough for a freight shipment; so by far the better way would be to have them shipped by freight with other goods. The express charges on only 25 cents' worth are very often as much as the postage, and sometimes more. Now, when you ask for potatoes for premium, will you please be sure to say how they are to be sent, so our clerks in the rush of the busy season, will not be obliged to puzzle their heads and go from one to the other and ask what to do under the circumstances?

THE EVERLASTING METAL LABEL.

I can think of hardly any one thing that has bothered me more than to keep the names of trees and plants scattered over the fields, as well as the names of new things in the greenhouse, so they will not get lost or become so dim they can not be read. Outdoors the label has got to stand sun, frost, snow, and rain. In the greenhouse it has got to stand dampness, and possibly be spattered with muddy water. Sooner or later every label we have ever got hold of has become illegible, and then it was gone entirely. Well, Willis G. Young, of Dayton, O., has got something, for either tree or pot, he says will never rust, tarnish, corrode, break, split, nor fade; and, judging from samples he has sent me, I think probably he is right. The label and wire are, I suppose, of aluminum. If you are selling plants, and want a lot of the same kind, the name is stamped on the metal. If you want only one of a kind he sends along a little steel marker, with which you can write on the metal almost as easily as you can with a lead-pencil. Price, including marker, 40 cts. per 100; still lower figures by the thousand. I regard it as an acquisition. See ad. on page 260.

NEW RURAL BOOKS.

The O. Judd Co. have just sent out three new ones. The first is entitled "Prize Gardening; How to Derive Profit, Pleasure, and Health from the Garden." Cloth-bound, 323 pages; price \$1.00. This book is mostly a

series of letters from men, women, and children who have made a success with different fruits and vegetables, flowers included, in towns and cities as well as in the country. The book is peculiarly interesting, as it consists of accounts of what has been done. It is filled with beautiful photos, making a series of object-lessons, and showing just how and in what manner certain desirable things are done.

Another book is devoted entirely to asparagus—its culture for home use and market. It tells all about raising the crop, from the seed to the mature product ready for the table; and it also tells about selling to the best advantage. By Dr. Hexamer. Forcing in hot-beds and frames is most fully discussed; also forcing in the open field by running steam between the rows; and finally there is quite a chapter, with several illustrations and full particulars, about putting up asparagus in cans. The size of the book is 5x7, 170 pages, bound in cloth. Price 50 cts. postpaid. Either of the above books can be ordered from this office.

FRUIT-HARVESTING, STORING, MARKETING, ETC.

It has been well said that it is an easier matter to grow stuff than to sell it at a proper price after it is grown; and many men fail, not because they are inexperienced in getting a crop, but because they do not know how to sell their crops to the best advantage. This is the first book of the kind we have had as an aid in selling. It not only tells all about picking, sorting, and packing, but gives all the best methods for storing for one or two days or a longer time. It also tells about evaporating and canning when there is a glut in the market. It discusses fruit packages and commission dealers, and even takes in cold storage. It is a new book of 250 pages, full of illustrations. Publisher's price \$1.00. We furnish it to our readers for 75 cents; by mail, 10 cents extra.

While admiring these new books devoted to special subjects I fell to thinking how the world nowadays has branched out into specialties. We used to have books devoted to agriculture, some of them attempting to cover the whole field. A little later horticulture and agriculture became separate. Pretty soon fruit-growing and market-gardening were discussed separately, and then gardening under glass became a separate line of work from outdoors, and florists began to confine their attention to flowers and nothing else. When our advertising agent, a few days ago, sent our advertisement to a local publication they objected to it because it was not in their line of business; and I am really glad to see a periodical that objects to advertising any thing of any kind that is not in line with that particular class of journal. Well, just yesterday I got quite a pretty little book in paper covers, devoted to the cultivation of the petunia. It is not a book on flowers—it is devoted to just one flower. The author of the book has originated the famous star-petunia, and he will send the book, telling all about it, on application. Address A. B. Howard & Son, Belchertown, Mass.

Do you want an incubator? See advertisement of Sure Hatch Incubator Company, on page 259.

I have bought a new job-press—as good a press as money can buy. It has all of the latest improvements and attachments that enable the printer to do the BEST work, and do it QUICKLY. It has a throw-off, depressible grippers, double revolving ink-disc, etc. It has three inking rollers that pass over the type twice between each impression, thus securing a perfect distribution of the ink, and a thorough inking of the type.

I have also bought a series of eight sizes of a new style of type—Engravers' Gothic—designed especially for use in printing fine stationery; and, to show what nice work I can do, I will furnish 100 sheets of the finest commercial note-heads, and 100 of the finest white-wove, high-cut, XXX envelopes, all printed with your name, business, and address, and send them, postage paid, for only \$1.25! The ink used will be photo-brown, which gives a much richer effect than the ordinary black. This batch of stationery, and the Bee-keepers' Review one year, for only \$2.00. The stationery, the Review, and a queen of the Superior Stock for only \$3.00; queen alone, \$1.50.

Prices on larger quantities of stationery, or on labels, cards, catalogs, or other kinds of printing, will be given upon application. I shall be glad to correspond with any one wishing fine work done in two or more colors, or on tinted or colored stock.

W. Z. Hutchinson, Flint, Michigan.

Listen, Bee-keepers!

The Lone Star Apiarist

A new bee-journal in the great Southwest, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world. With flowing wells, and the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now, \$1 a year. The *Apiarist* is not only for the South, but for all America and foreign countries too. Our company has purchased the *Southland Queen*, and now we have the only bee-journal in the South.

Beautiful, Fragrant Cinnamon Vines.

Beautiful Leaves, Dainty Flowers, Exquisite Perfume.

The Cinnamon Vine, from the Oriental land, is one of the most charming of climbers, and will quickly surround your arbor, window, or veranda with a wonderful profusion of vines covered with handsome, glossy, heart-shaped leaves and sweet-scented flowers, making it a perfect bower of beauty. PERFECTLY HARDY—thriving everywhere, and once planted will grow for many years, and be a source of constant delight to the possessor. The vines often run 25 to 40 feet, and when trained over and about a window or veranda are universally admired, while their many clusters of delicate, unique white flowers send out an amount of delicious fragrance that is as truly wonderful as it is indescribable.

Beautiful, Hardy, Entrancingly Fragrant.
Grows in Shade or Sun—Wet or Dry.
No insects Ever Trouble—No Winter Harms.
Once Planted Will Grow a Lifetime.

Every one should plant these lovely vines. No home is complete without them. They stand the hardest winter without injury, and burst forth in all their marvelous splendor very early in the spring—as fine a climber as any lover of beautiful flowers can wish.

IT ALWAYS PAYS TO
Make Home Beautiful.

BE SURE TO READ THESE TESTIMONIALS.

Lydia and M. J. Clarkson, Authors of "Art Studies," write:—No vine ever gave us so much continued pleasure. The growth is truly phenomenal. Its handsome foliage and fragrant blossoms commend it to every lover of flowers. If its merits were more widely known you would be overwhelmed with orders.

Mrs. C. Hensley, Barnard, Ind., writes:—The Cinnamon Vines you sent me grew 30 feet last year, and were the talk and wonder of the neighborhood.

From the Gentlewoman Magazine, New York:—The Cinnamon Vine—new from China—will thrive everywhere, and when once established will grow forever. Its fragrance is as truly wonderful as the beauty of the vine itself. The roots recently sold for \$10.00 each.

S. Wilson, Pa., writes:—The Cinnamon Vine blossoms as freely in the house as outdoors, and will fill a room with a delightful fragrance in the cold and dreary month.

W. Weeks, Barre, Mass., writes:—I enclose order for 100 more vines. I sold the last lot in fifteen minutes.

Safe arrival guaranteed.

The Fred W. Muth Co., Front and Walnut, Cincinnati, O.

Queens You Should Have

Does blood tell in other stock? Give your bees a chance. Stock used for breeding the queens offered—not from a sport, but my pick out of an apiary giving last season an average yield as follows:

Honey Gathered.

102 lbs. extracted and 68 lbs. comb honey per colony besides increase and stores for winter.

Quality of Comb Honey Produced.

"Man! It would dazzle you."—Wm. McEvoy, Ontario Government Inspector of Apiaries.

Wintering Qualities.

Up to the present, January 30, I never found these bees to show the least indication of unrest—always perfectly quiet. They are wintering perfectly.—Frank T. Adams, Brantford, Canada.

General Commendation.

Out of those queens you sent me I have produced the best race or strain of bees I ever owned. Remember that is saying a lot, as I have tried every breed imported to this country. The bees winter better, build up, and stand cold chilly winds in spring better, and are more suitable than any bees I ever owned. For the season they gave me about double the honey the pure Italians did, and more increase. Glad you are going into the queen business, and are going to join our ranks again. We are much in want of a few men like you. C. W. Post, Ex president Ontario Beekeepers' Association (owns 365 colonies).

S. T. Pettit, Canada's most successful comb-honey producer and bee-keeper, says: "The blood in my apiary is largely the progeny of queens sent by you, and they are grand bees."

Prices of Queens.

They are duty free to the United States. Tested, \$2.00 each; \$10.00 for 6; \$18.00 per dozen. Untested until July 1st, \$1.25 each; \$7.00 for 6; or \$12.00 per dozen. Same after July 1st, \$1.00 each; \$5.50 for 6; or \$10.00 per dozen. Larger quantities, prices on application. Postage stamps taken for fractions of a dollar. To be fair to every one, no selected tested queens are offered. Every one has the same chance. The above queens are bred from a careful selection of Italians and Carniolans. Pure Italian and Carniolan queens same price. Price of full colonies on application. Orders booked as received, and filled as quickly as possible. Order early. Address

R. F. Holtermann,

Bow Park Co., Limited, Brantford, Ontario, Canada.

A QUEEN FREE.

Our stock is the very best that money and experience can procure. Just give our stock a trial and be convinced. We will give one warranted queen free in July for every order for one dozen queens before May 1, in order to have you try our stock. Prices: Untested, each, \$1.00; 6 for \$5.00; 12 for \$9.00. Select tested, \$2.50. Tested, \$1.25. Two-frame nucleus and warranted queen, \$3.00; three-frame nucleus and queen, \$3.50. Send for our catalog of bee-keepers' supplies and our price list of Italian queens and nucleus colonies, with description of our strain of bees.

A FEW REASONS WHY

You Should Buy "The Hardie" Spray Pump in Preference to One of Any Other Make.

Every pump we make is supplied with our strainer and agitator. Strainer is on side of extreme end of suction pipe. The agitator rod moves the agitator up and down in front of the strainer every time the pump handle is worked. See cuts. This insures thorough mixing and prevents burning or scalding of plants, vines, etc., from heavy deposits of poison. It is an invaluable feature in painting and whitewashing. "The Hardie" is the only pump that requires no wrench to get at the valves. The stroke may be instantly adjusted to any desired length, by simply changing a pin in the handle. Our brass plunger is the most simple, durable and serviceable on any pump. "The Hardie" is a large capacity pump. The pump here shown is our No. 7. When this pump is worked at the rate of 30 strokes per minute it will reduce to fine spray 187 gallons of liquid per hour. All the "Hardie's" easily maintain a pressure of 100 pounds with two nozzles open. Think about these things and then send for our free catalog.

THE HARDIE SPRAY PUMP MFG. CO.,
63 Larned Street, Detroit, Michigan.

ELECTRIC Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous Electric Steel Wheels, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. Why not get started right by putting in one of these wagons. We make our steel wheels to fit any wagon. Write for the catalog. It is free.

ELECTRIC WHEEL CO., BOX 95, QUINCY, ILL.

Beat the Bugs

Such things as Codling Moth, Curculio, Green Aphid, Scaly Bark, San Jose Scale, Blight, Etc., can only be defeated by frequent and persistent spraying. *The*

Spramotor

has proven to be the best all round spraying outfit on the market. Was awarded Gold Medal at Pan-American Exhibition, and winner of the Canadian Government Spraying Contest. We mail free, booklet "A Gold Mine on Your Farm." Ask for it. Your dealer will sell you the Spramotor, or you can get it from us direct.

SPRAMOTOR CO.,
Buffalo, N. Y.
London, Can.

EIGHTEEN-INCH GEM PLANER.

We have for sale an 18-inch Gem planer, second-hand, which we are replacing with a heavier machine. We offer it for \$10 cash. Where a party wants a tool at a low price, which will do good work, this is a bargain.

HONEY MARKET.

We have just received another large car of extracted honey from California, and shall be pleased to hear from those in need of choice honey for bottling. This consists of white and light amber.

We have been moving off our stock of comb honey quite freely lately, but still have a good stock, and solicit inquiry from those in need. Now that the weather has moderated it can be shipped safely.

MAPLE SUGAR AND SYRUP.

The season for these delicious sweets of the sugar maple is here, and from present indications it promises to be short. We expect to supply our customers as usual. It is rather early yet to fix a definite price, but we shall doubtless be able to furnish it at the usual price, \$1.00 per gallon for choice syrup, and 10 cts. per lb. for best grade of sugar. We shall be pleased to hear from those interested.

FAVORITE FAMILY SCALES.

In our catalog for this year there occurs a misprint on the price of the 24-lb. Favorite family scales. The catalog reads \$2.75 each, when it should be \$1.75, the same as the 12-lb. They are the cheapest scale we know of for the capacity, as well as the most convenient, and we are selling this year for \$2.25 one of the 48-lb. capacity. The divisions on the dial of this being closer, it will not be as handy for weighing small amounts as the one of 12 lbs. capacity.

BEESWAX WANTED.

The market for beeswax continues firm, and prices are ruling a little higher. We advance the price we pay to 29 cents cash, 31 cents trade. We hope we shall not have to advance any further. If we do we shall have to advance also the price of foundation. If you have any wax to sell or any old combs to make any, let us have an early shipment. As soon as we secure enough for this season's needs we will make the price down again. Too often in the past, parties have held their wax a little too long to secure the best price.

BUSINESS BOOMING.

We are well nigh swamped with orders. Two months ago we were about 20 cars behind, but we kept gaining till toward the last of February, when we had only about 12 ahead of us. Since then they have come in again in such numbers that, at this writing, we are 16 cars behind. We are running our factory 11 hours a day, and our shipping department still longer, and doing our utmost to keep pace with the orders, and catch up a little closer. Prospects are promising for a good season, and it behooves the fore-hand to be prepared in time.

Kind Words from our Customers.

Please do not mark my name with a D (discontinue), for I would rather you would use a C (continue). So, for a renewal, here is my dollar; and now for GLEANINGS, just hear me holler. Three cheers! Hip, hip, hip, hurrah for GLEANINGS! LEWIS HOCKETT.
Fairmont, Ind., Jan. 22.

To The A. I. Root Co., San Antonio, Texas:—I received the goods all right. I am certainly well pleased with them. They are the best hives I ever saw. Please accept my thanks for the nice way they are packed. J. W. WOLF.

Mineral, Texas, Feb. 15.

THE NEW MATTITUCK ERFURT CAULIFLOWER (IMPROVED SNOWBALL) SEED.

Inclosed find \$1.75, for which please send me by mail one ounce of the Mattituck Erfurt cauliflower seed. I got an ounce last year, and it was by long odds the best I ever grew. JOHN G. GRAY.

St. Catharines, Ont., Dec. 21.

Mr. A. I. Root:—In reading your Home paper last evening in regard to the Biddle affair, it occurred to me that, if you would pick out the cream of your Home papers, and put them in book form, I should be pleased to get one or more and have them placed in our libraries. I lent your Adam and Eve story to my brother Jacob (of happy memory, Judge of Haliburton), and he gave it to a man who came to him for a divorce, and who, after reading it, saw his error and returned the journal to my brother, with many thanks, as it had completely reconciled him and his wife to each other, at least, and may we not hope to God also? Little Britain, Can., Feb. 28. F. WHITESIDE.

Mr. Root:—Our Homes is very interesting to me. We have been in Colorado 15 years, and this year is our first with the journal here. We were from Ohio originally, and husband was a great bee-man—a regular subscriber to your journal, and got many supplies from you some 25 years ago. I read the Home papers when Huber was a cute little fellow, and when Blue Eyes was so often spoken of; and to have the journal again is like a drink of water to a thirsty traveler. Husband, of course, was more interested in the bee business. H. S. Shull Wellsville, Ohio, was our old home address. I want to tell you why the journal which came to day was so interesting. The reading about the little home in the woods, the companion ship of 40 years of married life (which is our length of time together), all appealed to me forcibly. You will always have interested readers of the Home papers, as they are written differently from any thing found elsewhere. You write honestly, and plain-spoken, without fear or favor to any one.

MR. AND MRS. H. S. SHULL.

La Junta, Colo., Nov. 20.

Mr. A. I. Root:—It was your article in a back number of GLEANINGS where you spoke of dear Mrs. Root wishing to do her "own work." Yes, it was that picture of true home life which has made me a humble subscriber to GLEANINGS. I thought you were talking to my wife all the time. She, too, won't have a hired girl in the house, although we are both 75.

You are tolerable on "bees and horses," but you don't touch the living spot till you write out your everyday experiences; and after reading them I could almost run to Medina and throw my arms around you, and wish I was $\frac{1}{4}$ as good a Christian.

Waterbury, Ct., Dec. 30.

B. S. HOTCHKISS.

Why, dear friend H., you do not realize how extravagant you are in your talk especially for a man 75 years old. You do not know what a predicament you would be in if you were " $\frac{1}{4}$ " as good a Christian as my poor self. If you should talk with my next-door neighbors, especially a certain one who does not fall in with my erratic ways, you might change your mind. May God bless you and your wife. I wish you could come and make us a visit when we get up to our "cabin in the woods" again.

As we are snowed in up on these mountains I thought I would write you. I have been thinking for almost a year that I would do so. When our boy wanted a dollar to send to you for GLEANINGS I said, "I guess father would not want you to spend money in such a foolish way." As his father is a Christian, he wants his children brought up in the good way; but the boy said, "There is as good reading in the books as you will hear preached," and so I said I would like to see some of them, as I had never read anything in any advertising book yet that was as good as what you would hear at church. So the boy brought me three of them that some friend had let him take, and I saw at once that they would be a help to him, and gave him the dollar. This was one year ago, and *this* year I gave him another dollar for it. I think the lesson that you have in about the Biddle brothers pays for the book this year.

I don't believe in secret societies, and I hope that the Lord Jesus Christ will keep me so that I never will want to belong to any. I have been a Christian for ten years, and I love to read God's word; and, so far, in reading your journal I have been strengthened. I often think of your text, "And the Lord God said unto

the woman. What is this that thou hast done? And the woman said, The serpent beguiled me, and I did eat."

You will find almost every time any thing happens that a woman is about, somewhere; although I am of that sex I don't want to do as I have seen and known some to do.

MRS. THEO. ALLEN.

Prospect, Ct., Feb. 24.

Mr. Root.—I have at last received the hives you so kindly donated to my mission. I have not yet been able to get them over the mountains, but I hope to make you a good report in the course of time. It was most kind of you, making me this donation. I hope there will be good results from it.

In moving forward to this new country, in my missionary life I have struck quite a new manner of life among the natives. It is a new mine from which to dig jewels for the Lord's crown, and promises to be most fruitful. We have now occupied some over 20 villages, and there is a much larger call for help from the heathen. We meet with many obstacles, and have already our first martyr, a grand man saved by grace, and assassinated because of his new life. I have been now over 36 years in this work, separated from my family—my "Blue Eyes," now, for 12 years, for this work's sake; but it is the very work of God. How deeply I sympathize with you in your Home Papers. They are admirable, and of God. I am most thankful God ever led me to know A. I. Root.

A. BUNKER.

Loikaw (Foungkaw), Oct. 31.

ONLY 20 LEFT.

We have left some of those slightly damaged copies of Prof. Cook's "Bee-keeper's Guide" that went through our fire a year ago. The reading matter is all right—only the cloth covers are somewhat damaged. Price, to close out, 60c a copy, by mail; or, with weekly *American Bee Journal* a year, both for only \$1.40. Regular price of the book alone is \$1.25. Big bargain where you get both book and Journal (52 copies) for \$1.40. Better order quick if you want book on either these low offers. Now is the time to begin to read the *American Bee Journal*. It will continue to be a great paper in 1902. And it comes every week.

We are headquarters in Chicago for Root's Bee-keepers' Supplies. Catalog, and sample of *American Bee Journal* free.

FOR SALE.—Will sell cheap, one 10 h. p. engine with upright boiler all complete.

J. W. BITTENBENDER, Knoxville, Iowa.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, thus: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My nice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present.—M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albinoes, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Bees by the point, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

The Jennie Atchley Co., Beeville, Tex.

Now Ready!

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.

Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy-White," "No. 1 Dark," etc.

CITY MARKETS.

BOSTON.—The demand for comb honey remains good. Market ranges as follows: Fancy, 15¢@16¢; A No. 1, 14¢@15¢; No. 1, 13¢@14¢; honey in glass-front cases about 1¢ less. California light amber, extracted, 7¢@7½¢; Florida honey in barrels, 6¢@6½¢.

BLAKE, SCOTT & LEE,
March 20. 31, 33 Commercial St., Boston, Mass.

CHICAGO.—Continued depression in the trade owing to light output on the part of retailers and the desire on the part of those having stock on hand to dispose of it. The past two weeks have noted a further decline in price of comb honey, with the exception of basswood, which is scarce, and wanted at two to three cents above any of the other white grades and now brings 14¢@15¢; alfalfa and other fair white, 10¢@13¢; ambers, 8¢@10¢. White extracted dull at 5½¢@6½¢; ambers, 5½¢@5¾¢; Southern and dark, 5¢@5½¢. Beeswax scarce, and wanted at 30¢.

R. A. BURNETT & Co.,
March 19. 199 South Water St., Chicago, Ill.

ALBANY.—Honey market bare of comb here, and none selling less than 15¢. Extracted dark most in demand at 9½¢. Beeswax wanted at 29¢@30¢.

MACDOUGAL & Co.,
March 13. 380 Broadway, Albany, N. Y.

CINCINNATI.—The general tone of the honey market is lower. Water-white comb honey sells from 14¢@14½¢, and is hard to obtain; extra fancy, 15¢. Extracted has weakened a little, and sells from 5¢@5½¢; fancy, 6¢@6½¢.

C. H. W. WEBER,
March 19. 2146 Central Ave., Cincinnati, Ohio.

DENVER.—Demand for strictly No. 1 comb honey is fairly good; off-grade and No. 2 selling slow, and prices on these have to be shaded to effect sales. No. 1 white comb honey, \$2.65 to \$2.85 per case of 24 sections; No. 2, \$2.25 to \$2.50. Extracted, 7 to 7½¢ per lb. Beeswax, 24 to 26¢.

COLORADO HONEY-PRODUCERS' ASS'N.,
Mar. 20. 1440 Market St., Denver, Col.

SCHENECTADY.—There is but little comb honey remaining on our market, and that is white. We quote fancy 15¢; fair to good, 13¢@14¢. There is quite a little demand for extracted light—light selling at 6¢@6½¢; dark, 5½¢@6¢.

CHAS. MCCULLOCH,
March 19. 1 Eagle St., Schenectady, N. Y.

MILWAUKEE.—The condition of this market on honey remains about the same as when last reported. The receipts have been fair. The stock is not large, yet sales seem to drag, especially on the extracted. The best comb honey is in fair request, while the supply is small. We now quote fancy 1-lb. sections, 14¢@15¢; No. 1, 13¢@14¢; off grades, nominal. Extracted, in barrels, kegs, pails, and cans, 7¢@8¢; amber, 6¢@7¢. Beeswax, 26¢@28¢.

A. V. BISHOP & Co.,
March 19. 119 Buffalo St., Milwaukee, Wis.

SAN FRANCISCO.—Comb honey, 10¢@12¢. Extracted, water white, 5½¢@6½¢; light amber, 4¢@5½¢; dark, 4¢@5¢.

March 13. E. H. SCHAEFFLE, Murphys, Calif.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.

EVANS & TURNER,
Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity.

R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

WANTED.—Extracted honey, either large or small lots; parties having same to offer, send samples, and best prices delivered, Cincinnati, O. We pay cash on delivery.

THE FRED W. MUTH Co.,
Front and Walnut Sts., Cincinnati, O.

WANTED.—Comb honey in Danzenbaker sections. We can use both white and amber.

THE A. I. ROOT Co., Medina, Ohio.

FOR SALE.—A quantity lot of well-ripened clover honey in 60-lb. cans.

B. WALKER, Clyde, Ill.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.80, per case of two 60-lb. cans, net.

ARKANSAS VALLEY APIARIES, Las Animas, Col.

FOR SALE.—Two grades fine amber honey at 6 and 6½¢ respectively, and white honey at 7½¢ per lb., f. o. b. here. Sample free.

O. H. TOWNSEND, Otsego, Mich.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.

WM. MORRIS, Las Animas, Col.

FOR SALE.—Extracted honey, from alfalfa, at 7¢ per pound. Send for sample.

D. S. JENKINS, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7¢, in kegs and cans.

DR. C. L. PARKER
Sta. A, R. F. D., Syracuse, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere that they will have to offer.

SEAVEY & FLARSHEIM,
1318-1324 Union Avenue, Kansas City, Mo.

The "Triumph" Fish-hook.

Holds any species of fish.
The fish bites the middle hook.
The side hooks close down as he pulls.
The more he pulls the tighter he is held.
Is a combination of a fish-hook and a gaff.
Will catch any fish—minnow to cod.
For trolling, casting, deep-sea fishing.
Four sizes. State which is wanted.
Dozen, \$1; alike or assorted. Sample, 10¢.

F. J. Root, 90 W. Broadway, New York.

Foot or power; has a 6-foot bed; screw and gear cutting, and wood and steel turning attachments and tools. Of good make, in fine order, and a bargain at 1-3 cost. Tor. Poolittle solar wax-extractors (Root's make) in fair order, will last for years, at 75 cts. each. Also pulleys, shafting, and other tools and articles for sale. For lists and prices, please address W. J. FINCH, JR., - - CARLINVILLE, ILLINOIS.

Victor's Strain of Italian Bees Awarded the Diploma as Being the Best Bees at the Pan-American.

BUREAU OF AWARDS.

PAN-AMERICAN EXPOSITION,
BUFFALO, NEW YORK, U. S. A.
February 12, 1902.

Mr. W. O. Victor, Wharton, Texas.

Dear Sir:—I have the honor to advise you that a Diploma of Honorable Mention has been awarded to you for your exhibit of Italian bees at this Exposition.

Very respectfully, WM. I. BUCHANAN,
Director General.

Orel L. Hershiser Bought of Me an Untested Queen. This is what He Says of Her Colony:

"They are very industrious characteristically marked, and extremely gentle. It was a daily experience, and repeated many times daily, to go into the inclosure with interested visitors, at the Exposition, open the hive, full to overflowing with beautiful bees, the progeny of the queen you sent me, and handle them in the various manipulations of hunting out the queen; shaking the bees from the comb, as is done in extracting, showing the brood in all stages, etc., all without the use of a smoker or any thing else to quiet the bees, and I do not recollect that any one ever got a sting from any of them."

Of the bees I exhibited at the Pan-American, he says: "The nucleus you sent for exhibition and award was certainly very fine-looking bees, and, in my opinion, they deserve the award given them by the judges."

But Who is Mr. Hershiser?

See *Gleanings* of date of Feb'y 1, 1902, page 97. Send in your orders for queens, and in a short time, as Mr. Hershiser and hundreds of others are now doing, you, too, will be singing the praises of "Victor's Bees." Price lists on application.

W. O. VICTOR, Wharton, Tex.

Queen Specialist.

— You Need a —

Grace Queen-cell Compressor

Messrs. Giraud-Pabou & Sons, Le Landrau, France, say: "We are very successful with compressed cups. Box attachments have arrived." In January, Mr. Geo. J. Vande Vord, Daytona, Fla., ordered 200 shells, and on Feb. 28 said: "Please send 400 more immediately. I now find them to work all right." "A grand invention," say the Atchleys. Another has said, "Removable queen-cells are as valuable to the queen-raiser as removable combs are to the honey-producer."

Great, Fine Cells Secured Each Time.

Order a press and have it on hand. By post, \$2.00; with other goods, \$1.75. Shells, 1c—use them over and over. A 10-box queen-fertilizing attachment will mate several queens to the nucleus colony at cost of one. Send for circular of complete queen-rearing outfits. Golden-all-over queens, \$1. E. L. Pratt, Swarthmore Apiaries, Swarthmore, Pa.

THE BEST PLACE

to send orders for queens when you want golden stock that is satisfactory (bred for honey-gathering for nearly 30 years) is to

GEO. J. VANDE VORD, Daytona, Fla.

He will treat you right, and is using extreme care in raising fine large queens. A breeder of Root's red-clover strain. Only superior drones in or near both yards. The best mailing and introducing cages made. An extra choice Doolittle golden breeder. Untested, \$1.00 each; three for \$2.25; tested, \$1.25.

A QUEEN FREE.

Our stock is the very best that money and experience can procure. Just give our stock a trial and be convinced. We will give one warranted queen free in July for every order for one dozen queens before May 1, in order to have you try our stock. Prices: Untested, each, \$1.00; 6 for \$5.00; 12 for \$9.00. Select tested, \$2.50. Tested, \$1.25. Two-frame nucleus and warranted queen, \$3.00; three-frame nucleus and queen, \$3.50. Send for our catalog of bee-keepers' supplies and our price list of Italian queens and nucleus colonies, with description of our strain of bees.

PRESTON STORE & PRODUCE CO.,
Dority, Preston Co., W. Va.

Potatoes for Sale.

Sir Walter Raleigh seed potatoes. Choice and true to name. \$1.00 per bushel, F. O. B. Charles Vanderbilt, of the New York Peerless Farm, Lyons, New York.

Sweet-Potato Plants.

Jersey Yellow, Big Stem, Jersey Red, Vineland Bush, and other kinds. Write for price list.

F. S. Newcomb, Vineland, N. J.

FLOWERS.—Strong plants from 2½-inch pots. The famous \$30,000 queen of all carnations, Mrs. Thos. W. Lawson, 15c; 2, 25c. Verbenas, 4c; 35c doz. Pansies, 25c doz. Boston ferns, 8c each. Roses, monthly bloomers, assorted colors, 10c each; 3 for 25c; prepaid. FRANK DANLEY, Macomb, Illinois.

!! WHITE LEGHORNS !!

Single comb; stock large and fine; Satisfaction guaranteed. Pekin ducks. Eggs, \$1.50 per 13. Address W. H. GIFFORD, 151 Franklin St., Auburn, N. Y.

BELGIAN HARES !

With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge. Does will be bred to one of our famous high-scoring bucks free. Write for book. Mgr. of The A. I. Root Co. J. B. MASON, MECHANIC FALLS, MAINE.

1200 FERRETS. All sizes; some trained; first-class stock. New price list free. N. A. KNAPP, Rochester, Lorain Co., Ohio.

Angora Goats

are handsome, hardy, profitable. Prize stock; low price; circular. ED. W. COLE & Co., Kenton, O.

POULTRY PAPER 3 Months

and book, "Plans for Poultry-houses," 10 cts. Paper one year and book, 25 cts, if you mention *Gleanings* (reg. price, 50 cts). Inland Poultry Journal, Indianapolis, Indiana.

EGGS from all varieties of fancy chickens FREE. Send 10c for a trial subscription to our 16-p. journal if interested in fowls, and get our FREE-EGG plan. Address The Farm & Poultry News, Box 702, Middlesboro, Ky.

White Wyandottes !

Bred from Duston's best. Stock and eggs for sale in season. Satisfaction guaranteed.

GLEANINGS IN **BEE CULTURE** A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS ILLUSTRATED SEMI-MONTHLY Published by THE A. B. COOT CO. \$1.00 PER YEAR © MEDINA, OHIO.

VOL. XXX

APR. 1, 1902

No. 7.

F. B. SIMPSON says in *Review* that inbreeding has done us remarkable service in improving our domestic animals, but only one man in a thousand succeeds with it, and that thousandth man in only one of a thousand cases. That's—let's see— $1000 \times 1000 = 1,000,000$ —one chance in a million—a rather black eye for inbreeding.

The *Lone Star Apiarist* says exposure of brood will start robbing quicker than the exposure of honey only. [I am inclined to think this is true. But, doctor, why didn't you offer an opinion? There is nothing in my experience that makes bees more ugly, and sting worse, than to give them a taste of mashed brood.—ED.]

I'VE ALWAYS HELD that, while the drones of an impurely mated queen might be affected by the mating, the effect was so slight that it was not worth considering. Now comes Prof. Cook, p. 238, and presents considerable proof that Dzierzon is entirely right in holding that the blood of the drone is not in the slightest degree affected by his mother's mating.

ONTARIO CO., N. Y., bee-keepers' convention thought what money our government expends in importing queen-bees from other lands might better be made use of otherwise.—*Amer. Bee Journal*. If my memory is in good repair, at one time some inhabitants of that region said things about me not the most complimentary just because I talked as they now talk.

FRANK B. WHITE Co., publishers of *Agricultural Advertising*, were unfortunate enough to admit in their columns the comb-honey slander. Now they have done the White thing, not only retracting, but sending to the host of agricultural papers a statement of the truth in such clear and concise terms that it stands a good chance of general publication. [Yes, indeed; the White Co. have done the *white* thing. Mr.

F. B. White himself is a gentleman who is particularly interested in bees and beekeepers, and he has gone not a little out of his way to help us offset the effect of the comb-honey lies.—ED.]

A CONTROVERSY is on, says the *Amer. Bee-keeper*, as to the proper pronunciation of "super." It says: "The man who pronounces it 'sooper' will probably find himself upon as safe ground as those who insist in perverting it into 'supper.'" Just so, Bro. Hill, but hardly safer, if both are errors. If "beauty" were pronounced "booty" by one man and "butty" by another, you would hardly denounce the last alone, but tell them they were both in error.

RAMBLER, don't you think you are blowing hot and cold in pretty rapid succession, p. 236? You first try to lull our fears lest a lower tariff may make lower prices for us, and in the next breath say Cuban comb honey is fine, and lots of it can be sold here. But we ought not to be selfish. It would be a great blessing to the country if honey were so cheap that it would take the place of half the 65 pounds of sugar annually used per capita, even if it drove us all into some other business.

THE EDITOR'S remark, page 232, reminds me that, years ago, with ten-frame hives and wide frames, I always put on 56 sections at the start, and I never had more satisfactory work. But I usually put a frame of brood above for a few days. [But at that time, doctor, the seasons were much better than now; in fact, I think you have so stated; or, to put the question in another way, would you—or, rather, do you—in actual practice put on two supers at a time rather than one? If not, why not?—ED.]

I AM SORRY to have misunderstood the work of a man to whom we are so much indebted as we are to Prof. Gillette, p. 233. Let me amend by saying, "One thing that seems settled is that *measurement* of tongue-reach is not settled by tongue-length." [But do you think Prof. Gillette will subscribe to your last statement? We consider Prof. Gillette as a man of marked ability, and we are indebted to him for his work on the matter of measuring tongues. Perhaps

his conclusions on some questions were not entirely correct; but he has given us the facts and figures so that we can draw our own conclusions if we like.—ED.]

I AM NOT "up" on the latest kinks in breeding, says Arthur C. Miller, p. 240. Please don't mention it publicly, A. C., but let me whisper in your ear that I have a larger fund of ignorance on the subject than you have yet dreamed of. But what makes me no longer on speaking terms with you is because all you fellows that are so "up" on the kinks—no, not all, I must count F. B. Simpson out—have spent so much time scolding the rest of us for ignorance, instead of using all your breath to instruct us.

A. C. MILLER seeks to impeach my witness, p. 240. He "Great Scotts" the idea of greater uniformity, with yields varying from 54 to 317. Does that detract from the force of the argument if the truth still remains that there is greater uniformity than before? But, go back to page 976 and read again. Mr. Doolittle distinctly says that the 317-pound stock was the only one of the four belonging to the stock that he has for 30 years been building up from selected freaks. Great Scott! what ails you, Arthur?

F. GREINER, p. 230, says a queenless colony can be kept building cells a long time if a comb of brood is given from time to time. In 1899 I kept a colony queenless ten weeks, and it did just as good cell-building at the last as at first. Brood and bees were all changed every ten days, except, of course, the field bees, and it was kept very strong. [According to our experience a little brood is necessary to keep the bees from getting discouraged. We make it a rule to pick out one or two colonies that show a special aptitude for building cells, and keep them at it, sometimes, during the whole season.—ED.]

MACHINE-SHOP BEES protest at 60°, page 227. No doubt that trouble was immediately corrected; for since that was written it has been 2° above zero here. But I am curious to know how much trouble there was when you opened up wide for all night. Was the roaring increased on admission of fresh air? and were they quiet next morning? [Just as soon as we could let in fresh air those bees quieted down, notwithstanding the temperature was still 60. This proves conclusively in my mind that bees can stand a much higher temperature providing they can get a good deal of fresh air. I can not quite understand why our experience should be so different from that of others on this point.—ED.]

THE IDEA that, sooner or later, all alfalfa for hay will be cut before bloom is a bit discouraging. One comfort remains: Say, it takes acres to produce seed enough for the fresh seeding needed. There will always be acres of bloom for the bees. Taking a broader view, whatever will be lost on alfalfa will help the white-clover mar-

ket. [No great loss without some small gain. I think the great reason why clover and basswood honey sells at a lower figure than it did years ago is because of the enormous quantities of alfalfa and sage honey produced in the West. It is true that more people are eating honey than formerly in proportion to the population. The increased number is not sufficient to offset the larger quantity produced.—ED.]

THE FAILURE of F. Greiner to get queens fertilized over a colony with a laying queen is about the same as my own. No trouble to have the young queens reared there, but when they should begin laying they turn up missing. Yet I did it once easily, and I believe that was the first-published case of rearing a young queen over a colony with a laying queen. To have combs preserved from worms, I piled four stories of them over a colony with a laying queen, and to make sure they would all be visited by the bees I put a frame of brood in the upper story—no excluder anywhere. Later, when I came to take them away there was a laying queen above and the old one below. A leak in the upper story allowed an exit and entrance. The Medina plan, wire cloth, is no doubt the right thing for fertilization. [Yes, try it. It works to perfection with us. Ordinary nuclei on separate stands take as much room as the full hive; but by putting an upper story on a strong colony the two parts of a hive separated by a wire cloth, one can work three nuclei very nicely. They are up a convenient height for working, and economize room, because they stand exactly in the same spot of another hive that may be and probably is gathering honey.—ED.]

Yes, cut and slash sweet clover down—

Don't stop to ask its name;
Call it a weed and grub it up,
And throw it in the flame.

Let bigotry and ignorance
Have now their fullest sway;
Don't stop to get a new idea,
But mow the plant away.

Let fragrant ragweed, burdock sweet,
And prickly lettuce grow;
It wreathes the mossback's face with smiles
To see such things, you know.

Just find the rut that father trod,
And be content with that;
He always cut sweet clover down,
And that is what we're at.

In *American Gardening* for March 8 I notice the following, from E. R. Orpet, in regard to the use of bees under glass; and while it has more to say about how to get the bees ready for their work under the glass than about the results of their work afterward, it can not fail to be of interest

to bee-keepers, and to greenhouse owners in particular. I copy nearly all of it.

BEES UNDER GLASS.

Where fruit is extensively cultivated in glass structures, the aid of the busy bee is often invoked, always with good results to the cultivator, but often with disastrous effect on the bees.

Our stocks were originally procured in the light-frame Langstroth hives; but as these were much the worse for wear, we determined to transfer to a more modern pattern, and were induced to adopt the Danzenbaker hive. Two weeks ago, the peach and nectarine buds being far enough advanced to show color, a hive was brought in, and, after allowing the bees their first flight, the frames were lifted out and the combs carefully cut to fit the new Danzenbaker frames, which, being slightly smaller, allowed of a snug fit without any wiring.

We noticed that there was lots of stores—honey—to carry the bees through until spring, and in the center of the hive was a patch of young brood and eggs as big as the palm of one's hand. This induced us to examine closely for pollen stored up, but scarcely any could be detected; certainly not enough with which to rear young brood.

A few large pots of single violets full of bloom were in the house, and the bees worked zealously over these, gathering what pollen was available; but, singular to say, they did not touch the old frames with scraps of comb full of honey that were laid round the new hive for the bees to clean up.

This set us to thinking, and it was reasoned that something was lacking, and that this must be pollen. Having read that, in the absence of this most essential article of food, rye meal had been found a good substitute, some was procured, and about a tablespoonful was heaped on the old hive-cover, which had also some honey spilled on it, and, presto! the result was a revelation—the bees came out and simply reviled in the meal. They became as white as millers, and at the end of the first day it was seen that all the coarse particles of meal had been carefully brushed aside, the whole of the fine meal being removed and carried into the hive to feed the young. And then they at once began to clean up the scraps of honey; not a particle remained at the end of the first day.

Some cultivators do not use bees to set their fruit-bloom, but it is the best of economy to let them do it. The cost of a swarm is soon outbalanced by the amount of labor expended in setting the bloom by hand.

It is a fair estimate that one house alone of peaches and nectarines would cost as much to set by hand as would buy a good colony of bees; and if these are carefully tended they come out stronger and better for their sojourn under glass, always provided that there is plenty of honey stored in the hive. Should their stores be short, syrup must be fed as well as the rye meal.

We used to have to borrow a swarm from a bee-keeper, and at first he did not much like the idea, unless we would guarantee him against loss; but the hive, when returned to him, threw off such early and very strong swarms that he had no further misgivings, and we became interested ourselves in the art, and have never before taken up a study that was at once so intensely interesting as that of the busy bee.

BEES AND FRUIT.

This is the name of a French bee journal now in its second year, of which we have just received our first copy. It is published in Alençon, France. The February issue contains a biography of Mr. Charles Dadant, with a fine view of this apicultural veteran. It states he was born in 1819. It should be 1817. We are glad to receive this new journal, as it abounds in interesting things relative to apiculture and farming generally.

BEES.

This is the short title of a new bee-paper started the first of the year in London. It is the outcome of a dispute between the pub-

lisher and editor, E. A. Geary, and the editor of the *British Bee Journal*, Mr. W. B. Carr. Last spring Mr. Geary sent an advertisement to the *B. B. J.*, headed, "Perfection at Last in Management." Mr. Carr very promptly returned the money and copy, saying he would not insert the advertisement at any price. The resulting correspondence is published in full in the January issue. After a long war of words the clarion notes of Mr. Geary's trumpet were heard on the hillside, and his sword leaped from the scabbard; and the result is a splendid addition to the apicultural literature of England, for *Bees* is in every way a readable publication. It is claimed that, where twelve colonies would be enough to keep one man busy in the old way, by Mr. Geary's new plan thirty can be managed as easily. Interesting results are expected.

PRIME SWARMS.

"Good morning, Mr. Doolittle. I am interested in the swarming of bees, and feel that I know very little about the principle on which swarming is conducted, so I came over to have a little chat with you regarding the matter."

"All right, Mr. Brown. But what started you off on this swarming matter now? Bees are not likely to swarm here in Central New York to any amount under nearly three months."

"Yes, I know that is so; but I have been looking over my back volumes of *GLEANINGS* during the stormy days which we have had along back, when I came across this in Dr. Miller's *Stray Straws*, page 511 for July 1, 1895: 'A prime swarm,' says Doolittle, p. 484, 'is often erroneously called a first swarm. Why erroneously?' I copied it off so that I could ask you if you ever answered that question."

"I do not remember whether I ever did or not; but I think it can be answered satisfactorily."

"But I always thought a prime swarm was a first swarm, and all of those coming later on from this same parent colony were after-swarms."

"You are correct in thinking that a prime swarm is a first swarm, for such is always the case; but that is not the question Dr. Miller raised, if I understand him correctly."

"Well, then, I do not understand Dr. Miller as well as I thought I did. What do you understand to be the question he raises?"

"He wishes to know why it is erroneous to call a *first* swarm a prime swarm. A prime swarm must of necessity be a first swarm, but that does not necessarily make

it that a first swarm must be a *prime* swarm."

"Well, what is the difference?"

"I think we can get at this matter by turning to the dictionary. All I have here at the office is the Student's Standard Dictionary by Funk & Wagnalls; and it is so brief in every thing I may not find what I want. Oh, yes! here it is. 'Prime. n. 1. . . 2. The period of full perfection in any thing.'"

"Very well. Is not the first swarm a perfect swarm?"

"No, not always."

"Please tell me wherein not."

"A first swarm, to be a prime swarm, must be in a normal or perfect condition, which is as follows: The parent colony must have an old or laying queen, generally reared the season before, or of longer standing, though this is not strictly necessary with a prime swarm. But it *is* necessary that this queen should have been laying long enough to fill the hive with brood, laid the eggs in the drone and queen-cells, while the younger bees are all of her own production. Then upon the sealing of the first queen-cell (in some cases before), this old or laying queen goes out with the bees when they swarm, so that they can establish a perfect colony in their new home at once. Here we have not only a first swarm, but a prime swarm as well, because in every way the whole thing is in accord with perfect or *normal* condition."

"But I never knew a first swarm to issue under any other conditions. Did you?"

"Oh, yes! Very many of them. And this is especially the case in very poor seasons. Two years ago I had only three swarms in both apiaries, and none of the three were prime swarms—that is, swarms like what we have just been talking about; yet all three were first swarms."

"Please explain."

"In each of these three hives, or colonies, the laying queen which was wintered over commenced laying the same as did all the others, and the bees had no more desire to swarm while these queens continued to lay than did any of the other ninety odd colonies; but just before the season arrived, when most colonies would have swarmed, had the season been good, from some reason or other these three queens died right at a time when the hive was well filled with brood and bees of all ages. The queen having died, the bees set about raising them another; and, not being content to start only one queen-cell, as is almost always the case, they started from four to a dozen, which queen-cells were perfected over the larvæ they had chosen for the purpose. Here you will see is quite a difference from the prime-swarm method. In the one case the bees and queen were all agreed in the matter, in order that a perfect swarm should go out, so she laid the eggs in the queen-cells for the queens, they being perfected from the egg, while in this latter case the bees took larvæ of their own choos-

ing and built queen-cells over them. You see the difference?"

"Yes, I see. But go on."

"When the first one of these emergency queens came out of her cell, there were several others just ready to come out, and the bees hesitated what to do till the first out began to pipe and the others to quawk, so finally concluded to send out a swarm to keep peace in the family, and soon out they came—a first swarm, to be sure; but was it a *prime* swarm, a perfect swarm, or a normal swarm?"

"From your line of reasoning, I shall be compelled to say no."

"No. It issued, to all intents and purposes, just the same as an after-swarm would, except that it had more bees, and the queens were what is called 'emergency' queens, instead of those reared where the queen laid the egg in the cell for them at the start. They had no laying queen, and the swarm must be queenless, so far as any egg-laying was concerned, till this young queen went out to meet the drone, and had eggs perfected, or from three to six or eight days; while the prime swarm had a queen ready to lay eggs in the first comb built, as soon as the cells were deep enough. I think Dr. Miller must have failed to comprehend, just at the moment he asked that question, that *prime* meant in a normal or truly perfect condition in every way."

THE outlook for the honey-crop in Arizona, up to March 10th, was very discouraging, according to one of our correspondents.

NEITHER comb nor extracted honey is moving off very freely, and this is particularly so of comb, a large part of which, if not all, could have been moved off had it not been for the comb-honey lies that have not yet been all choked off.

COMB-HONEY LIES BREAKING LOOSE AGAIN.

THE comb-honey lies are breaking out again in the Eastern papers. They first started out in Chicago, and moved southward and westward till they got to California. Then there was a gradual exodus eastward again. The Chicago papers had been so thoroughly bombarded and lambasted by bee-keepers that they probably will not rehash any more of the stuff. But in the mean time the Eastern papers began to pick up the old stories and rehash them. Among these papers is the *Philadelphia Record*, one of the very best and most influential papers in the East. Another one was the *New York Tribune*, one of the old standards. I suggest that our Eastern bee-

keepers send a few thousand letters. Pile them in so thick and fast that the editors of those papers will never again give space to such nonsense.

THE EFFECT OF WM. STAHL'S ADVICE REGARDING THE MATTER OF SPRAYING TREES WHILE IN BLOOM.

THE following letter, from one of our subscribers, a member of the National Bee-keepers' Association, shows the effect of Wm. Stahl's advice about spraying while in bloom:

Mr. Root:—I fear I am about to get my bees all poisoned. A neighbor within a quarter of a mile has an apple-orchard of 1000 trees. He bought of Wm. Stahl, of Quincy, Ill., a spraying outfit. Stahl advises spraying while in full bloom with Paris green. My neighbor says he is going to do it. You certainly know the result will be death to my bees. I sent \$1.00 to George W. York, as dues in the National Bee-keepers' Association more than one month ago, and have not heard from it yet. I also wrote to our member in Congress, and he turned my letter over to Frank Benton, who sent me his book on bee culture. Now, if you can help me to get bulletins from the experiment stations of the States that have laws against spraying fruit in bloom, I think I can convince my neighbors that Stahl's advice is all wrong. I am not an object of charity, but I am not in position to know whom to write to in order to get what I want. Will you please help me out? J. T. WILLIAMS.

P. S.—Apple-trees will be in full bloom here about April 15. J. T. W.
Noel, Mo., March 1.

There is no doubt that your dollar was received and forwarded on to the General Manager. The office has been vacant for a few weeks; but now it has been filled, some action looking to your relief will doubtless be taken.

Any amount of evidence has been placed before Mr. Stahl showing that his advice is hurtful, not only to bee-keepers but to the fruit-grower. But none are so blind as those who will not see. When a good many bee-keepers complained, he came out with a modified statement in one of his circulars, to the effect that the liquids he recommended were not strong enough to kill bees.

If there ever was a case that ought to come before the National Association, this is one; and I recommend that the Association, through its General Manager, employ the best legal talent it can get hold of to see if there can not be some redress against a man who, apparently at least, is purposely giving such advice. I for one should like to see the Association emptied of half its treasury in making this a test case. Remember, Stahl is one who has been giving a helping hand in the dissemination of the comb-honey canards.

In the mean time, those of our friends who have disagreeable neighbors who are following the advice of this man Stahl are requested to send to us at once for literature bearing on the subject. If the fruit-growers are persons who will listen to reasonable evidence presented by the experiment stations at Geneva and Ithaca, N. Y., or any other station in any State, they will for their own protection spray only before and after bloom. We are prepared to furnish leaflets on application, which will explain the matter very thoroughly.

Later.—There is another firm, the Field Force Pump Co., of Lockport, N. Y., manufacturers of spraying outfits, who have been sending out circulars recommending the spraying of trees while in bloom. We wrote a gentlemanly protest to these people, sending them facts from their two experiment stations, at Ithaca and Geneva. In reply they wrote back this courteous letter:

Gentlemen:—Our attention had already been called to the fact which you mention in your letter of March 18, and we have replied to our correspondent. We promised our former correspondent, however, that, as soon as there was a reprint of these leaflets, it would be changed to read "As soon as the blossoms fall." We are in full sympathy in your efforts to protect the bees, which are sometimes poisoned by the spray, and thank you for calling our attention again to this unintentional error on our part. Trusting that this will be satisfactory, we remain

Very truly yours,

Lockport, N. Y., Mar. 19. FIELD FORCE PUMP CO.

This firm is pursuing a very honorable course, and we are glad to recommend them to our bee-keeping friends, as they are large manufacturers. Mr. William Stahl would not lose any prestige if he were to make as manly a backdown as these people in Lockport have done.

Here is another letter that will speak for itself:

Friends:—I have lately received of Wm. Stahl, of Quincy, Ill., his catalog and instructions on spraying, in which he still advises to spray on full bloom, or at latest when first blossoms begin to pass. I had sent for his catalog in view of buying a pump. I promptly wrote him that since he would not heed our remonstrances, or mind our proofs of the non-necessity to do so, I could not think of dealing with him at all, no matter how well I might think of his pumps or quotations. I wish to suggest to you to advise the readers of GLEANINGS to again remonstrate with him.

Yours very kindly and for mutual protection.

Utica, Ill., March 1.

A. MOTTAZ.

WHY IT PAYS TO KEEP POSTED; PRICE CURRENT ON HONEY.

THE following paragraph, taken from an article by S. D. Graham, in the March issue of the *Bee-keepers' Review*, is something that bee-keepers can afford to read and ponder:

I sometimes think the readers of our bee-journals do not appreciate the real value they might get out of them. It is this knowledge, coupled with our experience, that has made us the bee-keepers we are; and it depends largely on us, not only how we handle the information we get out of them, but sometimes the value in dollars and cents. Not long ago I decided not to take any of our bee-journals, and I stopped all but GLEANINGS; and all that saved GLEANINGS was that I had it paid for a long time in advance. Near the close of the season I had an offer for a lot of honey, and I decided to write a letter accepting the offer the first time I went to town. GLEANINGS came, and in that copy it gave a report of the prospect for a honey crop in the different parts of the United States. It decided me to hold my honey for a short time. In 30 days I sold this lot of honey at 1/2 cent more a pound, and I also saved the freight on 8000 lbs. from my place to Grand Rapids. I think it would have paid for GLEANINGS 60 years.

Here is a case where the investment of one dollar for a bee journal paid back 6000 per cent. "Nuff said."

It will be a feature of GLEANINGS, as it has been in the past, to keep our readers posted in regard to the prospects and the probable ruling prices throughout the United States.

In our issue for Mar. 15 I spoke of the fact that there had been all the way from 9 to 20 inches of rain in California, depending on the locality, or at least enough to insure a honey crop in that State that produces annually from 200 up to 500 cars of honey—that is, when it produces any honey at all. If there is to be a fair crop of honey on our western coast, it is important that bee-keepers in the East, who have honey to sell, should find a market as soon as possible for any left-over crop they may have. To hold back the truth will do almost as much damage as to try to carry the other impression that there was no honey, and that prices ought to advance.

The inevitable law of supply and demand is bound to control, to a great extent, prices, providing we can plaster up the mouths of certain buyers who have an "ax to grind," that is, those who are anxious to depress prices in order that they may buy low. The exact and unvarnished truth should be placed before bee-keepers.

Suppose, for example, that we tried to give the impression that a nine-inch rain would not amount to much in California, and that bee-keepers need be in no hurry to dispose of their held-over crop. The result would be that they might hang on to the honey while it was dropping day by day, instead of letting it go at the then ruling prices.

HOW TO KEEP FOUL BROOD OUT OF AN APIARY WHEN THE DISEASE EXISTS ALL AROUND, AND AT THE SAME TIME PRODUCE FANCY COMB HONEY.

THE following letter will speak for itself:

Friend E. R. Root:—What do you think of the plan of combating foul brood as given in the January *Review*, shaking off the bees in an empty hive, thus making a new swarm, and destroying the old combs after the brood hatches? Would not the plan have to be modified somewhat to work well here, where the honey-flows are so short and uncertain?

Oberlin, O., Mar. 10.

CHALON FOWLS.

As our readers may not possibly be familiar with the item on page 23 of the *Bee-keeper's Review*, I have thought best to reproduce the editorial from the *Rocky Mountain Bee Journal* which the *Review* copies. It is as follows:

While foul brood wiped out many of the original apiarists of the State, it is not considered a serious menace by the intelligent "new blood" that has succeeded them. In the "locality" broadly included in the term Colorado (probably just as applicable to the entire Rocky Mountain region) the character of the honey-flow is such as to permit a system of management for comb honey that practically renders the apiary immune to the disease.

Some of our largest and best comb-honey producers have for years made a specialty of producing fancy honey. It is a well-known fact that section honey produced over new brood-combs will be cleaner and whiter than that produced over combs that are one year old, or older. In most localities there would be a big loss in having new brood-combs built every year. To one who has never tried it, such would seem to be the case in Colorado; but those who are practicing it assert that there is not only not any loss in the number of pounds of surplus honey produced, but an actual gain in the superior grading quality of the honey secured and the yield of wax from the old combs.

To secure new brood-combs each season and not lessen the crop of surplus honey, at the opening of the

honey-flow each colony is shaken into a new hive containing only foundation starters in the frames, but full sheets of foundation in the sections with a queen-excluding zinc between the first super and the brood-chamber. The bees will prefer the full sheets of foundation to the starters, and begin to work vigorously in the sections, building comb in the brood-chamber only just fast enough to accommodate the maternal capacity of the queen. By the close of our long honey season the brood-chamber will be filled, and the best possible work will have been secured in the sections.

To make a success of this system, colonies must be strong and the work must be done at exactly the right time. It may be said further in its favor that it effectually solves the problem of swarming.

The apiarist who practices this system may laugh at foul brood. It will matter little to him if his bees get a chance now and then to rob a dead colony in some obscure back yard that the bee-inspector's vigilant eye has missed. He will shake them off the infected combs about the time the disease would begin to show, and that would settle it for that season.

In the light of the latest and best knowledge of the subject, foul brood has lost its terror to the man who reads, thinks, and investigates. Its cure is simple and certain, and even comparative immunity from it may be had by following this system of building new brood-combs every season.

Now, then, we are in position to answer Mr. Fowl's question. The plan proposed by the editor of the *Rocky Mountain Bee Journal* is eminently practical, especially in the Rocky Mountain regions, where there is a great abundance of alfalfa. Whether one could afford in the East to melt up good combs every season is an open question. But I do know this: That our friend H. R. Boardman, of East Townsend, Ohio, one of the most progressive bee-keepers in the United States, has practiced a plan quite similar to it for years; and the last conversation I had with him was to the effect that he considered the plan profitable in the production of comb honey. His plan, however, is to cut the combs out, leaving only a narrow margin as a sort of comb-guide to build over again.

In the summer of 1886 foul brood broke out in our apiary, and the disease hung to us with more or less virulence for two seasons. At the end of the third year we had gotten it under control, but for four or five years there would be here and there a colony that showed symptoms of the old malady. In every case we traced the infection to some old combs which we supposed were all right.

In later years we have made it a practice to melt up all old combs and use nothing but those that were comparatively new. Since that time all vestiges of the disease have disappeared. So far I believe the plan recommended by the editor of the *Rocky Mountain Bee Journal* is the only way by which an apiary can be entirely cleaned of the last trace of the infection. I have talked with those who have had foul brood in their apiaries; and, while they could get it under control, they could never be quite sure that they did not have a colony in the yard that had the disease.

In view of the grave problems presented by foul brood in certain localities, and in view of the possibility—yes, even probability—that combs can be profitably cut out once in two or three years, it may be well for bee-keepers in disease-infested localities

to try the plan of producing comb honey recommended by the editor of the *Rocky Mountain Bee Journal*. I am sure of one thing—that it absolutely removes the last trace of foul brood; and, even if the practice is not as profitable for the production of comb honey as the old way of keeping the old combs, one will accomplish at least this much: He will free his apiary from foul brood, or at least keep it in reasonable health, even if the disease lurks in every apiary around his own.

GENERAL MANAGER ABBOTT.

AT the last general election of the National Bee-keepers' Association, General Manager Secor stated he was not a candidate, and desired to be relieved on account of other interests that would be taking up his time; but in spite of this statement he was re-elected. Still feeling that he could not fill the office he sent in his resignation to the Executive Board. According to the recent amendments of the constitution in the matter of selecting a new General Manager, this duty devolved on the new Board of Directors. The matter was formally presented to them, and the result is that one of the Directors, Mr. E. T. Abbott, chairman of the Board, was selected as General Manager to fill out the unexpired term of Hon. Eugene Secor. Mr. Abbott promptly handed in his resignation as chairman of Board, and the Directors are now considering his successor.

One of Mr. Abbott's marked characteristics is his strenuous aggressiveness. Perhaps the fur may fly. If it does, it will be in the defense of the rights of bee-keepers.

CENSUS REPORT ON BEE CULTURE.

THIS report has finally been issued, and one press report is as follows:

WASHINGTON, Mar. 21.—The census bureau issued a complete report to-day showing that for the country as a whole on June 1, 1900, there were 707,261 farms keeping bees. These farms reported 4,109,626 colonies, valued at \$10,186,513. During the year 1899 there were produced 61,196,160 pounds of honey and 1,765,315 pounds of wax of an aggregate value of \$6,664,904. Of the States reporting honey, Texas is first, California second, and New York third, reporting 3,422,497 pounds. The counties showing the heaviest production are Fresno, San Diego, and Tulare, in California; and Tompkins, Cayuga, and Seneca, in New York.

This is much more accurate than some statistics the government prepared some years ago. The number of farms keeping bees is probably nearer correct. The number of colonies is too low. The amount of honey produced is just about half what it should be. The trouble is, statistics are not gathered systematically in some States. Among the States that produced the largest amount of honey, California should by all odds rank first. Texas might come in as a second. The report from New York is probably correct; so also the report of the counties.

MORE rains have fallen in California, and the faces of the bee-keepers there are wearing broader smiles than ever.

SUGAR FOR BEES.

Cane and Beet Sugar; Sugar for Canning Purposes; Refined and Unrefined Sugars.

BY W. K. MORRISON.

Some of your readers are apparently not yet ready to admit that cane sugar is the best for bees that have to be fed, and M. R. Gilmore undertakes to defend beet sugar without offering the slightest evidence in rebuttal, or without even noticing the purport of my article.

I am well aware that scientific men class beet, cane, and milk sugar together, the last mentioned being closely related to the others, chemically speaking, though differing very much in taste. He is afraid that I do not know what saccharine is. Oh! I do; but I have seen it suggested very much as a food for humans, and at least one bee-journal suggested using it for bees, and no doubt it is pure—that is, it is a pure chemical. Cane sugar, according to the chemists, is embraced in the chemical formula $C_{12}H_{22}O_{11}$. But this does not embrace our commercial sugars, as will be readily seen by reading my last article on this subject.

The grocer who was fined so very heavily by a high English court for selling dyed beet sugar made the very same plea that Mr. Gilmore makes, which is that sugar is sugar; but the learned judge very properly declined to entertain this sort of argument, and decided, in a common-sense way, that beet sugar is not cane sugar.

As a matter of fact, there are many sorts of cane sugar imported into the United States, it would be hard to state how many. The sugar trust, of course, tries its best to make them all alike; but Mr. Gilmore ought to read the Dingley tariff bill, and see how that genial old gentleman, Uncle Sam, manages to arrange a different rate of duty for each sort. Why? In the West Indies and South America some cane sugar will show 20 per cent grape sugar, which is a very good food for bees. I will send by this mail samples of different kinds of sugar for the editor to examine, and compare with beet sugar. No doubt he will pass an unbiased opinion, and say whether I am right or not. But it would be rather queer if he decided against me.

If Mr. Gilmore is a man of science he should know that sugar with a large percentage of ash is good for producing bone, chitine, and horn; and he should also know that grape sugar, or levulose, is good for bees—at least he ought to know the theory of it, and the bulk of scientific opinion is with me on this point. Further, European

bee-keepers who are experts on this subject agree in stating that the kind of sugar I recommend is the best for feeding bees; and Mr. Gilmore need not fall into a common error in supposing there are no scientific men among bee-keepers, more especially in Europe. In my opinion the American bee-keepers would use no other than the kind of sugar I suggested, only it all goes into the very capacious maws of the sugar-trust. He ought to taste some of this rich honey-like sugar before it is chemicalized and bleached to suit the American market. In the process it loses some of its most desirable characteristics. The Californians are not mistaken in using it for their fruit. They have long used it, and built up a reputation on it. Beet is often used to give a contrary effect to what the Californians want, which shows the latter are right in their practice.

In my article I gave an analysis of a sugar that has proved in the hands of European bee-men to be a good bee-feed; and unless Mr. Gilmore is prepared to produce a similar article, or better, he should cease his otherwise well-meant criticisms.

In writing my article I did not feel called upon to write a dissertation on the chemistry of sugar. The readers of GLEANINGS are mostly practical men who would not appreciate such an article. For my part I object most strenuously to chemical sugar, just as I object to what the chemists call pure water. I should hate also to see maple sugar converted into the pure cane sugar of the chemists, and I doubt very much if any one would buy it to eat; and for similar reasons it is not well to convert cane sugar, healthful and pleasant as it is, into a chemical sugar. Mr. A. I. Root says we should use none but pure sugar. This is unkind. I never suggested the use of impure sugar.

Mr. Huber Root comes nearer the truth; but the sugar I mentioned does not show the same analysis as beet sugar, hence his arguments fail; and it seems odd that none of my critics seem to pay the slightest attention to the analysis of the sugar recommended. *The whole disputation hinges on that.*

This question contains the very kernel of the bee-keeping business; for if we once admit this sort of argument, that all sugars are alike, the next step would be easy—namely, "honey is glucose;" in fact, this is the conception that is common among chemists, and which gives rise to the opinion that many of them entertain that it would be easy to make honey by synthesis. No one is more willing than I to admit the great value of chemical science; but for practical men chemical theory is wholly uncalled for in the pages of a journal like this. I can only assure your readers that there are many kinds of cane sugar. If they find any difficulty in getting samples of them, I am ready to assist them through The A. I. Root Co.

Oct. 17.

[Mr. Gilmore, to whom the foregoing was sent, replies:]

I have not now at hand the first article by W. K. Morrison on the subject of beet and cane sugar, so I do not now well recall his points; but it seems to me that his main controversy was that cane sugar is better and sweeter than beet sugar; while I said and still maintain that there is no difference between the two when they are refined. Of course, there is a difference in the unrefined, just to the extent of the differences in the non-sugars or impurities contained in the product. These impurities may be of such a nature as to impart a pleasant and desirable flavor, as in the case of maple sugar, sorghum sugar, and most sugar from cane, though I have seen samples of sugar from cane which had a rank, disagreeable odor also. On the other hand, these impurities may be of a nature such as to give an acrid and unpleasant flavor, as in the case of sugar made from beets; but removing these impurities, or refining, leaves no difference in taste or quality.

But I should not have expected an apiarist to advocate the feeding of any thing but that form of food which would be as nearly as possible entirely assimilable, leaving as little as possible of residue for excretion. Certainly I think that nothing but the purest sugar obtainable would be wise to use for winter feeding in our northern climate, where the bees can not fly for many weeks together. I believe that Mr. Root and all our leading apiarists will agree with me in this.

I have tasted some of the "rich, honey-like" South-American sugar before it is—I do not say "chemicalized"—but refined, and I do not say it is not pleasant to the taste. I will say that I like the flavor of the cane, so do I like the flavor of sorghum; but that is not saying that either one would be so good a food for bees; in fact, I think practical bee-men will say that the substances which give these flavors are detrimental to their usefulness as food for bees except at a season when they can fly freely. I do not understand what neighbor Morrison means by speaking of converting cane sugar into a "chemical sugar." If he means the process of refining, then I can not allow that the sugar is "converted" or changed, but only that the non-sugars or impurities are eliminated.

I think it is hardly fair for neighbor Morrison to class me in the same category with "the grocer who was fined so very heavily by a high English court." I do not agree that that grocer and I make the same plea. The grocer was simply making a false pretense, obtaining money thereby, so perpetrating fraud. This is nothing different in principle from the making of imitation maple syrup from cane sugar by means of corn-cobs, or the making of "extracted honey" from glucose.

Further, I think it would be folly for me if I supposed "there are no scientific men

among bee-keepers" to address in a scientific manner a body of bee-keeping readers. Quite on the contrary, I regard bee-keepers as a class of more than average intelligence and scientific reading.

If, as would seem from the tenor of the second article, neighbor Morrison is contending for the superior quality and sweetness of unrefined cane sugar over unrefined sugar from beets, then I have nothing to say against it; but since, when one speaks of sugar, pure sugar, that is, refined sugar, is meant and understood, I very naturally thought from his first article that he meant to contend that there is a specific difference between sugar from cane and sugar from beets, a notion which I have found to be quite commonly though incorrectly held, by reason of ignorance in regard to the composition of sugar, and, indeed, to the whole matter of sugar, as to production, processes of manufacture, sources, distribution, consumption, etc. This question was very frequently brought up by visitors to the sugar exhibits at the Pan-American Exposition, and was answered by the cane-sugar experts exactly the same as it was by me. Mr. R. Glenk, chemist of the Audubon Park Sugar Experiment Station, Audubon Park, Louisiana, who was in charge of the Louisiana State Exhibit, was in perfect accord with my views. But, if neighbor Morrison is arguing simply in regard to unrefined sugars—why, he and I are also in perfect agreement, hence no call for a second article from either of us. And yet he says, "Mr. A. I. Root says we should use none but pure sugar. This is unkind. I never suggested the use of impure sugar." But what is pure sugar if not pure sugar? Certainly a mixture, though a natural one, of twenty per cent grape sugar, a certain per cent of mineral salts, and a certain per cent of cane sugar, is not pure sugar, though it be purely a product of cane, any more than a certain per cent of mineral salts naturally combined with a certain per cent of cane sugar would be pure sugar, though purely a product of the beet. I certainly should not call this latter a pure sugar, and I think no one else would.

Valley, Neb. MELVIN R. GILMORE.

[Mr. Morrison replies:]

Mr. Root:—"The proof of the pudding is in the eating." Mr. Gilmore and I must agree to disagree. He is talking about sugar as a chemist, not as an epicure nor a bee-keeper. In Europe, the land of beet sugar, the bee-keepers have long since decided to use cane sugar—not what a chemist calls cane sugar, but the real simon-pure article, extracted from the cane-plant. It is a pure sugar from the consumer's point of view, and is good enough for the tables of the richest in the land. It commands the highest market price, and is preferred by epicures who put flavor before appearance. From the experiments of Dr. Planta, a great chemist, as well as many other less distinguished, it has been proved that

a highly refined chemically pure sugar is not good for bees; and when we recollect that honey is quite a different thing entirely it follows that the bees are compelled to digest what their internal organs are not adapted for. We know that, after passing through the organs of the bee, common sugar is partially converted into glucose. If extracted and fed again, it is still further converted into glucose, and the process may be continued till it is all converted into glucose. Such a process is a great strain on the bees, and we bee-keepers should try to avoid this by using the best sugar possible for the purpose. The presence of albuminoids, amides, gums, salts, etc., all conduces to the health of the bees, showing that their constitution somewhat resembles humans in its rebelling against chemically pure foods. And while honey is set down by chemists as glucose, and nothing else, it is not so in actual practice. A good many kinds of honey contain cane sugar in small quantities, also albuminoids, gums, oils, wax, amides, salts, etc., so that there is a great difference between glucose and honey, though both are alike according to the chemists. We may be allowed to paraphrase the saying of Pontius Pilate with regard to truth, and ask, "What is honey?" and, going a step further, say, "What is sugar?" Here let me say again that that English grocer made the very same plea that Mr. Gilmore makes; namely, that beet sugar is cane sugar, and so it is—to a chemist.

What little I know about chemical science I owe to one of the great Meyer family, of Germany—surely a name to conjure by, Mr. Gilmore will admit; and I believe, from what he taught me, we are still far from understanding the sugar question.

Prof. Armsby hits it off far better than I can do, in his "Manual of Cattle-feeding," page 44, where he states, in speaking of the sugars: "They all resemble in a general way cane sugar in their properties, though they are *by no means identical*." (The italics mine.) Surely my opponent will admit that Mr. Armsby is a very high authority, more particularly as he is following in the footsteps of a very great German authority, Mr. Wolff. Following the same authority, and also that of Prof. Henry, in his "Feeds and Feeding," Mr. Gilmore will find that the presence of extraneous matter in food is a help to digestion. One that is familiar to many is that of Graham versus fine bolted flour. Another instance that is familiar to cattle-feeders is that of corn meal versus corn and cob meal. Both are equal as regards feeding value, though the corn and cob meal is much inferior, chemically speaking.

I know there are some who believe that the future man will live on pure concentrated extracts and the like, but they haven't a leg to stand on. Persons who try that sort of thing get dyspepsia, and so do bees. Nature rebels against it.

When living on the eastern shore of Maryland I worked for three different canning-

factories, and none of the three or any others there would use beet sugar with their fruit for canning, and it seems to me this is a rule everywhere. It is so in condensed-milk factories. The manager of the New York Condensed Milk Co. (Gail Borden), an old friend of mine, told me that his company would use only the best cane sugar. They never would use beet sugar. It is the same in Europe, where beet sugar is king. They won't use it in milk. This is what Fleischmann, the very highest authority in the world on milk, has to say: "The experience which has been acquired up till the present time in the preparation of condensed milk points to the fact that the fresh milk should be previously warmed with 12 to 13 per cent of cane sugar—*beet sugar has proved itself unsuitable.*" The italics are mine. Coming from one of Germany's most celebrated scientists, from a country where beet sugar this is supreme, is very important testimony; and from Germany, Switzerland, France, and Great Britain, beet-sugar-consuming countries, has come nearly all the testimony that beet sugar *has proved itself unsuitable as a bee food.* Nay, more; the bee-keepers of Europe look to the West Indies and the East for their sugar supply, using it just as it is sent. It is not "raw" sugar, as Mr. Gilmore supposes. I am so isolated that I am obliged to rely wholly on my own library for references, but I think I have done enough, and rest my case, as the lawyers say. W. K. MORRISON.

[After I had received the articles from the two gentlemen referred to, one came from J. M. Rankin, of the Michigan Experiment Station, who had not seen any of the articles except Mr. Morrison's first one, leading up to this discussion. He seems to support the opinion of Mr. Gilmore, the beet-sugar expert at the Pan-American exposition. Mr. Rankin writes:]

BEE-T VS. CANE SUGAR AS A BEE-FOOD.

It seems a useless waste of space to discuss beet and cane sugar at this late date.

"If it were done when 't is done,
Then 't were well if it were done quickly;"

that is, if writing this article would convince our skeptical brethren then I would feel that I was really doing a lasting good to the bee-keeping public. Many able articles have preceded this one on the subject, and the chemical side of the question has been discussed in a former issue of this journal so much more ably than I could possibly handle it that I will refrain from touching the chemical side of the question, and will give the reader an account of some actual experiments along this line.

Early in the history of the Michigan Sugar Co., whose factory is located at Bay City, and was the first factory built in Michigan, the chemist of our Experiment Station requested me to test the product of this factory as a bee-feed. I wrote to the Michigan company, and procured a sack of 100 pounds of what I knew to be beet sugar. It came direct from the factory, and in a

sack on which was printed the trademark of the Michigan Sugar Company. (I send herewith a sample of this same sack of sugar to the editor.)

October 10, 1899, the brood-chambers of five colonies of bees in the apiary of the Experiment Station were extracted clean, and syrup made from this beet sugar was fed. October 15, five days later, five more colonies were extracted clean, and fed on syrup made from sugar that was known to be the product of sugar cane. No honey was gathered after this date, and the ten colonies under experiment went into winter quarters as nearly of equal strength as it would have been possible to select them. The bees were wintered on summer stands, packed in chaff. All ten colonies came through the winter in prime condition, and no preference could be noticed for either feed. In fact, I thought not enough of the experiment to publish it in full, as there seemed to be no case against the beet sugar, and I had no idea that such a dispute would ever come up as has taken place in the journals within the last year. I merely mentioned, in the Report of the State Board of Agriculture of Michigan for 1900, page 91, that such an experiment had been carried out.

The following year some beet sugar was offered for sale that had about it a peculiar odor. It looked like any other sugar; but when kept sealed in a glass jar for a few weeks, upon opening the jar an odor was detected. Syrups were made from this sugar, and placed in open dishes in the tops of some four or five colonies of bees. Each dish was placed beside a dish of cane-sugar syrup. The dishes were all exactly alike, and in each was placed one pound of the mixture. In every case the bees emptied the dish containing the syrup made from the sugar with the odor before scarcely beginning on the dishes containing the cane sugar. Two colonies were wintered on this sugar, and came through the winter in perfect condition.

What is beet sugar? Is it some new product of the last few years which was entirely unknown before? Let me quote a few statistics from A. Boucherau's Statement of Sugar Crop. The following shows the percentage of cane sugar that has gone to make up the world's sugar supply:

1865	69.8 per cent.	1885.....	51.2 per cent.
1870	62.9 "	1890.....	45.0 "
1875	54.3 "	1895.....	40.7 "
1888.....	52.2 "	1900.....	35.6 "

Does it seem reasonable—(I leave it to the reader) to think that, during all these years, we have been using cane sugar entirely? It will be noticed by examining the above table that, since 1875, nearly half the sugar consumed in the world was made from beets.

In conclusion, let me quote from a man whose name is dear to every farmer in Michigan, and honored by the college men the world over—Dr. R. C. Kedzie, the veteran Experiment Station Chemist of America.

He said, when asked what the difference between beet and cane sugar was, "There is only one answer to this question; cane sugar and beet sugar are the same. It is not a question of similarity, but of identity. Chemists, the world over, are agreed as to the identity of cane and beet sugar, and all statements of differences and properties—of inferiority or superiority of these sugars—are either in ignorance or for deception. We sometimes say, 'As like as two peas;' but no two peas are exactly alike; such comparison does not hold on this subject, for it is not a question of likeness but identity.

"The suspicion was aroused by the sugar trust that beet sugar is inferior to cane sugar, and this suspicion has been carefully nourished by the sugar trust; and the statement has been so often repeated that many folks have believed it. What are the facts? For the last three years the people of the Northern States have used beet sugar almost exclusively. Look at the world's sugar production in 1898. We were at war with Spain, and little sugar was produced in Cuba and Porto Rico, and less still was exported. None was obtained from the Philippine Islands; the sugar from the Sandwich Islands was required for our people on the Pacific coast; Louisiana could not make enough sugar to supply herself and the Gulf States. Where could we get enough sugar to supply the millions of tons required for the world's consumption if we depended on sugar from the cane alone? The supply of sugar from sugar cane has been insufficient to fill and replenish the world's sugar-bowl, and for three years past we have been in a large measure cut off from that source. If it had not been for the beet sugar of Europe the world would have gone hungry. Beet sugar at this very time furnishes two-thirds of the world's supply. The supply of refined sugar for our own use for three years past has consisted very largely of beet sugar from Germany and France." J. M. RANKIN.

[I have read this discussion thus far very carefully, and I do not see that there is very much disagreement between our correspondents except as to the suitability of unrefined sugars for bees. Mr. Morrison argues in favor of the rich honey-like sugar before it is chemicalized and bleached to suit the American market, and there is no question but such sugar does have more flavor than the refined sugars of either beet or cane. Personally, on my own puddings and pastry I prefer them to the refined article. While there can be no question that many honey-like sugars have more flavor, I believe there is a question as to whether such sugars are as healthful for bees.

Many years ago A. I. Root conducted a long series of experiments, feeding the brown sugars, coffee A sugars, and granulated sugars, all from the sugar cane, because at that time there were no beet sugars on the market. He came to the conclusion

that the white or refined sugars were not only cheaper but more wholesome for the bees, for northern climates like ours. The dark sugars had a tendency to bring on dysentery. Other bee-keepers have since verified A. I. Root's experiments; and throughout the United States, at least, granulated sugar only is used when made into syrup for feeding bees for winter.

Mr. Morrison also writes as though honey were more wholesome than sugar syrup. He says, moreover, that syrup fed to bees is partly converted into glucose. Chemically speaking I suppose that is true, although we have said of late that either nectar from flowers or sugar syrup is "inverted" in the organs of the bees, or, as Prof. Cook puts it, "digested." If I am correct, nectar is a cane sugar—that is, a chemical cane sugar; so also is granulated sugar which we feed to the bees. Either one goes through a chemical change in the organism of the bee; but the nectar of flowers, being almost as thin as water, is, as a rule, more thoroughly digested, or inverted, and may, therefore, be more easily assimilated. It has been the practice of late to feed all sugar syrup thin—much thinner than recommended years ago, for the purpose of securing much more thorough inversion of the syrup before it goes into the combs.

Some years ago, I think it was Mr. Jas. Heddon (and his testimony was supplemented by a numbers) who argued in favor of sugar syrup rather than honey as a winter food; and, as a rule, I believe bee-keepers, at the same price, have preferred granulated-sugar syrup because it was free from deleterious flavors and substances that have a tendency to clog the intestines of the bees.

I believe it is true that, in England, and perhaps throughout Europe generally, cane sugars have the preference over beet sugars as a bee food; but this preference, I have been told, is based on the theory or fact that an unrefined *cane* sugar is more wholesome than an unrefined *beet*. Whether or not there is any thing in this, I do not know. I believe it is also true that some canning-factories have at least a preference for sugar from the cane. Whether that preference is based on an erroneous notion or not, I can not say.

I do not believe it is wise or best to continue this discussion any further; for when doctors disagree, who shall decide?—ED.]

J. D. C., N. C.—I do not think there will be any difficulty about your moving your bees any time, providing the weather is warm enough to permit them to fly at the time you move them. You should make some arrangement to see that the combs are securely fastened in the hive, and the bees have plenty of ventilation. Wire cloth should be put over the entrance, and wire cloth or thin muslin over the tops of the hives. In moving bees it is necessary to give a large amount of ventilation. Wire cloth at the entrance only would not answer.

RAMBLE 199.

Troubles with a New Language; Mr. Brown, of Tulipan; Glimpses of Life in the Tropics.

BY RAMBLER.

When a lone traveler from the States drops into a city like Havana there is another peculiarity that strikes him with considerable force. His tongue does not fit at all with nine-tenths of the tongues he meets. When several full-grown men are in turn asked a civil question in English, and they stare at you, and repeat a jargon of words you do not understand, with many motions of the hands, and so rapid as to sound about like hail pattering on a tin roof, you begin to realize what a wretched time the confusion of tongues caused at the tower of Babel. But I did not worry a bit. I rather enjoyed the situation. It was something new and novel. As a natural outcome from such a condition the traveler will seek his own, or, in other words, "birds of a feather will flock together," and I was temporarily quartered at Hotel Thrower, where patrons are all Americans, and can speak a civilized language. I was not slow to talk about honey matters, and had not talked far with Mr. Thrower before he remarked, "If you are a honey-man you must see Mr. Brown, of Tulipan," and he gave me directions to find him in the suburbs of the city. A short time after, I was talking with Mrs. Thrower, and she "threw" the same advice to me: "You must see Mr. Brown, the great bee-man at Tulipan. Why," said she, with enthusiasm, "we had a delightful basket picnic there last Fourth of July. A great affair it was too—honey all we could eat; speeches, flowers, and the hum of the bees under the palm-trees."

Dr. James Warner, an American, is a bee-keeper of note as well as a popular and successful dentist of many years' standing in this city. While spending a very pleasant evening with him he also propounded the question, "Have you seen Mr. Brown, of Tulipan?"

Mrs. Warner also, soon after, entered the room, and in the course of conversation said, "You must see Mr. Brown, of Tulipan."

Then there is the Rev. Mr. Herrick of the Congregational mission in Havana, heroically hoeing his row, digging up tares of

rank growth. We had not conversed long before the advice came, "You must see Mr. Brown, of Tulipan." His son and then his wife were introduced to me, and it was again, "You must see Mr. Brown, of Tulipan."

I was attracted to a restaurant because it bore in large letters, "California Restaurant." Charley Chinaman, a round-faced jolly fellow, was manager. We swapped ideas about California; and when I mentioned honey matters he remarked, "Oh, l'yes! honey, honey; l'you kl'now Mr. Blown, of Tluliplan? Oh! ha—l'you must see Mr. Blown; him gleet blee-man—ha-ha."

Certainly I wanted to see Mr. Brown; and when the opportunity came for me to go to Tulipan I had forgotten my directions; and, though on the Prado, where hundreds of people were passing, I knew I should have to ask many before getting the infor-

"SHE WALTZED UP IN FRONT OF ME."

mation. While I was revolving these matters a gentleman stepped up to me and remarked, pointing to a street-car, "That is a Cerro car."

"So I observe," said I; "but I want to go to Tulipan."

"Oh! it is Tulipan, hey? Why, you must be seeking Mr. Brown, the bee-man;" and he gave me full directions for getting there.

And you will excuse me if I began to think things were coming my way quite fast when an utter stranger should step up to me and give me the desired information at the desired moment.

Tulipan is a close-in suburb of Havana, and near the end of my journey I was following a stone canal. Approaching was a tall angular negress, and cutting up such antics trying to dance a jig upon the edge of the canal. We met; and, instead of passing me civilly, she waltzed up in front of me with her long uncanny fingers elevated, and her bleared eyes and ugly mouth within three inches of my face; and such a savage expression and flow of words—abuse or compliments it was all the same to me. I stood my ground, looked her in the eye, and shouted, "Senor Brown! colmenero Brown!" and such a magic effect as the

name "Brown" had upon that witch you can not imagine. She just faded away, and slouched off up the canal without another word.

Well, I found Mr. Brown camping in tents with his bees—about 120 colonies—under the mangoes and palms. Mr. Brown and I were soon acquainted. He has lived in many portions of the States, and is well posted upon all topics of the day, and has taken to bee-keeping very recently in Cuba.

There is an old adage that, "if you give the persistent seeker after knowledge the handle, he will pump you dry." I found Mr. Brown somewhat inclined that way, and I have no doubt his pleasant talkative qualities are the reason of his being so well known and popular with the American colony in Havana. His apiary was imported from the States—one portion of it from Missouri and another from Vermont. The Missouri contingent was started by Mr. Cully, of Higginsville. Mr. Cully being accidentally killed on the way, the bees, after many delays, arrived in Cuba 21 days after shipment, half of them dead, and the rest in a weak condition. The Vermont bees came through in a week, all alive, at an expense of about \$2.00 per colony; and, though Mr. Brown's bees have cost him about \$10 per

MR. BROWN'S APIARY IN CUBA

colony, he concludes that, if the shipment is not delayed, bees can be shipped here profitably from Texas and all States east of the Mississippi River. Bees, however, can be so rapidly increased here that it is better to buy than to run the risk of shipping. I will tell you later how it can be done economically.

Owing to the aforesaid propensity to seek information, Mr. Brown secured a great variety of it from the many bee-keepers he interviewed, and some quite contradictory. We all want to get on fast, and so does Mr. Brown; and this desire led him to push his insertion of sheets of foundation too fast, putting two frames where the condition of the brood-chamber would barely warrant one.

Mr. Brown is a close reader of bee literature, but could find nothing conclusive upon that point, and he remarked that he did not see why the A B C of Bee Culture couldn't tell just how, when, and how fast to insert foundation into a colony weak or strong; and that is a point, Mr. Editor, for you to look to in the next revision of the A B C.

I herewith present photos of Mr. Brown's pleasant location. The hives are nicely shaded under the mango-trees. This tree blooms twice during the year, and the bees work with energy upon it. I am told that the fruit of this tree is delicious, but it is so tender that it will not bear shipment. In this respect it is like many varieties of fruit on this island.

In this photo you get your first glimpse of the royal palm as far as my rambles are concerned. It is indeed a noble tree; and this, too, has a honey-producing blossom. The palm is a useful tree in many other respects, as I will show you later.

That Mr. Brown is a sociable man is shown in the next photo. His neighbors, great and small, Americans and Cubans, are all in the picture. Mr. B. is the center figure, with a wheel in front of him. Another notable figure leaning against the tent corner is Hilar D. Davis, of Vermont, of whom more anon. Then there is a Cuban mounted rural guard. We meet them on every road—a natty uniform, machete, revolver, and a carbine. He is a sort of useless arsenal, but it is dear to the heart of the Cuban to bear the insignia of office.

Mr. Brown uses the tent in the foreground for extracting honey, where we find a two-frame extractor. He is quite proud of his uncapping-tank—uses a barrel with a wire-cloth strainer about ten inches from the bottom.

At present, Feb. 7, Mr. Brown is happy from the fact that his bees have recovered from their setback, and are enabling him to fill his barrels with honey. One colony gave him 90 lbs. at one extracting. Mr. B. is a good salesman, and retails quite a little honey in Havana. He has worked up quite a market for honey in brood-frames. When he finds a super with one or more combs newly drawn from foundation, nice-

ly sealed and white, he calls that a "seller," and sells it for one peso (dollar).

May the shadow of Mr. Brown never grow less.

NOTES OF TRAVEL.

The Colorado Desert; the Old Seabed; the Economic Value of Deserts; Southern California; Frank McNay.

BY E. R. ROOT.

On leaving for Los Angeles I took the Southern Pacific at Maricopa. I had read a good deal about the Colorado Desert in Southeastern California; of the fact that my route was to be over the hottest place in the United States; and I was anxious to see for myself, and now I was to have that long-cherished hope gratified, and I did. I remember distinctly when we got into the desert country how I suffered from the heat, dirt, and sand, and well do I recall the wierd sensations that came to me as I got into the old seabed on this side of Salton—a basin or bowl *300 feet below the level of the sea*, perhaps 25 miles long and about 5 miles wide. I had a very strong field-glass, one of the Treider binoculars, and with this I took in the country far and near. As we reached the edge of the celebrated basin I began to see the mirage. To all appearances we were making toward the shores of a beautiful lake or sea, instead of going down, down, into one of the most desert portions in all the United States. Steam was shut off the engine, and gradually we moved down into this valley of death and stillness, where nothing can exist for any length of time, not even the salt grass. Occasionally, I am told, there are tracks of animals going across the desert, but they were in straight lines, because they know there is nothing in that waste for them. The ground is parched and broken into great gaps, and it seemed almost as if Mother Earth were yawning to receive us. Some parts of the basin are as level and hard as a granite floor. Other parts glisten with sand that is finer than snow. As we descended into the very bottom of this immense bowl, we appeared to be, not in a depression, but on the summit of a knoll; and when we looked in every direction it appeared as if we were on an island, and looking down toward inviting shores. I pulled out my glass and tried to discern more clearly this mysterious water with its ever-vanishing fleeting shore-line that so deceives the traveler. By looking very carefully I could see what seemed to be a sort of fog that was perfectly level on top; but so far as any water or moisture was concerned, I believe there is nothing of the kind—a sort of mysterious something due to the reflection on the sand, and the immense heat. I was told that, if I could get out of the car and lie with my head to the ground, this mirage would appear close enough to throw a stone into the water.

But the temperature! I never suffered from the heat in all my life as I did in that desert bowl. The passengers seemed to consider comfort beyond conventional decorum. We pulled off our coats and vests, and still the heat was insufferable, and the sweat oozed from every pore—not the profuse perspiration that we experience in damp countries, but a very slight thin moisture all over the surface of the body. On we sped until we reached Salton, a veritable oasis—indeed, a little town on the west edge of the basin, and where, it seemed to me, there was no chance for any population to exist. But here is, nevertheless, quite a respectable town, and all because of water which is obtained from the mountain-sides.

But before we go further on the trip let us make some observations about the desert out of which we have just come. This bowl, or seabed, which is 300 feet below the level of the sea, was originally, according to geologists, a part of the sea, and probably had direct connection with the Gulf of California. It appears that the Colorado River has queer freaks, and every once in a while it overflows its banks, and sometimes the entire country. In one of these freaks it is supposed it changed its course, flooded the country, closed up the old outlet by carrying sands and silts, and shutting off the connection to the Pacific itself, leaving an inland body of water. As the water was very shallow, the intense heat evaporated it, leaving a great many little basins here and there. But the largest and most wonderful one of all is this one of the Salton seabed. Travelers tell us that the old shore-line is very clearly defined; that there are evidences that the Indians once lived on these shores, that there are crude relics of their handiwork scattered all along.

In this Salton bed nothing will grow. Wood will not rot; iron will not rust; a carcass will not decay. Every thing is parched by the sun. I have seen no estimate or figures as to what the temperature may be out in the open; but I will guarantee it is hot enough to fry eggs up to the queen's taste.

I learn that a gigantic enterprise is now on foot to reclaim the Colorado Desert (of which this old seabed is a small part) in Southeastern California. It is proposed to divert the Colorado River into its old bed and make a large area, of about 100 or 150 miles square, into a garden of Eden, or like the other portions of California where tropical fruits are grown. But a note of warning is sounded by some who have given this matter no little attention. It is argued that these deserts in and about California serve a very useful purpose in giving the necessary heat to those localities that are now under cultivation. The sun's rays pour down on these desert sands with relentless fury. The heat is thus stored up in Mother Earth. The wind wafts it over the mountains into the valleys that are un-

der cultivation. The contention is that, if the Colorado River is changed back to its old bed and the Colorado Desert is converted over into fertile plains, growing all kinds of fruits and grains, then this immense furnace or storage battery of heat will fail to give off its supply of dry hot air so needful to the growing districts of other parts of Southern California.

There is no doubt at all that the all-wise Creator has arranged the mountains and the deserts, the lakes and the seas, just where it is best. Man had better not, perhaps, go too far with his irrigation schemes, else he may kill the goose that lays the golden egg. But we will not moralize on this question. No human being, at least, can tell what the result will be. Some authorities seem to think that man will not be able to carry out this great scheme; that Nature, having a plan of her own, will thwart his efforts. We shall see.

FRANK M'NAY AT HOME.

We now leave Salton, with its great heat, and pass onward into the higher lands between the mountains. We realize, by the puffing and snorting of the locomotive, that we are climbing onward and upward. The mountains on either side of the Southern Pacific tower up in peaks 10,000 feet high, and afford quite a change of scenery from the bed of the sea from which we have just emerged. The temperature begins to drop. We find it comfortable to put on our vests again, and then our coats; and it is not long before I begin to realize the need of my overcoat—a useless thing which I have lugged 2000 miles all for naught—or at least I thought so up to this time. The air begins

FRANK M'NAY'S BEE-CAVE.

to grow chilly, for it is getting toward evening. As our train stopped at the various points, oranges, bananas, and all tropical fruits, are offered at ridiculously low prices. As we speed on, here and there I see beeyards, and bee-men working to prepare for the honey-flow which is bound to come in a few days. Ever and anon we pass heaps of oranges lying on the ground. They were culls, or slightly rotten. Here they were, all going to waste because there was no market, or at least it did not pay to ship to the East any thing but the select fruit.

Beautiful orange-groves and ripe fields of grain flit by, and such cultivation! Finally we land in Los Angeles, indeed the "city of the angels." In fact, this country for 100 miles around seems to be God's country if any part of the world deserves that name.

I put up at the Natick House, a large hotel in the center of the city, where one can get board and lodging on the European plan. A large beautifully lighted room, clean bed, and modern furniture, for 25 cents; and meals, the very best of them, for the same money. One can live in Los An-

FRANK M'NAY UNDER FIRE (BEE-STINGS)

geles very economically, if he chooses; or if he wants to be in style, and be in with the nabobs, he can pay as high a price for hotel accommodation as he desires; but as I was not a nabob, I was content to live on a level with common people.

Almost the first bee-keeper I met in Los Angeles was Mr. Frank McNay, formerly of Mauston, Wis. He was particularly successful as a bee-keeper in his old State, beginning in the business when he was only 17 years old. In his early experience he had more difficulty in selling a single barrel of honey than he had later on in selling carloads. He located something like 25 different apiaries in Wisconsin, and was doing a flourishing business; but ill health compelled him to seek a new location. He wandered westward until he landed in California. He had made a fair competence, and it was not necessary for him to work as hard as he formerly did; and when we met he was keeping bees for pleasure as well as profit. He lived in Los Angeles, and had one and possibly two out-yards not very far from the street-car line, and within two miles of Pasadena. At the last-named city we secured bicycles, and took a run out around to one of his out-yards. It is shown opposite, and over beyond is what is known as Eagle Rock. On the top of this one can, on a clear day, see very distinctly the beautiful outline of the ocean some 20 miles away, and the islands off the coast of California, 20 miles further still.

The apiary is located up on the mountain-side, and the bees of it, like all California bees, were very cross; and as I had neglected to bring along with me a veil I had to "stand and take it." Even when we entered the door of the honey-house and sampled some of the beautiful, thick, water-white sage honey, the rascals would even go through the door and attack us there.

As we strolled through the apiary, Mr. McNay said he had something he wished to show me, and so together we walked up the mountain-side, and every now and then I would run into the Spanish needles, and—oh the exquisite pain these give to a tender-foot if he is not careful! The old residents have a respectful fear of these needle-points, and are always careful not to run into them. It was not long before I learned to look before I stepped.

As we clambered and climbed we finally reached the mouth of a genuine bee-cave where the bees were flying in and out. It had never been explored, and no one knows how many tons of honey are stored back in the dark recesses. To give you an idea of

the size of the entrance I asked Mr. McNay to sit down by the side of it while I took a couple of snap shots, and I here reproduce both of them. Those ugly bees from the yard followed us up there, and were stinging us right and left; but McNay, the old hardened veteran in the business that he is, paid no more attention to the stings than he would if the bees had been so many flies following us about. Even while I was taking the picture they were peppering him, and the pictures show how well he can stand "under fire." Even his eyes and bald head seemed to be objects of their wrath.

I have run across many veterans who could take stings without wincing; but McNay

FRANK M'NAY'S EAGLE ROCK APIARY, CALIFORNIA.

beats any man I ever saw. I can stand a few stings; but when it comes to taking them without smashing the rascals, that is something I can not do. If my lens had been a little more powerful I think I could show you the bees on his bald head, and even the bee-stings.

I must not close without mentioning a remarkable feat performed by Mr. McNay in the production of a lot of honey. While in Wisconsin he took 250 colonies of bees into the northern part of the State, and secured a *carload* and a *quarter* of basswood and willow-herb honey. I doubt if such a record in migratory bee-keeping is equaled.

SOUTHWEST TEXAS AS A BEE COUNTRY; A
FRIENDLY NOTE OF WARNING TO
NEW COMERS.

I have been noticing the recent prominence given Southwest Texas as a honey country, in the bee journals; and fearing that some one would come here without a fair conception of the facts has prompted me to write this note of warning. It is a fact that Southwest Texas is a good bee country, and that, although some localities, like Uvalde, Bee, and Wilson Counties, are now well stocked, there is a good deal of room yet in unoccupied territory. The bee-keepers here heartily welcome all bee-keepers to come and join us, believing that "the more the merrier," and in the universal brotherhood of man, especially of bee-keepers.

Southwest Texas, as, indeed, does almost all of Texas, prides itself that it is not afflicted with that dread disease *foul brood*. I personally have never yet seen a case of it, and wish to say that I do not want to; neither do the bee-keepers here want any of it, and they will go to any extreme measure to keep it out. We wish to request that all be careful and bring none of it here or else the bee-keepers already here will make them wish they had not. I have heard them say that, should a man bring it here, his bees would be burned and himself drummed out of the country, and I believe they would do it, and could you blame them?

I insist that their view of the question is eminently right and just to all concerned; and although I hope the disease will never be brought here, I for one can be depended upon to use any or all measures for its eradication. We do not wish to seem harsh, nor to make any one feel in lisposed toward us; but we wish all to be in possession of the facts. I hope to see the day when all this great country will be filled up with live up-to-date bee-keepers, and all this vast amount of honey that is now going to waste saved. I shall be glad to give any facts, in regard to this country, to all interested; but remember, however, that all bitters have their sweets, and we would rather have you investigate in person.

H. H. HYDE.

Floresville, Texas, March 6.

"SIXTEEN THOUSAND FIVE HUNDRED DOLLARS."

The above is a strange heading for an article for GLEANINGS; but as some bee-keepers don't have that much, I head this article with the above amount. It was in the summer of 1890 that I took a trip to that Texas bee-man's land, "the honey Eldorado, or Klondike," that the editor is telling us of (wish he could have been along).

I was with Major H. H. Boon, the law partner of Congressman Hutchinson, of fame. The two had secured a judgment against the Santa Fe R. R. Co. in favor of J. Butler Terrell, who was badly smashed in a railroad wreck, for the sum of \$16,500. The railroad company had given the shrewd lawyers land in that paradise that the editor of GLEANINGS wrote about, and they unlocked the hidden secrets of that paradise for four hundred years, revealed to man what had been, as well as we can look at the future by the light of the past; then the lawyers saw it, and sold the land, and held judgment for what it failed to pay. Armed with sharp crosscut saws the modern man sawed the mighty oaks down, and read in their "growth-rings," under the microscope, Nature's hidden secrets—secrets that had been buried as far back as four hundred years—buried in the mossy oaks to be read by progressive man. Very dark and gloomy is the record—periods of dry years back for four hundred years is the story—periods of wet years or rainy years—honey years—and then what? Death and desolation—a burning desert, strewn with dead and dying animals; no grass, no water, no vegetation, a desert creeping and crawling with venomous snakes, the deadly rattler, that leaves his mark everywhere in the dry sand. Tanks all go dry, wells go dry, and people flee for their lives. I had an old schoolmate who struck the desert period with a loving young wife, two little ones, and five thousand in cash. He was a bright, happy, hopeful young Christian. His name is Cohen Harris, and his tales of drouth, death, and misery would fill more than a full copy of GLEANINGS; but at last every cent of his five thousand was gone, and he left that paradise an old man in only a few years, and that will be the history that GLEANINGS will give if it lives to chronicle the history of that country for the next twenty years—and it may be much sooner than that—that the bees "go dead" along with cattle and other animal life.

So, lookout, paradise hunters, as your paradise may be only burning desert, as history is said to repeat itself, and the history in those old mossy oaks can be read by any one who cares to read it.

Caimito, Cuba. W. W. SOMERFORD.

GRADING RULES OR SUPPLY-DEALERS—
WHICH?

I believe that every producer of comb honey is anxious to produce the grade that will bring the highest price in the market—the fancy grade—and also that, when he has carefully graded his product, and has marked it "fancy," he wants to be sure that it is fully up to the rules which govern that particular grade. It is a deplorable fact that, with the surplus-appliances advertised and recommended by the supply-houses of the country, no one can produce really fancy comb honey according to the rules adopted by the North American Bee-keepers' Association.

It is evident that something is wrong. Either the standard for the fancy grade is too high or else the surplus-appliances are not up to the standard required to produce a really fancy grade of comb honey. I believe the standard for the fancy grade, as originally adopted, is not too high; in fact, it could be higher. The fancy grade should be just what its name implies in every respect. Not only the honey should be fancy, but also the wood which surrounds it. I have seen honey in the market in sections that were soiled and dirty, while the honey they contained was really fancy; yet who would think of classing such as fancy honey? No amount of scraping or sandpapering would ever make them presentable. What is the use of going to the expense of buying snow-white sections if the "fancy" grade admits any old section, no matter how soiled, only so it is well scraped? I believe that, instead of lowering the standard of fancy honey, and, by so doing, cheapening that grade just to omit our imperfect appliances or implements, it were far better to raise the standard of our supplies so that we can produce a really fancy grade of comb honey, or else be content to place our product in the grade in which it belongs.

Justice to those who will produce a really fancy article, and expect a fancy price, demands that we do this instead of forcing them to compete in price with a grade that has been cheapened by lowering the standard of that grade. By using the wide frame or section-holder, with quarter-inch top-bar in connection with the plain section and fence, the sections, when filled, will be as clean outside as when they left the sandpapering-machine, and no scraping is required to permit them to pass as unsoiled by travel-stain or otherwise.

Wakeman, O.

J. E. HAND.

[As I understand Mr. Hand it is not that supply-dealers put out poor supplies, but that bee-keepers buy second-quality sections or use out-of-date appliances to such an extent that the quality of the comb honey put out is affected. If such a policy saves a fraction of a cent, and depreciates the honey one or two cents, it is penny wise and pound foolish.—ED.]

THE AMOUNT OF WAX IN OLD COMBS.

Your answer to Wm. Bloch's question, p. 198, sets me all on nettles. "Under ordinary circumstances" you would not be surprised if he did not get even half a pound. Whew! I should like to get a ton or two of slumgum after he had gotten out his half pound. I would get about 5 pounds to his half pound.

Let me tell you what I did twice, as an illustration: Some years ago I helped a friend transfer a small box hive, capacity about equal to eight L. frames. We saved and transferred all of the straight comb, considerably over half; and as he wanted a little wax I took the leavings home to

melt up for him. I took a large cast-iron stove-kettle, with a small hole in the bottom, and put it in the oven, with a tin spout to carry the wax out at the partly open door. I allowed it to drip out all it would, and got 2 lbs. of wax out of not over four L. frames of *very* old black *natural* comb.

The other case happened last fall. I bought nine colonies. Four were in ten-frame L. hives, two in nine-frame Biehl hives (about the same capacity as nine L. frames). One was in a two-frame Dibbern hive, and two in box hives of about the capacity of twelve L. frames. There, we have about 92 L. frames, or their equal. Now for the result:

First, I found about 25 nice straight L. frames, which I set into my hives. Then I cut all the rest out and extracted the honey; then I filled 24 L. frames *full solid* with rich straight combs, which left about 43 L. combs and the cappings for wax. I expected about 10 pounds.

I took a 50-lb. lard-can, and inside put a wire-cloth basket. In the bottom, near one side, I had a small hole for the wax to come out at; and directly opposite in the side, near the bottom, I made a hole to take the spout of the tea-kettle. I turned on the steam; and after all was in, and hot, I applied about 300 lbs. pressure as long as the wax would run. The result was 19 lbs. of nice wax.

The next time you have the opportunity, examine some old black comb, or melt a small piece. That blackness and weight are not all dirt. It is rich in wax.

Swedona, Ill.

S. F. TREGO.

[I am sincerely obliged to you for the correction. When the matter was up some time ago I remember that half a pound of wax was the amount we got out of a certain amount of comb; and when I dictated the answer I was under the impression it was for the whole hive; but since you call my attention to it I now recall that half a pound was the amount per comb, on the average. I find that C. G. Ferris, a man who has had a wide experience in rendering up old comb, on one test with some old wormy combs secured about 6 ounces per comb. Mr. F. A. Gemmill, of Canada, in another experiment, took about 8 ounces to the comb, and there are other times when more can be obtained.—ED.]

LABELING COMB HONEY.

Mr. Root:—I believe the wholesale buyers of comb honey and the commission men are largely responsible for the artificial-comb-honey lie getting a start. They don't want the producer of the honey to put his name and address on any honey they handle, not even upon the case in which it is shipped. I believe the lie would never have started if all the best grades of comb honey had borne the name and address of the producer. The consumer would have much more confidence in its purity if the producer's name was upon the honey he

buys. I believe nothing would *restore* confidence in the purity of comb honey sooner than to have every producer of comb honey place his name and address upon every section of his best grades.

D. I. WAGAR.

Flat Rock, Mich., Mar. 11.

[There is some truth in what you say. But this is the contention of the commission man; and, for argument's sake, suppose I am that man. I have sold, we will say, a good deal of Mr. A's honey—a very fine honey which bears A's stamp. My customers are well pleased with it, and call for more of the same brand. I get out, and can't get any more because A is sold out. I may have tons and tons of B's honey that is just as good, or better, bearing the brand of B. I ship it, and my customer "kicks," retorting that he ordered honey branded with A's stamp. The point is here: If *neither* A's nor B's honey had been branded or stamped, the B lot of honey, of the *same grade and quality*, would have passed muster readily. But, taking it all in all, I am rather of the impression that, if all comb honey were labeled by the producer, it would have a strong tendency to bring about confidence in that product. If Mr. A can produce an extra-fancy grade of honey, and certain customers demand it at any price, rather than take any other honey "just as good," why should not A receive credit for his skill, and get a corresponding price? I believe Dr. Miller always sells his comb honey to one man; and, if I am not mistaken, that man is willing to buy his crop in advance. Why? Because he knows that Dr. Miller's honey is always of a certain quality and grading.]

There is a great deal to be said on both sides of this question; but I think the weight of the argument is in favor of labeling or branding. It certainly would redound to the credit of producers to put up a fine quality of goods. There is not a doubt that such honey would bring a higher price in the open market.—ED.]

VENTILATION AND DAMPNES IN BEE-CELLARS. REPLY TO G. M. DOOLITTLE.

Mr. Root:—I have just read Bro. Doolittle's review of my ventilation article, and find no complaint to make. However, it would be a great pleasure to know if he ever recommended the experiment of wintering, indoors or out, bees with from only 5 to 10 pounds of honey. I get some general facts regarding bees from Mr. O. J. Hetherington, and have not in mind now that bee-keepers in Eastern New York have ever so recommended.

It is not impossible that the weight of ten feet of dry pine lumber should have doubled in weight in Mr. Doolittle's cellar, and contributed very materially in balancing the loss of honey between the dry hives put in cellar and the "equal to green" taken out. Practically, 5 or 10 lbs. honey consumption

will not prove to be the weight recommended for safe wintering.

I like the allusion to trouble incident to ventilation. The plan I have adopted as an experiment would render the experiment useless, rationally considered, if no notes of temperature and conditions had been observed. Would bee-keepers have been any better informed had GLEANINGS made no mention of the bees under the machine-shop?

I have doubts about the arrangement I made in my flue for closing it. I am not sure that closing it would have raised the temperature. I have never closed it, and don't know. It is generally admitted that dampness lowers the temperature; if so, to have closed it would have defeated the object.

The temperature these warm days ranges from 32 to 45 outdoors. My bee-cellar shows no variation of any account, showing 50 morning and evening, when I pull up out of the top of the cellar my thermometer. I was glad to hear from your machine-shop. We may all be glad to run an engine to winter our bees yet. T. F. BINGHAM.

Farwell, Mich., Mar. 10.

[One thing we have proven is that noise does not disturb bees. And another thing we have proven to our own satisfaction, and that is, that ventilation, and lots of it, keeps the bees quiet.—ED.]

200 LBS. (HALF COMB HONEY) FROM ONE QUEEN.

It was a very poor season here last year. I harvested over 1000 lbs. of honey from 25 colonies. I had one queen that I bought from J. P. Moore, of Morgan, Ky., whose bees gathered 200 lbs. of the 1000 lbs. This Moore stock gathered 100 lbs. of comb honey (white clover), and their queen did not swarm. I had a little over 100 lbs. of extracted from what you call heartsease, which is very plentiful here some seasons. I have had very good success for a beginner, which I give your valuable A B C and GLEANINGS credit for. I could never have been so successful in so short a time without them. The Homes department has been a great comfort to me. L. C. MEDKIFF.

Salem, N. J.

COVERS COVERED WITH CANVAS INSTEAD OF PAPER.

As regards hive-covers, I would give considerably more for one covered with canvas, and painted, than one with Neponset paper on it. One covered with canvas will stand (if painted once in three years), ten times the hard usage that the paper one will. In fact, after it has had three coats of paint when made, you could walk on it and not hurt the canvas. After one has tried the canvas I don't think you could get him to use the paper. F. P. BRIGGS.

Ayer, Mass., Dec. 26.

Thou God seest me.—GEN. 16: 13.

Not with eye-service, as men-pleasers, but as the servants of Christ, doing the will of God from the heart.—EPH. 6: 6.

For the past two weeks I have been exceedingly busy; in fact, I have hardly had time to run over to that little greenhouse to rest up. We have had quite a large run of trade in seeds, and there have been quite a few complications. There have been misunderstandings, and sometimes some good friend who entrusted his money to our care has been wronged, and nobody felt like taking the liberty of righting the wrong, nor even of writing him a pleasant letter of explanation unless I did it myself. Oh how much better we all feel when some one takes the time to explain matters, and assure us he has not been unmindful of our interests! Sometimes it costs money to make things pleasant; but in the greater number of cases, so it seems to me, about all it costs is to take time to assure the one who has been wronged (or who has got it into his head that he has been wronged) that there was no intention of selfishness, nor even a want of friendly feeling and interest.

During those busy days a man came to me and said he wished I would go out in the woods and measure that wood. At first I hardly knew what he was talking about. Then I did remember that along in the fore part of the winter I told a man he might cut up some beech-trees that were among my basswoods. First I told him I would go out in the woods and show him the trees I wanted him to cut; but as I did not get time I told him to go and cut down all the beech-trees he could find. But I told him I wished he would take them big and little, just as they came, and not pick out the easiest ones to convert into firewood. Then I forgot all about it. He and his boy had been at work more or less all winter, and had put up 25 or 30 cords. I took my wheel and rode up the railroad track about one mile, and then I left the wheel over in the lots, out of sight, and got over into the woods. I took my tape-line out of my pocket and measured the height of a pile of wood. It was a little more than four feet. When I took the length I found it a little more than eight feet. The next cord turned out the same way, and pretty soon I began to look smiling and happy. Do you know why? Because I have had so many disappointing experiences in setting people at work away off in the woods or fields out of sight I fear I have become a little discouraged. I have not lost my faith in God because of my disappointments; but I fear I have come pretty near losing my faith in poor infirm humanity. I went along to pile after pile, with the same result—the measure overran just a little. When I

found two piles that had been tipped over I said to myself, "Well, I am sure there is a good cord there, any way. The man who is doing this work is evidently honest."

Pretty soon I met him and said, "Why, friend, your cords overrun a little in height and a little in length. Is that the way you do business?"

"Yes, Mr. Root, I always try to give good measure. I wish to do so because, when your eye comes to look it over, I don't want you to be disappointed. But there is one thing I am still more anxious about. I profess to live believing that there is an *all-seeing eye* away up above us all that looks down and watches over us. I want to give such measure as will be pleasing in *his* sight."

I need not tell you that this was one of my happy surprises. Oh how much good it does us—how happy it makes us feel (and I am *sure* I may say *all* of us, and every one who reads these pages), when we come across somebody who *recognizes* God's watchful eye, and tries to have his work right and honest in God's sight! When a man has this feeling in his heart he does not need watching. All anxiety and solicitude on your part are at an end. You can, with perfect assurance, entrust him with the care of your property, your money—yes, even your good name. And what a restful feeling it gives one when he finds such a person!

Now, what I am saying would seem to imply that I am myself (*of course*) just one of that sort, but I am afraid I am not. I am afraid that, if I were sawing and splitting that hard tough beech that grew partly in the clearing, I should not have given as good measure as this man of whom I have been speaking. He said he did not make very big wages, and some of his friends laughed at him for going ahead with the job; but he told them he had promised to cut some 25 or 30 cords of wood during the winter for me, and he was *going to do it*. The bargain was, he was to have 60 cts. a cord. I told him I did not like to be outdone in giving good measure, and so I suggested that we make the price *65 cents*.

If *every* man were upright, and tried to be honest before God, I presume we should not appreciate these gems among humanity. After I have been obliged to be among a crowd of cursing and swearing men, I appreciate clean men as I never did before. After I have had some very trying experiences with a helper who is cross and contrary, I value all the more those who are willing, cheerful, and obliging. In fact, I am not sure but it *does us good* to have to get along for a while with disagreeable people, so we can justly and truly appreciate God's *noble men* and *noble women*.

Now, I dislike to say so much about the *bad* side of humanity; but I do not know how I can give this man of whom I have been talking full credit without telling you of some of my discouraging experiences. I bought this piece of woodland near our

home mainly for the basswood-trees growing on it. There are thousands of them, large and small, and I wanted the other timber out of the way. When I talked about getting a man to cut it into cordwood my neighbor said there was nobody who would cut wood (by the cord) nowadays. They used to do it in olden time, but it was too hard work. When it became known, however, that I wanted somebody to cut wood by the cord during winter, a man volunteered to do it for 60 cts. per cord. The old price had been 50. I am speaking of 18-inch stovewood. I told him I would not only give 60 cents but I would give 65 if he would take every thing as it came, little and big. He agreed to this, and I told him to begin nearest the road until I got around again. A few days later I found he had gone away off to the back part of the woods, and, in fact, across the line, and had cut down some nice beech-trees on *another man's* land! When I remonstrated he admitted he had disobeyed orders, and had *not* worked according to contract, giving no other reason for not keeping his word than that "no man could make a living" in cutting such trees as he found where I had directed him to start in. Of course, I could have refused to give him any pay for cutting wood on land that did not belong to me, contrary to orders; but he is a poor man, and so I called it a mistake, and paid him just the same, and now I have got to fix it up with my neighbor as best I can.

Let me give you one more illustration. I wanted some plowing done. A man with a big stout team said he would do it if I would give him \$3.50 a day. While I went along with him and helped to get the bushes and stumps out of the way he did a very good day's work. One day, however, I was obliged to be absent. I told him I did not expect to be back till night. Unexpectedly I got back in the middle of the afternoon. When just in sight of the field I caught a glimpse of him disappearing with his team over the hill. As he said in the morning he had a bad headache I concluded he had decided to put in only three-fourths of the day's work. When he came to settle up, however, he insisted on having pay for a full day's work. Now, one does not like to be small and close, especially about trifles; but where one lets a good many things of this kind pass, thinking it is not of sufficient importance to make a fuss about, he finds himself, finally, where his crop *costs* more than he gets for it. "Eternal vigilance" is not only the price of liberty, but it is the price of success in almost any work. Lots of boys—yes, I might say lots of men—will do very well—yes, I may say tiptop—as long as their employer goes right along with them; but there are not very many (and I say it with sadness) who have more regard for the all-seeing eye of the great God above than they have for any human employer. It is praiseworthy, no doubt, to have somebody who tries hard to have his work make a good

showing before his employer when night comes; but, oh how much more praiseworthy it is to find one who has the faith to believe (and let his daily actions show that belief) that it is more important to have every thing right in *God's* sight than before any human being! What a millennium it would be here on earth if we had people of that sort!

I have had many kind and encouraging words because people have found that I, even while alone and unwatched, strive to be honest and unselfish; but, to tell the truth, I do it only by fits and starts. The voice of conscience and the influence of the Holy Spirit (perhaps both are one and the same thing) are constantly *prodding* me. I do not quite like the word, but I do not think of another that will express it. It is as natural for me to be selfish as it is to breathe, and I find myself almost continually yielding to it if I do not look out; but that better spirit comes in, at least occasionally, and may God be praised that it comes occasionally, if not always. Let me illustrate it by a little story which I think bears on this point.

I told you about the dogs and cats, how they annoyed me. The neighbors said, "Shoot the cats and the dogs too." They said the law would uphold me in so doing—it was my duty. But, dear friends, suppose one of you should visit me. Suppose you should see A. I. Root, the author of these Home papers, with a pistol in his hand, trying to shoot a cat! I presume it would be only *trying*, for I never fired a pistol in my life—that is, I do not remember that I ever did, and the poor cats would stand a good chance of not getting hurt at all. Suppose, however, I should be lucky enough to hit one, and it should drag itself away in terrible suffering. No, no! I am 62 years old, and have never fired a pistol so far. I may possibly commence, but not on a cat or a dog, God helping me. Well, the cats drove away the poultry from their cold victuals, and then I drove them away with corncobs; then I threw ears of corn; but they looked up in my face confidently, and seemed loath to believe that I had any very wicked feelings toward them. A nice little hammer hangs up on a nail near the door. One great ungainly cat bothered me by breaking the glass in my poultry-house in order to get in. You may remember that I remonstrated with the boys some years ago because they could not make the chickens stay away from the plant-beds. I told them if they would give the chickens a *good* scaring they would go away and *stay* away, and I gave them an example of how it was to be done. I frightened the flocks of hens, roosters and all, so they cackled about it nearly all the rest of the afternoon, and they did not come near our plant-beds for weeks afterward. Well, one day when I was sorely tried by this cat I declared I would give it such a scaring as I did the chickens. I took the hammer off the nail, and, remembering my practice with an In-

dian tomahawk when I was a boy, I took aim at the cat's head. The hammer whizzed through the air and struck the cat fair and square on the side of the head. The poor thing just rolled in agony, and gave me such reproachful looks I could not get over it. The voice of conscience I have been telling you about then commenced:

"Now, old fellow, are you satisfied? A few days ago you had the toothache and the earache; but probably all the pain you suffered then was not a comparison to the suffering you have deliberately inflicted on this poor dumb brute. It is winter time, and poor pussy was very likely starved into being bold. You, with your possessions, could doubtless feed all the cats in Medina County, and not be impoverished either. Is it really true that, with all the abundance you have around you—an abundance that God in his mercy has entrusted to his care, you can not allow even this poor cat a meal of the cold victuals you bring out to the poultry?"

Conscience kept on, but I think I will not tell all it said. I would gladly have patted poor kitty on her head and tried to explain to her how sorry I was. When she got a little better she slipped off among the evergreens to get over her pain the best she could. Now, I would have given a good deal to have that foolish act undone; and when the cat came up next day to get her share of the cold victuals, apparently as good as ever, and certainly not cherishing any unkind feelings toward me, it rejoiced my heart.

Suppose, dear friends, that some power beyond us could help us to see all our faults and littleness as the loving eye of the great Father above sees it all, what a different world this would be! As I think it over while I study the problems that beset this great nation of ours, I pray again and again that the influences of the Holy Spirit *may* shine into our hearts, each and all, and help us to see the folly of heaping up dollar after dollar when not even the smallest fraction of it can be carried along when we die. It is true, we may heap it up and leave it to our relations; but a great many times of late I have thought it would be far better for said relations if the deceased had put the money to some good use before he died, instead of leaving it to them to wrangle over, and possibly give it all to some lawyer who is too lazy to work for a living.

And now, friends, can we not get an example from the man who was cutting down tough beech-trees, and splitting them into firewood for 60 cents a cord? If he in his tough job—a job that took an unusual amount of strength—could afford to give *good measure*, so that his daily tasks might be pleasing in the sight of God, can not we, each and all, at least *strive* a little harder to do *our* work in such a manner that we are sure God is pleased when he looks down lovingly on us? And can we not have faith enough to *believe* our other text is true where it says, "Thou God seest me"?

Tobacco.

GETTING A "RAISE" IN WAGES—CIGARETTES.

Every ambitious young man or woman in our employ is looking forward to advanced pay—that is, I hope they are. I would not give much for a boy or girl who did not have some ambition and enthusiasm in this matter of advanced wages. Daily we are called on to discuss the matter. A boy—we will call him John Brown for illustration—goes to his foreman and says he has worked a long while at 12½ cents an hour, and asks if he is not worth a little more. I do not know just what the foreman does, but I presume they talk the matter over more or less, and the foreman refers the matter to one of the firm. The reply is usually something like this:

"If John Brown is worth more money than he is getting, all things considered, of course he should have it. We are always glad to hear that any of our employees are worth more money than they are getting. This young man is diligent, capable, and is making progress, is he?"

"Why, yes; reasonably so."

"Is he on hand every time when the machinery starts?"

"Well, to tell the truth he is not. A good deal of the time he is half an hour late, and sometimes a whole hour."

"Have you talked with him about this? Can he give any good reason for it?"

"Yes, I have talked with him about it; but he does not seem to do much better."

"Do you know whether he is out nights? Has he any bad habits?"

"Why, to tell the truth, I think he is out nights; but I do not know that he has any bad habits except smoking cigarettes."

At this perhaps there is a smile on both sides; may be it is a sad smile on both sides—I rather hope it is. Later on John Brown is interviewed by the senior member of the firm.

"John, is it really true that you are smoking cigarettes?"

"Why, Mr. Root, I will not tell any lies. I do smoke cigarettes; but I am not smoking now as many as I used to."

"John, you surely know what the papers and almost everybody else is saying about cigarettes. Do you read a daily paper?"

John shakes his head.

"Haven't you heard that, since the Chief of the Weather Bureau has set the example, quite a number of manufacturing firms are declining to employ boys who persist in cigarette-smoking? Haven't you heard of that?"

"Never heard of it."

"Well, you surely have heard that some of our leading physicians say that every cigarette a boy smokes is one nail more in his coffin."

John smiles at this, and says he has heard it. He further adds that he will try hard to be on hand promptly when the

whistle blows; but he does not promise to give up cigarettes.

Now, I do not know that I am able to decide, just now, *where* our duty lies right here. I do not like to lay down cast-iron rules. I would a hundred times rather use some means to induce the boy or boys *themselves* to agree to what we feel is best for their interests and ours; and I think I shall leave this question right here.

Under circumstances like the above, should John have an advance in wages? If he does his work as well in every respect as others who have more than 12½ cents an hour, very likely he should have more. But in the cigarette business he is harming others. He has admitted to me that he can not buy cigarettes here in Medina. He acknowledges that he has to send away to get them. Well, to save expense the boys usually club together and send off for a supply, and therefore he must do a little canvassing. He hunts up other boys who want them, or recommends them to other boys so they can save expense by buying them by the quantity. Ought a boy, under such circumstances, expect promotion, *especially* if he is working for The A. I. Root Co.? Instead of answering this myself I wish to get the opinion of our helpers generally. Is John worth as much money as the one who has not got into the cigarette habit, leaving out for the time being this other question about being on hand when the whistle blows, or a little before?

"We are marching on."

Do you wonder what called forth the above? Well, it is the contents of a postal card just at hand.

Gentlemen:—Please give us advertising rates and discounts; also state whether you have any objection to liquor ads. Please mail us sample copy, and oblige
Yours truly, GINSENG DISTILLING CO.
St. Louis, Mo., Mar. 13.

How does the above indicate we are marching on? Why, this distilling company frankly admit that some periodicals, we do not know how many, are refusing to accept "liquor ads." May God be praised for this much. And now, friends, I will tell you what we, the people who support these periodicals, are to do. Look the advertising pages of your home paper all over. If you see any thing in it that even indirectly helps advertise the liquor business, make a protest to your editor, and have the *paper* stopped if he does not *stop* the whisky advertisements.* If all Christian and temperance people would do this simple thing that I have suggested, it would clean our advertising pages pretty thor-

*I wish the editor of every periodical in the land could read what that exceedingly popular book, "In His Steps," has to say about receiving advertisements of whisky, tobacco, etc.; and it is gratifying to know that, notwithstanding the bold stand this book takes against these things, it is having and has had a larger sale than any other book since Uncle Tom's Cabin came before the world. This would seem to indicate that there is a hungering and thirsting after righteousness—yes, even among the great masses of the common people. May God be praised for such a book, and may it still continue to go "marching on."

oughly of this disgraceful sort of advertising. Will you not help us in the battle for righteousness, temperance, and purity? Just one thing more:

What kind of a distillery is the *Ginseng Distilling Co.*? Is the ginseng industry being hitched on to the whisky business? A very good friend of mine, and an expert chemist, has recently written me that the *sole reason* why the Chinese pay such extravagant prices for ginseng roots is that they have a notion or superstition that it tends to stir up the lower passions. If this is true, every good man and woman should let it alone, just as they would let—well, we will say just as they are now making up their minds to let tobacco alone. Still another thing:

I guess I might as well admit right here that even *Gleanings* was entrapped into accepting the advertisement, for a time, of the Heller Chemical Co., Chicago. One of our veteran subscribers called our attention to the fact that that company sent in their catalog an inset sheet of pictures in colors of fancy demijohns containing "rock-candy whisky," and a long list of liquors with fancy names. Of course, at the head of the sheet they declared these liquors were never sold to anybody except for "medical uses." But they were pushing their wares with most extravagant advertising. How do they know—or, better still, how much do they *care*—who sends for it, providing they get the money? Another note at the bottom of the sheet says the packages are very carefully done up, so that no one can see or even guess the contents—as much as to say, "You church-members and temperance people who would like some nice whisky, but are afraid to have people know about it, can get it from *us* 'on the sly,' and nobody in the world will be a bit the wiser."

THE FUTURE OF THE TELEPHONE — RURAL TIMEPIECES.

The following extract from the *New York Independent* suggests what may be done with a rural telephone, if it is not being done already.

New services for the rural telephone are constantly being devised. One of the most interesting and advantageous is the "News service." Every evening at seven o'clock all the farmers in a group, or in a circuit of groups, take their stand at the telephone. There will be a ring, and then the opening call, "Good evening! now keep quiet! It is one minute and a half after seven o'clock by the regulator." Every farmer at once regulates his watch or his clock. When this is done the call comes again: "Weather indications for the next thirty-six hours are: Cooler and cloudy, with probable rains;" or, "Weather clear and warmer." Then come market quotations. The price of corn, wheat, oats, rye, butter, chickens, eggs, apples, and whatever else the farmer may have in season, is announced. Then come news items, such as constitute the main headlines of newspapers.

The part about having farmers keep a uniform and standard time commends itself particularly to me. I suppose you all know how it is, or, perhaps I had better say, how it used to be, with timepieces in the country. There are no two alike. When I was up at

our ranch in Michigan last summer I let my watch run down, and wanted to catch a train. I rode through the rain so as not to be too late, and pretty nearly used myself up with over-exertion, and then found I was *an hour* ahead of time. The farmer's clock, eight miles away from the station, was a whole hour out of the way, and this thing has happened to me several times. Yes, I know we have a lot of contrary, stubborn farmers, who, if they *could* have the correct time by telephone, would insist on setting their clocks by the sun, saying sun time is "God's time," or some such foolishness. Hired men come to work before the correct time, and oftener away behind, just because there are no two timepieces alike; and this clumsy and slipshod way of setting clocks costs the country at large thousands of dollars yearly. There can be no sharp promptness such as banks, railroads, and great business corporations *must* have, without uniform timepieces. May God be praised for the telephone on this account if for no other—it enables us to correct our clocks and watches, at least once in 24 hours, so we can have them all pretty nearly, if not quite, "on the dot."

ALFALFA CLOVER SEED SPECIALLY ACCLIMATED FOR COLD REGIONS.

Mr. Root: I have been much interested in all that you have published about alfalfa, but the half has not been told about it. No doubt if more farmers knew just how to plant the seed, and could be conveniently supplied with good fresh seed, more would be induced to try a little piece. To that end I am willing to go half way and help them out. Though I am hardly able to furnish seed free and pay the postage, I can send seed if they will help pay the postage, so it will not be all a matter of labor of love.

I have a quantity of nice fresh seed from Nevada, a high, cold section where the thermometer goes down to 20 below zero, and I consider such seed much better for the colder sections than seed matured in a warmer climate.

I inclose 30 cts. for insertion of three lines in your Wants and Exchange column, and wish that you would give me—one of your old twelve-year subscribers—an editorial note on the subject.

This is a magnificent section of the State for our bees, and thousands of acres of the best pasturage. Why is it so neglected in your columns? I have never seen an item from our vicinity in GLEANINGS since reading it.

WILLIAM C. AIKEN.

Angwin, Cal., March 14.

Friend A., I am glad to give an old subscriber, or anybody else, encouragement in introducing new and improved seeds; but I am afraid you are undertaking to be *too* liberal. Permit me to suggest that you send 10 cents' worth of seed for one of the dimes, and use the other to pay postage—see page 305. You may get snowed under with applications if you undertake to be too liberal, and I think you had better have a little printed slip to go with each package of seed, telling the farmers how to sow it and how to manage it. Here and there we have patches of it in Ohio; and after they once get a stand it seems to hold its own for many years—that is, if it is cut at the proper time and managed right.

ONLY 20 LEFT.

We have left some of those slightly damaged copies of Prof. Cook's "Bee-keeper's Guide" that went through our fire a year ago. The reading matter is all right—only the cloth covers are somewhat damaged. Price, to close out, 60c a copy, by mail; or, with weekly *American Bee Journal* a year, both for only \$1.40. Regular price of the book alone is \$1.25. Big bargain where you get both book and *Journal* (52 copies) for \$1.40. Better order quick if you want book on either these low offers. Now is the time to begin to read the *American Bee Journal*. It will continue to be a great paper in 1902. And it comes *every week*.

We are headquarters in Chicago for Root's Bee-keepers' Supplies. Catalog, and sample of *American Bee Journal* free.

HONEY QUEENS!

**Laws' Long-tongue Leather Queens.
Laws' Improved Golden Queens.
Laws' Holy Land Queens.**

Laws' queens are the standard-bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four apiaries. Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & cat. 288 free. W. Chester, Pa.

The best article ever published in the Bee-keepers' Review, according to the judgment of many who took the trouble to write and express their views, was contributed in March, 1901, by Mr. S. D. Chapman, of Mancelona, Mich. He outlined a system peculiarly adapted to his locality and needs. A leading feature was the removal of the queens at the opening of the honey harvest.

He has now contributed another article, and it appears in the March issue for this year. It discusses the swarming-problem, and it seems to me that he gets nearer the bottom facts of the matter than has any other writer. He shows clearly *why* bees get the swarming fever—how it can be avoided, or how brought about. So thoroughly does he understand the matter, that he has been able to so make up a colony that one-half of it will swarm, leaving the combs deserted, while the other half will refuse to budge. This issue also gives some very novel and original hints and illustrations on hive covers.

Send ten cents for this issue, and with it will be sent two other late but different issues, and the ten cents may apply on any subscription sent in during the year. A coupon will be sent entitling the holder to the Review for 90 cts.

W. Z. Hutchinson, Flint, Michigan.

Listen, Bee-keepers!

The Lone Star Apiarist

A new bee-journal in the great Southwest, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world. With flowing wells, and the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now, \$1 a year. The *Apiarist* is not only for the South, but for all America and foreign countries too. Our company has purchased the *Southland Queen*, and now we have the only bee-journal in the South.

10 CENTS

That's all it costs to get acquainted with the

Rocky Mountain Bee Journal.

We want to send it on trial to every reader of *Gleanings* **Three Months for 10 cts.** This vigorous young monthly has just entered its second year on a **paying basis**, and has become the recognized mouthpiece of the bee-keepers of the great Rocky Mountain alfalfa regions. Address

The Rocky Mountain Bee Journal,
Box 611, Boulder, Colorado.

NONE BUT THE BEST QUEENS

ARE GOOD ENOUGH FOR ANY ONE.

No bee-keeper wants to give hive room to inferior bees. The best queens fill their hives with brood. The best bees fill their supers with honey. Every bee-keeper knows this, but does not know that *our strain* of Italians are in the *lead*. Try them. You will not be disappointed. Choice tested queens, \$1.00 each. Untested, 75c; \$8.00 per doz. Send for price list.

J. W. K. SHAW & CO., Loreauville, La.

1902 Queens

from the best strains of either three or five banded Italians. Untested, 85 cts. each; tested, \$1.25 each; breeders, \$3.00; 1-frame nuclei with warranted queen, \$2.00; 2-frame, \$3.00. Bees and queens ready to mail any day. My bees are selected from the very best strains that money can buy. I make a specialty of queen-rearing and fill orders promptly. I insure safe arrival of queens. This is a postal money-order office. Remit with money-order to

DANIEL WURTH, Caryville, Campbell Co., Tenn.

1902 ITALIAN QUEENS.

From imported and home-bred mothers, by up-to-date methods. Tested, \$2.00 Untested, \$1.00; six, \$5.00; twelve, \$9.00. Full colony, \$6.00; three-frame, \$2.00; two-frame, \$1.50; add the price of queen. Discount on large orders. Write for circular.

Rufus Christian, : Meldrim, Georgia

Headquarters for the Albino Bee.

The Best in the World.

If you are looking for the bees that gather the most honey, and are the gentlest of all bees to handle, buy the Albino. I can also furnish Italians, but orders stand fifty to one in favor of the Albino. Select tested Albino queen before June, for breeding, \$1.00; tested, \$2.50; untested, \$1.00; Italians, \$1.00. I have located an apiary near Rocky Ridge, Md., and most of my queens will be shipped from there. Other supplies will be furnished from Hagerstown, Maryland. Address me at Rocky Ridge, Md., for queens. S. Valentine.

Minnesota Bee-keepers' Supply Mfg. Co.,
Nicollet Island Power Building, Minneapolis, Minn.

HONEY.

We are still having a fair demand for comb and extracted honey, and trust we shall close out present stock before any of the new crop is on the market. We hope to hear from any in need of honey to supply their trade.

MAPLE SUGAR AND SYRUP.

The maple crop is rather light, and the producers are asking good prices for what little we are able to secure. We can not at this writing offer syrup in lots of 5 gallons or more at less than \$1.00 per gallon, or sugar in 50-lb. lots or more at 12 cts. per lb. for best grade. If interested, write us.

BEESWAX WANTED.

We wish again to urge bee-keepers who have combs to render or wax to ship to lose no time in getting it to market. A little later, wax will accumulate much more freely, and the price will begin to go the other way. We have not for years paid as high as we are now paying for wax—29c cash, 31c in trade, delivered here, and you should take advantage of high-water mark in prices. We have been getting in some large shipments, and have enough to keep us running for the present, but will be ready for some as soon as you can get it to us. It sometimes takes a month for wax to arrive from far western points. If you have any to furnish, get it on its way at the earliest date possible. Should you have an offer that nets you more than our price, let us hear from you before you let it go if you can.

HASTINGS SHEAR AND KNIFE SHARPENER.

Here is a little tool that ought to be in every house that possesses a sewing-machine. It is clamped to a sewing-machine stand just where the belt comes through, and is driven by the sewing-machine belt just the same as you drive the bobbin-winder. It has

a wheel of carborundum, about three inches in diameter, securely mounted in a metal frame, with adjustable guide for holding shears, knives, or any of the various household tools that need sharpening. It will pay for itself in a very short time. It can be sent by mail safely for 8 cts. postage, and the price is only one dollar. Send for one, enclosing one dollar, to N. P. Robinson, Wellington, Ohio; and if you don't find it well worth the investment, let us know. If you can sell any to your neighbors, ask for terms to agents. Don't send your orders to us, but send to the address above. We will vouch for Mr. Robinson's honesty.

BUSINESS AT THIS DATE.

Present indications point to a congestion of orders such as we had in 1898. We are now an average of three weeks behind on orders, and some carload orders are over four weeks old. Less than carload shipments we try to ship within a week or 10 days, either from here or one of our agencies. We are doing our utmost to keep up the quality as well as the quantity of our output, and shall have to ask the utmost patience on the part of our customers. We have orders in for eighteen carloads, as well as a goodly number of less than carload shipments. We have shipped so far this season, since the middle of December, 65 carload shipments. The forehanded people who order in the fall or winter what they need for the coming season are the ones to be envied and congratulated in times like this, and imitated in larger numbers in the years to come.

Special Notices by A. I. Root.

Chas. Vanderbilt, Lyons, N. Y., can still furnish Sir Walter Raleigh potatoes, second size, at \$2.00 per bbl.

SWEET CLOVER AT THE OHIO EXPERIMENT STATION.

Press Bulletin No. 223, March 24, of this year, tells us pretty clearly why sweet clover should never be classed with noxious weeds. If you want the bulletin, write to the Ohio Experiment Station, Wooster, Ohio. This bulletin treats mainly of its value for plowing under on poor soils where nothing else will grow. It also explains very clearly why it is rarely if ever found under circumstances where it should be considered in any way even an annoyance to a progressive farmer.

YELLOW SWEET CLOVER.

For the first time we have enough now so we can offer seed of the yellow sweet clover; but as it is scarce and high-priced the price will be, for 1 lb., 20 cts.; 5 lbs. or more at 18 cts. If wanted by mail, add 10 cts. extra for packing and postage. We have seed only with the hulls on. M. M. Baldridge, of St. Charles, Ill., who has tested it for years side by side with white clover, says it is a biennial, the same as white clover, and that it blooms two or three weeks earlier than the white. It is not as tall as the white, but produces a great quantity of bloom. I saw it on his place when I called on him in July, 1900.

FUMIGATION METHODS.

The above is the title of another new book by the O. Judd Co. It treats principally of fumigation by the use of hydrocyanic acid gas. Killing insect pests marks one of the greatest strides ever made in agriculture. Heretofore we have been more or less helpless victims to these terrible scourges. Now, however, by spraying bisulphide of carbon, and, lastly, by the use of this new gas, we are getting to be pretty well masters of the situation. Not only fruit-growers and nurserymen, gardeners and florists, millers and grain-dealers, but the farmers of the country at large, where they keep posted, are getting the upper hand of these hindrances. Wormy apples are a disgrace to the orchardist; and gardeners, seedsmen, and grain-dealers should be ashamed to offer any of their products infested with insect enemies. The book has 313 pages. It is full of pictures. The latter part of it tells all about fumigation with carbon bisulphide. The result of the work of the experiment stations, and the laws in regard to insect pests, are given for the whole United States. I think the book will prove to be a valuable acquisition to our agricultural literature. Sent postpaid from this office for \$1.00.

MAIL ANY DAY.

Orders are now being booked for queens, untested and tested. Golden Italian selected tested, \$1.50. Breeders, \$2.50 to \$5.00. None better.

Queens!

Buy them of H. G. Quirin, the largest queen-breeder in the North. The A. I. Root Co. tells us our stock is extra fine. Editor York, of the *American Bee Journal*, says he has good reports from our stock from time to time, while J. L. Candy, of Humboldt, Neb., has secured over 400 lbs. of honey (mostly comb) from single colonies containing our queens. We have files of testimonials similar to the above.

Our breeders originated from the highest-priced long-tongued red-clover queens in the United States.

Fine queens, promptness, and square dealing have built up our present business, which was established in 1888.

Price of Golden and Leather-colored Queens Before July First.

	1	6	12
Selected Warranted.....	\$1 00	\$5 00	\$9 50
Tested	1 50	8 00	15 00
Selected Tested.....	2 00	10 50	
Extra Selected Tested—the best that money can buy	4 00		

We guarantee safe arrival to any State, continental island, or any European country. Can fill all orders promptly, as we expect to keep three to five hundred queens on hand ahead of orders. Special price on 50 or 100. Circular free. Send all orders to

Quirin the Queen-breeder,

Money-order Office.

Parkertown, Ohio.

TEXAS QUEENS!!

From the Lone Star Apiaries. G. F. Davidson & Son, prop's, have made great preparations for the coming season to accommodate their many customers with either Long-tongue, Imported Stock, or Golden Queens. They have bought out the queen-rearing business of O. P. Hyde & Son, Hutto, Texas, and by buying and increasing their

number of nuclei, they are better prepared than ever to cater to the trade of the bee-keeping public. One of Root's Long-tongue Breeders; Imported Stock direct from Italy. Goldens from leading queen-breeders. Fine breeders of each of the above have been added to their yards. Safe arrival and satisfaction guaranteed. Send for queen circular and price list. We are now prepared to fill orders for Cyprian and Carniolan queens. Good strains. Address

G. F. Davidson & Son, Box 190, Floresville, Texas.

Business Bees!

Are the kind you want for honey. We have them in our select five-band strain. J. F. Aitkins, Reno, Nev., has been buying several dozen queens a year—last year 180; have his order for 100 in April. F. L. Cravcraft, Havana, Cuba, bought about 200 in fall of 1900; also 100 last April; has placed his order for 100. These men are large honey-producers. They know what they are about. We are better prepared than ever to handle orders. Prices: Untested queens, \$1.00; dozen, \$9.00; after May 1st, \$8.00; tested, \$1.50; select, \$2.00. Send for circular. J. B. Case, Port Orange, Fla.

THE CYPHERS INCUBATOR

IS THE STANDARD HATCHER OF THE WORLD.

Used with uniform success on twenty-six Government Experiment Stations in the U. S., Canada, Australia, and New Zealand; also by America's leading poultrymen and many thousands of persons in every walk of life. Guaranteed to give satisfaction or price refunded. The original and only genuine non-moisture incubator, fully covered by patent. Winner of

GOLD MEDAL AND HIGHEST AWARD AT THE PAN-AMERICAN,

Oct., 1901. Illustrated, descriptive, 16 page circular FREE. Complete new catalogue for 1902 containing 180 pages, 2x11 inches in size, for 10c in stamps to pay postage. Illustrates over 100 of America's largest and most successful poultry plants. Ask for book No. 74 and address nearest office.

Cyphers Incubator Co., Buffalo, N. Y., Chicago, Ill., Boston, Mass., New York, N. Y.

IT TAKES FIVE CATALOGUES

printed in five different languages to tell the people of the many points of superiority

SUCCESSFUL Incubators & Brooders.

One 500 egg machine will hatch more chicks than 20 steady old hens each time it is filled with eggs. They will be stronger, more healthy chicks, too. These machines will do for you just what they have done for thousands of others. Write for 158 page Catalog enclosing 6c to pay postage. We ship machines and handle correspondence for the East from our new house in Buffalo. Write nearest office.

DES MOINES INCUBATOR COMPANY,

Box 503, Des Moines, Iowa, or Box 503, Buffalo, N. Y.

JUST AS NATURAL as the old hen and a good deal more reliable. Doesn't break its eggs or make its chicks lousy. Doesn't stay off the nest and allow the eggs to chill but hatches every egg that can be hatched.

THE PETALUMA INCUBATOR

Absolutely perfect as to incubator essentials—proper application and distribution of heat and moisture, regulation and ventilation. For 64 to 324 eggs. We Pay Freight anywhere in U. S. Catalog free.

PETALUMA INCUBATOR CO.,

Box 125, Petaluma, California, or Box 125, Indianapolis, Ind.

A MILLION TESTIMONIALS 30 DAYS TRIAL WILL

THE FRED W. MUTH CO.,

FRONT AND WALNUT.

CINCINNATI, OHIO.

Queens You Should Have

Does blood tell in other stock? Give your bees a chance. Stock used for breeding the queens offered—not from a sport, but my pick out of an apiary giving last season an average yield as follows:

Honey Gathered.

102 lbs. extracted and 68 lbs. comb honey per colony besides increase and stores for winter.

Quality of Comb Honey Produced.

"Man! It would dazzle you."—Wm. McEvoy, Ontario Government Inspector of Apiaries.

Wintering Qualities.

Up to the present, January 30, I never found these bees to show the least indication of unrest—always perfectly quiet. They are wintering perfectly.—Frank T. Adams, Brantford, Canada.

General Commendation.

Out of those queens you sent me I have produced the best race or strain of bees I ever owned. Remember that is saying a lot, as I have tried every breed imported to this country. The bees winter better, build up, and stand cold chilly winds in spring better, and are more suitable than any bees I ever owned. For the season they gave me about double the honey the pure Italians did, and more increase. Glad you are going into the queen business, and are going to join our ranks again. We are much in want of a few men like you.—C. W. Post, Ex president Ontario Beekeepers' Association (owns 365 colonies).

S. T. Pettit, Canada's most successful comb-honey producer and bee-keeper, says: "The blood in my apiary is largely the progeny of queens sent by you, and they are grand bees."

Prices of Queens.

They are duty free to the United States. Tested, \$2.00 each; \$10.00 for 6; \$18.00 per dozen. Untested until July 1st, \$1.25 each; \$7.00 for 6; or \$12.00 per dozen. Same after July 1st, \$1.00 each; \$5.50 for 6; or \$10.00 per dozen. Larger quantities, prices on application. Postage stamps taken for fractions of a dollar. To be fair to every one, no selected tested queens are offered. Every one has the same chance. The above queens are bred from a careful selection of Italians and Carniolans. Pure Italian and Carniolan queens same price. Price of full colonies on application. Orders booked as received, and filled as quickly as possible. Order early. Address

R. F. Holtermann,

Bow Park Co., Limited, Brantford, Ontario, Canada.

TWENTY-FIVE SWARMS of bees for sale. Queens bought of J. P. Moore in 1901, of his best strain, in new Dovetailed hives, telescope cap, Hoffman frames, and foundation. \$5.00 each. Also a lot of new hives well painted; also 30 Alley queen and drone traps to sell cheap.

BETTER THAN SPRAYING.

Don't lug barrels of water around when spraying. Use the poison direct. Our

Common Sense Dust Sprayer

and Insect Extirminator is a most ingenious device that is rapidly supplanting the old methods. It blows the finely powdered dust into every nook and crevice. Reaches the bottom as well as the top of leaves. Destroys insect life on plants, vines, shrubs and trees. Just as effective for vermin on poultry and pigs. More rapid than spraying. Descriptive circulars and testimonials free. **HILLIS DUST SPRAYER CO., Box 17, ST. JOSEPH, MO.**

Books for Bee-keepers and Others.

Any of these books on which postage is not given will be forwarded by mail postpaid, on receipt of price.

In buying books, as every thing else, we are liable to disappointment if we make a purchase without seeing the article. Admitting that the book-seller could read all the books he offers, as he has them for sale, it were hardly to be expected he would be the one to mention all the faults, as well as good things about a book. We very much desire that those who favor us with their patronage shall not be disappointed and therefore we are going to try to prevent it by mentioning all the faults, so far as we can, that the purchaser may know what he is getting. In the following list, books that we approve we have marked with a *, those we especially approve, **, those that are not up to times, †; books that contain but little matter for the price, large type, and much space between the lines, ‡; foreign, §. The bee-books are all good.

As many of the bee-books are sent with other goods by freight or express, incurring no postage, we give prices separately. You will notice that you can judge of the size of the books very well by the amount required for postage on each.

BIBLES, HYMN-BOOKS, AND OTHER GOOD BOOKS.

- Postage. [Price without postage.]
- 8 Bible, good print, neatly bound 20

 - 10 Same, words and music, board covers 75
 - 3 New Testament in pretty flexible covers 05
 - One-third off on all Gospel Hymns mentioned above.
 - 5 New Testament, new version, paper covers 10
 - 15 Story of the Bible ** 1 00
- Years ago, when Huber was a little boy, he got hold of this book and read it clear through, asking his mother questions without number all along through the book. When he got to the end he turned over to the fore part and commenced to read it through again. We laughed at him somewhat, but let him go on. But when he started the *third* time I remonstrated. Now, this illustrates what sort of a book this is. We sold hundreds of them; but finally, when the book got to be old, it was taken out of our book list. I do not know just why, but nevertheless orders have kept coming for that wonderful book by Charles Foster, the Story of the Bible. Almost any child will read it if he gets a chance; and who can tell the effect it may have in fixing his young mind upon things that are good and pure and true? By buying them in considerable quantities we are enabled to furnish such a large book (notice the postage is 15 cts.) for only \$1.00.
- 4 Stepping Heavenward** 18
 - 5 Tobacco Manual** 45
- This is a nice book that will be sure to be read, if left around where the boys get hold of it, and any boy who reads it will be pretty safe from the tobacco habit.

- 3 Merrybanks and His Neighbor, by A. I. Root... 15

- 10 The Honey-makers, by Miss Margaret W. Morley 1 15

This is a story of the life of the bee, told in very interesting style—how it lives, gathers honey, and all about it. While clothing the general subject with an air of poetry, it seems to be entirely within the limits of known facts while attempting to deal with them. We believe it will give all thoughtful bee-keepers a greater liking for their business to read it. Probably it has more to do with the curious traditions connected with bees than any other book of the kind.

- 10 The Life of the Bee 1 30
- Thos. Wm. Cowan editor of the British Bee Journal, in his review of Maeterlinck's work, says: "Not since the appearance, in 1876, of Bucher's 'Mind in Animals' have we had a book about bees more charming, or one that we have read with greater pleasure, than Maeterlinck's 'Life of the Bee.'"

MISCELLANEOUS HAND-BOOKS.

- 5 A B C of Carp Culture, by Geo. Finley 25
- 5 A B C of Strawberry Culture,** by T. B. Terry. New edition, revised and enlarged; paper, 45c; cloth, 68c; by mail, 75c.
- 5 A B C of Potato Culture, Terry** New edition, revised & enlarged; paper, 45c; cloth, 68c, mail 75c. This is T. B. Terry's first and most masterly work.
- 8 Barn Plans and Out-buildings* 90
- Canary birds, paper 50
- 2 Celery for Profit, by T. Greiner** 25
- The first really full and complete book on celery culture, at a moderate price, that we have had. It is full of pictures, and the whole thing is made so plain that a schoolboy ought to be able to grow paying crops at once without any assistance except from the book.
- 15 Draining for Profit and Health, Warring 85
- 8 Domestic Economy, by I. H. Mayer, M. D.** 30
- This book ought to save at least the money it costs, each year, in every household. It was written by a doctor, and one who has made the matter of domestic economy a life study. The regular price of the book is \$1.00, but by taking a large lot of them we are enabled to make the price only 30 cents.
- 10 Farming for Boys* 1 15
- This is one of Joseph Harris' happiest productions, and it seems to me that it ought to make farm-life fascinating to any boy who has any sort of taste for gardening.
- 10 Fruit Harvesting, Storing, Marketing, etc. 75
- It has been well said that it is an easier matter to grow stuff than to sell it at a proper price after it is grown; and many men fail, not because they are inexperienced in getting a crop, but because they do not know how to sell their crops to the best advantage. This is the first book of the kind we have had as an aid in selling. It not only tells all about picking, sorting, and packing, but gives all the best methods for storing for one or two days or a longer time. It also tells about evaporating and canning when there is a glut in the market. It discusses fruit packages and commission dealers, and even takes in cold storage. It is a new book of 250 pages, full of illustrations. Publisher's price, \$1.00.
- 1 Farming with Green Manures, postpaid** 90
- This book was written several years ago; but since competent labor has got to be so expensive, and hard to get, many farmers are beginning to find they can turn under various green crops cheaper than to buy stable manure, and haul and spread it—cheaper, in fact, than they can buy fertilizers. This book mentions almost all plants used for plowing under, and gives the value compared with stable manure. Some of the claims seem extravagant, but we are at present getting good crops, and keeping up the fertility, by a similar treatment, on our ten-acre farm.
- 7 Farm, Gardening, and Seed-growing** 90
- 10 Fuller's Grape Culturist** 1 15
- 5 Garden and Farm Topics, Henderson** 60
- 12 Gardening for Pleasure, Henderson* 1 10
- 12 Gardening for Profit** 1 10
- 8 Gardening for Young and Old, Harris* 90
- This is Joseph Harris' best and happiest effort. Although it goes over the same ground occupied by Peter Henderson, it particularly emphasizes thorough cultivation of the soil in preparing your ground; and this matter of adapting it to young people as well as old is

brought out in a most happy vein. If your children have any sort of fancy for gardening it will pay you to make them a present of this book. It has 187 pages and 46 engravings.

3 | Grasses and Clovers, with Notes on Forage

Plants..... 20
This is by Henry A. Dreer, author of the book, "Vegetables Under Glass" that has had such a large sale of late. This little book tells how six tons of grass has been grown to the acre, and gives much other valuable matter.

10 | Greenhouse construction, by Prof. Taft**..... 1 15

This book is of recent publication, and is as full and complete in regard to the building of all glass structures as is the next book in regard to their management. Any one who builds even a small structure for plant-growing under glass will save the value of the book by reading it carefully.

12 | Greenhouse Management, by Prof. Taft**..... 1 15

The book is a companion to Greenhouse Construction. It is clear up to the times, contains 400 pages and a great lot of beautiful half-tone engravings. A large part of it is devoted to growing vegetables under glass, especially Grand Rapids lettuce, as well as fruits and flowers. The publisher's price is \$1.50; but as we bought quite a lot of them we can make a special price as above.

5 | Gregory on Cabbages, paper*..... 20

5 | Gregory on Squashes, paper*..... 20

5 | Gregory on Onions, paper*..... 20

The above three books, by our friend Gregory, are all valuable. The book on squashes especially is good reading for almost anybody, whether they raise squashes or not. It strikes at the very foundation of success in almost any kind of business.

| Handbook for Lumbermen..... 05

5 | Home Pork-making; 125 pages, illustrated..... 40

I think it will pay well for everybody who keeps a pig to have this book. It tells all about the care of the pig, with lots of pictures describing cheapens, appliances, all about butchering, the latest and most approved short cuts; all about making the pickle, barreling the meat, fixing a smoke-house (from the cheapest barrel up to the most approved arrangement); all about pig-troughs; how to keep them clean with little labor; recipes for cooking pork in every imaginable way, etc. Publisher's price is 50 cents, ours as above.

10 | Household Conveniences..... 90

15 | How to Make the Garden Pay**..... 1 35

By T. Greiner. Those who are interested in hot-beds, cold-frames, cold green-houses, hot-houses, or glass structures of any kind for the growth of plants, can not afford to be without the book. Publisher's price, \$2.00.

2 | How we Made the Old Farm Pay—A Fruit-

book, Green 15

2 | Injurious Insects, Cook..... 10

10 | Irrigation for the Farm, Garden, and Orchard* 85

By Stewart. This book, so far as I am informed, is almost the only work on this matter that is attracting so much interest, especially recently. Using water from springs, brooks, or windmills to take the place of rain, during our great drouths, is the great problem before us at the present day. The book has 274 pages and 142 cuts.

3 | Maple Sugar and the Sugar-bush**..... 25

4 | Peabody's Webster's Dictionary..... 10

Over 30,000 words and 250 illustrations.

5 | Manures; How to Make and How to Use

Them; in paper covers..... 30

6 | The same in cloth covers..... 65

| Nut Culturist, postpaid..... 1 50

3 | Onions for Profit**..... 40

Fully up to the times, and includes both the old onion culture and the new method. The book is fully illustrated, and written with all the enthusiasm and interest that characterizes its author, T. Greiner. Even if one is not particularly interested in the business, almost any person who picks up Greiner's books will like to read them through.

| Our Farming, by T. B. Terry**..... 1 50

In which he tells "how we have made a run-down farm bring both profit and pleasure."

If ordered by express or freight with other goods, 10c less.

1 | Poultry for Pleasure and Profit**..... 10

8 | Practical Floriculture, Henderson.*..... 1 10

10 | Profits in Poultry.*..... 75

1 | Silk and the Silkworm 10

10 | Small-Fruit Culturist, Fuller 75

2 | Sorghum, Stock Beets, Strawberries, and Cement Floors. By Waldo F. Brown..... 08

This little book ought to be worth its cost for what is said on each of the four different subjects; and the chapter on cement floors may be worth many dollars to anybody who has to use cement for floors, walks, or any thing else. In fact, if you follow the exceeding plain directions you may save several dollars on one single job; and not only that, get a better cement floor than the average mason will make.

2 | Sweet Potatoes; Forty Years' Experience with,

By Waldo F. Brown **..... 08

This little book, by a veteran teacher at our farmers' institutes, ought to be worth many times the price to everybody who grows even a few sweet potatoes in the garden. It also gives full particulars in regard to handling and keeping this potato, which is difficult to keep unless you know just how.

10 | Talks on Manures* 1 35

10 | The New Agriculture; or, the Waters Led Cap-

tive (a \$1.50 book) 40

11 | The New Egg-Farm, Stoddard**..... 70

This is an enlarged edition of the 50-cent book published 25 or 30 years ago by H. H. Stoddard. If I could have only one poultry-book it would be the New Egg-farm. This book is of special value to me because it not only discusses most emphatically the value of exercise to poultry, but it touches on the value of exercise to all other animated nature including humanity. The book has over 300 pages and 150 illustrations. It is entirely different from any other poultry-book in the world, inasmuch as it discusses mechanical contrivances so that all the varied operations of a poultry-farm may be done as much as possible with the aid of machinery. The regular price is \$1.00, but by buying a quantity we are able to furnish it at price given.

5 | The New Rhubarb Culture**..... 40

Whenever apples are worth a dollar a bushel or more, winter-grown rhubarb should pay big. It does not require an expensive house nor costly appliances. Any sort of cellar where it will not freeze is all right for it; and the small amount of heat necessary to force the rhubarb costs very little. The book is nicely bound in cloth, full of illustrations, mostly photos from real work, 130 pages. Every market-gardener should have this book, for the lessons taught indirectly, in regard to forcing other crops besides rhubarb. Publisher's price 50c.

2 | Treatise on the Horse and his Diseases..... 5

5 | Tile Drainage, by W. I. Chamberlain..... 35

Fully illustrated, containing every thing of importance clear up to the present date.

The single chapter on digging ditches, with the illustrations given by Prof. Chamberlain, should alone make the book worth what it costs, to every one who has occasion to lay ten rods or more of tile. There is as much science in digging as in doing almost any thing else; and by following the plan directed in the book, one man will often do as much as two men without this knowledge.

3 | Tomato Culture 35

In three parts. Part first.—By J. W. Day, of Crystal Springs, Miss., treats of tomato culture in the South, with some remarks by A. I. Root, adapting it to the North. Part second.—By D. Cummins, of Conneaut, O., treats of tomato culture especially for canning-factories. Part third.—By A. I. Root, treats of plant-growing for market, and high-pressure gardening in general.

3 | Vegetables under Glass, by H. A. Dreer**..... 20

3 | Vegetables in the Open Air**..... 20

This is a sort of companion book to the one above. Both books are most fully illustrated, and are exceedingly valuable, especially at the very low price at which they are sold. The author, H. A. Dreer, has a greenhouse of his own that covers one solid acre, and he is pretty well conversant with all the arrangements and plans for protecting stuff from the weather, and afterward handling to the best advantage when the weather will permit out of doors.

3 | Winter Care of Horses and Cattle..... 25

This is friend Terry's second book in regard to farm matters; but it is so intimately connected with his potato-book that it reads almost like a sequel to it. If you have only a horse or a cow, I think it will pay you to invest in a book. It has 44 pages and 4 cuts.

3 | Wood's Common Objects of the Microscope**.. 47

8 | What to Do and How to be Happy While doing

It, by A. I. Root 65

8 | Same in paper covers..... 40

THE A. I. ROOT CO., Medina, Ohio.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, uns: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My nice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present.—M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albino, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Bees by the point, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

The Jennie Atchley Co., Beeville, Tex.

Now Ready!

Sixty-four Page Catalog

of every thing bee-keepers need. Illustrated and fully described. Especially valuable to beginners for the information it contains. Send your address on a postal and get it now. Established 1884.

J. M. Jenkins,

Wetumpka, Elmore Co., Ala.

Kretchmer Mfg. Co., Box 60, Red Oak, Ia.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apiary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Supers, etc. Write at once for a catalog.

Chas. Spangler, Kentland, Ind.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.
Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

CHICAGO.—Choice white comb honey produced from basswood and white clover is scarce, and brings 15c per lb. All other kinds of white is in over supply, and the market is weak at 12@13; light-amber grades, 10@11; dark, 8, 9; candied and mixed lots, 7@8. Extracted weak with white ranging from 5½@6½; amber and dark, 5@5½. Beeswax selling at 32, and in good demand.
R. A. BURNETT & Co.,
April 7. 199 South Water St., Chicago, Ill.

BOSTON.—The demand for comb honey is fairly good considering the time of year. Stocks on hand ample for the demand. Prices remain as per our last quotation. Fancy, 15@16; A No. 1, 14@15; No. 1, 13@14; honey in glass-front cases about 1c less. California light amber, extracted, 7½@7½; Florida honey in barrels, 6@6½.
BLAKE, SCOTT & LEE,
April 7. 31, 33 Commercial St., Boston, Mass.

BUFFALO.—The stock of honey in our market is light. Demand is slow, but prices hold quite steady. No jobbing demand, or prices would be shaded in lot sales. Fancy white comb, 14@15; A No. 1, 13½@14; No. 1, 13@13½; No. 2, 12@12½; No. 3, 11@12 dark, 10@12. Extracted white, 6½@7; amber, 6@6½; dark, 5@5½. Beeswax, 28@30.
W. C. TOWNSEND,
April 9. 84, 86 West Market St., Buffalo, N. Y.

NEW YORK.—Comb honey.—Last year's crop is practically cleaned up but as we wrote a little while ago we had received a new crop from Cuba, and are now receiving a new crop from the South. Demand is fair at 14c for fancy white; No. 1, 13; No. 2, 12; amber, 10@11. Extracted.—The market is decidedly dull. Very little demand, with large stocks on hand, some of which no doubt will have to be carried over, and indications point to a further decline in prices. We quote white, 6; light amber, 5½; amber, 5; Southern, 5½@58 per gallon, according to quality. Even these prices are shaded in car lots. Beeswax scarce and firm at 29 @30.
HILDRETH & SEGELKEN,
April 7. 265-7 Greenwich St., New York City.

CINCINNATI.—The general tone of the honey market is lower. Water-white comb honey sells from 14@14½, and is hard to obtain; extra fancy, 15. Extracted has weakened a little, and sells from 5@5½; fancy, 6@6½.
C. H. W. WEBER,
April 17. 2146 Central Ave., Cincinnati, Ohio.

SAN FRANCISCO.—Comb honey, 10@12. Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Southern California reports 10 inches of rain to date; this makes a half crop secure. Should additional rains follow, the percentage will increase. The census bureau credits New York State with producing, in 1899, 3,342,497 lbs. of honey; California, 3,667,738; and, "Tell it not in Gath," Texas, 4,780,204 lbs. Now let the Texans blow their "Long Horns," while California "goes way back (of Texas) and sits down." Prospects in Central and Northern California are excellent for a good season. Wax, 27—30. E. H. SCHAEFFLE,
March 26. Murphys, Calif.

DETROIT.—Fancy white comb honey, 15; No. 1, 13@14; dark and amber, 11@12. Extracted white, 6½@7; dark and amber, 5@6. Beeswax, 29@30.
Apr. 8. M. H. HUNT & SON, Bell Branch, Mich.

MILWAUKEE.—The market continues very quiet on honey. The supply is fair, and demand not urgent. Sales slow, especially on the extracted of all grades. Choice comb honey meets with more favor, yet sales are not as usual at this season of the year. We continue to quote: A No. 1 sections, 13@15; No. 1, 13@14c. Off-grades entirely nominal. Extracted in barrels, kegs, and cans, white, 7½@8c; amber, 5@7c. Beeswax, 28@28.
A. V. BISHOP & Co.,
March 19. 119 Buffalo St., Milwaukee, Wis.

FOR SALE.—2000 lbs. honey, buckwheat mixed, at 7c, freight prepaid, in 60-lb. cans, two cans in a case.
B. F. AVERILL, Howardsville, Va.

WANTED. Comb honey in any quantity. Please advise what you have to offer.
EVANS & TURNER,
Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity.
R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

WANTED.—Extracted honey, either large or small lots; parties having same to offer, send samples, and best prices delivered, Cincinnati, O. We pay cash on delivery.
THE FRED W. MUTH CO.,
Front and Walnut Sts., Cincinnati, O.

WANTED.—Comb honey in Danzenbaker sections. We can use both white and amber.
THE A. I. ROOT CO., Medina, Ohio.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.
WM. MORRIS, Las Animas, Col.

FOR SALE.—Extracted honey, from alfalfa, at 7c per pound. Send for sample.
D. S. JENKINS, Las Animas, Col.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.80, per case of two 60-lb. cans, net.
ARKANSAS VALLEY APIARIES, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7c, in kegs and cans.
DR. C. L. PARKER
Sta. A, R. F. D., Syracuse, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.
SEAVEY & FLARSHHEIM,
1318-1324 Union Avenue, Kansas City, Mo.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must say you want your adv't in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange for cash, beeswax, or offers, 1 12-in. and 2 6-in. Root foundation-mills.
M. H. HUNT & SON, Bell Branch, Mich.

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax. O. H. HYATT, Shenandoah, Iowa.

WANTED.—Comb honey in Danzenbaker sections in exchange for supplies, or will pay cash. We prefer large lots of white honey, but can use some amber in this size.
THE A. I. ROOT CO., Medina, Ohio.

WANTED.—To sell Rocky Ford cantaloupe seed. Seed of these famous melons postpaid, 40 cts. per pound. Choice selected stock
H. F. HAGEN, Rocky Ford, Colorado.

WANTED.—To know who has 200 colonies of bees to sell cheap; also what young man would like to serve an apprenticeship with Quirin the queen-breeder.
H. G. QUIRIN, Parkertown, O.

WANTED.—To exchange New Cumberland black-raspberry plants (Cuthbert), Fay's Currants, blackberry (Snyder, Taylor, Western Triumph), for beeswax at 30c per lb., or cash. Wanted, old comb and slungum.
A. F. LAWRENCE, Hickory Corners, Mich.

WANTED.—To exchange Victoria rhubarb roots at \$1.25 per 100. White Wyandotte and Pekin duck eggs at \$1.50 per 30, and a Prairie State incubator, for strawberry-plants and bees.
GEO. M. AMES, Tamaroa, Illinois.

WANTED.—To trade good two-story building, fine location, for bees in good hives.
E. Y. PERKINS, Creston, Iowa.

WANTED.—To sell for cash, 5-gallon square tin cans in partitioned cases of two cans each, in lots of 20 cases or more, at about half the price of new cans. Having been in use once only, and as containers of honey they are practically as good as new. For particulars and prices, address OREL L. HERSHISER, 301 Huntington Ave., Buffalo, N. Y.

WANTED.—To purchase 150 colonies bees, L. frames. Must be clean of disease. State price f. o. b. cars.
OREL L. HERSHISER, 301 Huntington Ave., Buffalo, N. Y.

WANTED.—To sell five colonies of Italian bees with new eight-frame Root's Dovetailed hives complete for \$4.00 per colony. Strong colonies, free from all disease.
I. L. POWELL, Millbrook, N. Y.

WANTED.—To buy 50 to 100 colonies of bees in Colorado.
A. B. TACKABERRY, Cantril, Iowa.

WANTED.—To exchange a 32-caliber Winchester rifle for a 10-inch Root foundation-mill.
D. A. DISBROW, Belleview, Marion Co., Fla.

WANTED.—To sell 500 brood-combs, just a little larger than the Hoffman frame, at \$3.00 per 100, f. o. b. at Petoskey.
R. B. OLDT, Epsilon, Mich.

WANTED.—To sell a Caligraph typewriter for \$25. A substantial, long-lived, rapid machine, doing excellent work; sample on application; the best value for the money.
W. J. FINCH, JR., Carlinville, Ill.

WANTED.—To exchange brood foundation for beeswax or offers.
FRED W. BUTTERY, R. F. D. 43, Norwalk, Conn.

WANTED.—To sell 30 colonies of Italian and hybrid bees at \$2.50 per colony.
J. F. RASCH, Marilla, N. Y.

WANTED.—Second-hand or knocked-down hives. Describe them, with price. Also want a man who knows how to handle bees a little.
W. L. COGGSHALL, West Groton, N. Y.

WANTED.—To sell Gulf coast sea-shells, cabinet specimens and shells for all purposes. Prices low. Send 15c for 12 nice shells.
G. S. WARNER, Palma Sola, Manatee River, Florida.

WANTED.—One dollar for 15 W. P. Rock eggs; \$3.00 for 50, or \$5.00 for 100; from 93 to 95 scoring birds; cockrels and pullets, \$1.00 each; 75 cts. for one Golden Italian queen, or \$8.00 per dozen—after August 1st, 50c each or \$3.00 per dozen.

GEO. W. COOK, Spring Hill, Kansas.

WANTED.—To exchange 30 colonies of bees with fixtures, Hilton chaff hives—every thing up to date—for wall-paper stock or cash offers.
H. F. SWAN, Grand Rapids, Mich.

WANTED.—Beeswax, typewriter, and wheel-hoe and drill. Send for long list of articles to select from in exchange.
F. H. MCFARLAND, Hyde Park, Vt.

WANTED.—To exchange a Clark's cutaway harrow and a Brightest and Best blue-flame oil stove for bees or offers.
J. P. MOORE, Morgan, Ky.

WANTED.—To exchange 10 colonies of hybrid bees, some fine collie-shepherd pups, one good hound, some fine gent canary birds (beautiful singers) for a lady's or nice watch, a good shotgun, or almost any thing you have for trade except poultry. Address with stamp.
W. S. BRILLHART, Oakwood, Ohio.

WANTED.—To exchange a \$35.00 Henley wire and picket fence machine (to weave on the posts) for offers, or will sell for \$7.00, as I have no use for it. In good condition.
C. BROWN, Box 61, Dayton, O.

WANTED.—To sell one Zimmerman Autoharp No. 2 3/4, used very little, good as new. \$2.50 takes it.
MRS. N. O. PENNY, Nathan, Fla.

WANTED.—Bee keepers to study our advertisement and testimonial of queens in April 1st GLEANINGS.
R. F. HOLTERRMANN, Manager Bee Department, Bow Park Co., Limited, Brantford, Canada.

WANTED.—A honey-extractor. Also a foot-power circular saw. State kind and price.
O. W. JEFFERSON, Pittsford, Mich. Box 115

WANTED.—The address of a young or middle-aged man of some practical experience who wants to come to Colorado for his health and take the job (probably during May, June, July, and August) of attending to an apiary of 150 or 175 colonies. We have two apiaries, about four miles apart, and want a hand to take charge of either one as circumstances may decide. Apiaries are connected by telephone. We have a bee-house with two good living-rooms. Would like a man as an assistant to the one we have now. This is a good chance for one affected with lung trouble if not sufficient to interfere with work. Wages, \$40 without board or \$20 with per month. Address THE DENVER LAND CO., Denver, Colorado.

A. M. PATTEN, Manager.

Denver, Colorado.

VOL. XXX

APR. 15, 1902.

No. 8.

SOFT MAPLES bloomed March 24—12 days earlier than last year.

"A BEGINNER with a few brains, boards, and a buzz-saw, is the man before all others who feels called upon to invent a bee-hive."—*Editor Hutchinson.*

WHEN A COLONY SWARMS, what per cent of the bees go with the swarm, and what per cent remain? [This varies; and while I will not attempt to answer the question, I will put out a rough guess as an average. I should say 75 per cent go with the swarm, and 25 remain with the comb.—ED.]

H. MELZER, in *Centralblatt*, declares from abundant observation that bees get honey from red clover, not when it is deficient in growth, but when it is specially luxuriant, so that the tube is so filled with nectar that the bees can reach it. This occurs especially when hot dry days follow a thunder-shower. [This agrees with our experience.—ED.]

YOU APPEAR to think, Mr. Editor, p. 275, that I do not have confidence enough in Prof. Gillette's work. Just the opposite. I had too much confidence, taking his figures as entirely reliable, and, like the honest man that he is, he says that his reach measurements are not reliable. Yes, indeed, I think he will subscribe to my last statement, although he might prefer to say that tongue-length is not settled by measurement of tongue-reach. [You misunderstood me. I understood you to mean just what you now say in the foregoing.—ED.]

BRO. DOOLITTLE, on page 277 that man Brown gets you mixed up, or you get him mixed up, or else you both get me so mixed up that I can't understand English. You first state my question as I gave it, why is it erroneous to call a prime swarm a first swarm? and then you say I wish to know why it is erroneous to call a first swarm a prime swarm. Then you go to work and

answer the question that I never asked. Now will you kindly answer the question that has been waiting for an answer seven years? If you will please answer it I have another question to ask.

THE ONLY HIVE badly spotted with diarrhea last winter was one of the painted ones (I think there are three painted). I don't know whether the paint had any thing to do with it, but I remember another winter the hive with most dampness was painted. [I suspect that the other Miller (Arthur C.) would tell you there could be no possible difference between the painted and unpainted hive, because either one is smeared over on the inside with propolis, and therefore would not let moisture pass through. Is it not possible that what you observed was an accidental coincidence?—ED.]

ANSWERING your question, p. 275, I never put on more than one super at a time nowadays. Too much heat is needed to fill up two. The fact remains that I had just as fine work when I put on 56 sections at a time. [Yes, probably; but the fact remains that you do not consider it good practice to give too much room at the start; and if not good practice, you of course do not get as good results. While the honey that was secured was just as good and just as pretty, is it not true that the bees would be longer in getting into the supers when they had a great big empty space to go into and keep warm?—ED.]

FOR BEGINNERS who allow natural swarming, I want to suggest a plan for improvement of stock that is more than 40 years old (I mean the plan, not the stock, is so old). Strengthen with brood the colony with best queen, so as to get it to swarm first. Call it No. 1. When No. 1 swarms, put swarm in place of No. 1, and set No. 1 in place of No. 2, setting No. 2 on a new stand. When No. 1 swarms again (perhaps 8 days later), set the swarm in place of No. 1; set No. 1 in place of No. 3, and set No. 3 in a new place. As often as No. 1 swarms (and it may do so several days in succession), set the swarm in place of No. 1, and set No. 1 in place of some other full colony.

AN EXCELLENT little treatise on queen-rearing has just been published in France by Giraud-Pabou and Son, giving an up-to-date *resume* of methods used in this country and elsewhere. The experiment given, p. 522, GLEANINGS, 1900, is quoted quite fully to show that bees sometimes choose larvæ 4 or 5 days old for queen-rearing. But attention is not called to the fact that the bees chose the youngest larvæ they had, and that under ordinary circumstances there would have been plenty of larvæ young enough when the last cells were started. For when the brood was given to No. 18 the youngest egg was three days old, and under ordinary circumstances there would be eggs three days younger.

THE ADDED TOUGHNESS in foundation made by the new process is an excellent thing in the brood-chamber; but in the case of super foundation there may be a danger of its being carried too far.—D. D. M. in *British Bee Journal*. I wonder how much there is in that. [While the new process makes wax tougher it also makes it possible to use less wax in ordinary sheets of foundation, both brood and super. The result of this was that all sheets are made lighter. The ordinary foundation for sections is, as a rule, much lighter than that which was made years ago by the old plan. If the new wax is tougher, there is less of it, so there is and can be no more (if as much) midrib as before.—Ed.]

ARE YOU SURE you are not mistaken, Mr. Editor, in saying, p. 285, that there were no beet sugars on the market when A. I. Root made his experiments? He began bee-keeping in 1865, and at that time was not $\frac{1}{10}$ of the total sugar supply beet sugar? and didn't we have our full proportion in this country? We didn't *know* we were using beet sugar, though. [At that time, 1865, the beet sugars that were then made were confined almost entirely, if I mistake not, to Europe. Beet sugars did not come into use in this country until the beet was grown here, if I am correct. The growing of this, as you probably know, is a comparatively new industry in the United States; so I feel quite positive that the sugars that A. I. Root used along in the 70's were all cane.—Ed.]

QUITE A TRAFFIC in some parts of Germany is the sale of "naked" colonies, as they are called—bees drummed out without any combs. They are generally shipped from the middle of September to the first of October. [How far do they ship them, and how? Years ago, you remember, we used to do a business something of this nature, sending what we then called "bees by the pound." A large cage was prepared, filled with Good candy. The bees were shaken off the combs into a large funnel, which delivered them into this cage. They were weighed up; and if the scales showed, after deducting tare, a full pound, a wire-cloth cover was put on and the package of bees was sent by express. But we had to give

it up because so many of the bees died *en route*. We now ship in the form of nuclei on combs, and the results are very much more satisfactory.—Ed.]

BRO. A. I. ROOT, I'm afraid if we stop all papers that either directly or indirectly advertise the liquor business, as you advise, p. 298, most of us would do without papers. Rather than patronize a paper with a Sunday edition, I take the only daily I know of in Chicago without a Sunday edition, even though it brings the news to me nearly a day later; but the *Daily News* is not sinless in the way of advertisements. If you will get a number to band together, I'm ready to join you in doing without the news till a paper with clean ads. is started. [Don't you mean, doctor, we would have to go without *daily* papers? Surely there are weeklies without number that do not and never will accept any thing in the shape of a liquor advertisement. Who else among our readers will join the "band" with Dr. Miller and myself as above? We learn from the *American Issue* that it was stated at a recent editorial convention at Manhattan, Kansas, that only 61 out of the 783 newspapers and periodicals in the State will publish a whisky advertisement.—A. I. R.]

MY ANSWER to that question, page 298, is that cigarette John is not worth as much as another boy just like him in all respects but the cigarette. One reason is that John has in him a deteriorating element not found in the other boy. I don't believe a boy can be quite as truthful and reliable with cigarettes as without. The cigarette seems to deaden his sensibility to the harm of being unfaithful or untruthful. [Doctor, your remarks bring to mind an incident of just a few days ago. The Lakeshore Railroad has for ticket agent at a small station a young man who smokes cigarettes while he sells tickets. This young man got my money, but the ticket he made out would never have been accepted by the conductor had not a passenger aided his befuddled brain in the matter; and then the agent had to go with me to the conductor on the train and explain why my ticket was in two pieces. If the Lakeshore Railroad has not yet decided that cigarette smokers are not fit to sell tickets, I offer it the above evidence.—A. I. R.]

As Mr. Secor seems to be gradually retiring from the post of poet-laureate for the bee-keepers, his mantle seems to be falling on Mr. Harry Lathrop, now of Calamine, Wis. See another column.

We have received several copies of the *Bulletin of Agriculture*, published by the

Central Union of Scientific Industries, of San Salvador, Central America. It is gratifying to see the apparent progress being made in bee-keeping, as well as all other branches of agriculture, in that little republic whose interests have of late become so closely identified with our own. The work is all Spanish.

We have just received from England the following, printed in tract form, from the pen of Mr. R. Hamlyn-Harris, one of the best bee-writers of Europe. It is reprinted from the *Entomologist's Record*. As it seems to cover, in very concise and reliable form, all that is now known relative to *Apis dorsata*, I give it complete. The reader can draw his own conclusion.

It is now some years since the idea was first conceived, that, by the introduction of *Apis dorsata* (known as the Giant bee of India), a valuable addition to our fauna would be obtained, yielding a larger quantity of honey and wax, and generally more profitable than our honey-bee. *Apis mellifica* and its different varieties—var. *ligustica*, var. *Carniolia*, etc. According to Dalla Torre:

Apis dorsata, Fabr., occurs in Assam, India, and Java. Var. *bicolor*, Klug, occurs in Assam, India, Ceylon, and Java. Var. *testacea*, Smith, occurs in Assam and Borneo. Var. *zonata* occurs in Assam, Celebes, and the Philippines. [The var. *zonata* also occurs in India, which is not mentioned by Dalla Torre.]

About three years ago a special enquiry was set on foot to ascertain whether or not the Giant bee of India was really a suitable subject for domestication. At that time I was permitted to look over various reports at the India Office, and all these agreed that *Apis dorsata*, mentioned generally under native names, could not be domesticated, on account of its intractable character. The chief points noted are:

1. It is said to be exceedingly vicious, often attacking man or beast on the smallest provocation. 2. It preserves the same habits and appearance wherever its habitat. 3. It has never been known to build its nest under shelter, but mostly on isolated lofty trees or overhanging rocks. After the honey season the bees will desert their nests, and often travel for long periods and great distances, even crossing such mountain chains as the Nilgherries in their course. 5. They build single combs. 6. And are used to approach from north, south, east, or west. They rarely remain in one locality for more than three weeks, emigrating as flowers become scarcer.

We will consider these points more in detail, to make the subject better understood. Among the hill-men, near Darjeeling (Eastern Himalayas), this bee is known by the name Cargo, and is generally an object of fear and dislike, according to Sladen. It will be readily seen the risk of introducing such a bee, even were it possible, into a thickly populated country would be too great. Not only the hill-men of Darjeeling find *Apis dorsata* an undesirable neighbor, but all are agreed on the subject who have had any experience in the matter. Interesting, however, is the way in which the natives of the Malay Archipelago, for instance, take the comb and honey, showing much courage on their part. Perhaps, also, the *Apis dorsata* may be somewhat less dreaded in the islands than on the mainland of India. The native, having located the nest (some 70 to 80 feet from the ground, sometimes even more*), repairs by night to the spot, and after a wearisome climb, sometimes lasting an hour, with only the smoke fumes of a torch drives the bees away from the combs, which are then severed from the boughs and let down by cords to his helpers below. Such a rough-and-ready style of proceeding must necessarily provoke the bees, and stings, as one may suppose, are plentiful; still the tribesmen do not seem much concerned. It is well known that one of the greatest obstacles to the domestication of this bee is its natural wildness and its inability to settle permanently in one spot. When we consider that *Apis dorsata* usually makes its nest in wild and rocky country, remaining in one locality only so long as

flowers abound, we shall better realize why it moves from place to place, and the importance of so doing to its general welfare. Therefore we see that only by completely altering its natural habits could we hope to domesticate this bee, or bring it into use under differing circumstances from those in which it has always lived. Also on account of its size, and the power of its flight, the Giant bee will travel as much as a hundred miles before again settling down to home life.* It is not so much the honey gathered by these bees which is valuable to the natives, but the large quantities of comb they produce; the latter, being melted down into wax, forms a valuable article of industry in India. The hillmen do not trouble much about the honey, but are said to eat the young bees and larvae with great gusto.

Another great hindrance to domestication is the way they build their nests, quite in the open, entirely unprotected, and always single combs from about five to six feet in length, and about two to three feet in depth. Some fine specimens of these combs are to be seen in the South Kensington Natural History Museum. When a species of insect has been used to certain habits for endless generations—in fact, has never known any others—it will be readily understood how difficult would be the problem presented to us did we attempt to keep such a refractory creature in confinement. The only attempt made seems to have been a failure. A queen-bee was tied by a thread to a stick and placed in the hollow of a tree, and, after two to three months, a very small piece of comb was found, and the experiment proving useless, it was abandoned. Since this a writer to the last Government report says that he "had seven hives all well and fed for the winter," but in the spring the "little brutes" decamped by twenty and thirty a day, until each queen in turn left its hive in disgust. Clipping the queen's wings, as is done in modern bee-keeping, would prove fatal to *Apis dorsata*. On account of her uncontrollable character she would probably be lost. The question arises, if we can not domesticate *Apis dorsata* itself, could we by judicious crossing attain the desired end? The best answer to this question will, I think, be found in the fact that European bees exist which are closely allied to a species found in Northern India, which never crossed with *Apis dorsata*. All these facts considered, there only remains *Apis India*, very similar to our European bee, with which domestication might be a success; but if any real advantage would arise therefrom or not is doubtful; but no doubt can remain that the facts relating to *Apis dorsata* must for ever bar the way to its domestication.

It would seem from this that, notwithstanding the large amount of wax and honey which this bee produces, and which is sold so largely in India, it is incapable of domestication. This agrees substantially with what F. W. L. Sladen and others have said.

CLIPPING QUEENS' WINGS.

"Good morning, Mr. Doolittle. The sun shone so brightly, and the air seemed so springlike, that I thought I would run in a little while, and, if you were not too busy, have a little chat with you relative to clipping queens' wings."

"Yes, it is a nice morning, and looks as if spring might open up before long; but there is still plenty of time for much rough weather before the bees will be out of the cellar. But what did you wish to know about clipping the wings of queens?"

"I have never clipped my queens, and

* This is for protection against the bears, which are (as is known) fond of honey, and would climb the trees in search of it.

* *Apis dorsata* is, however, inclined to fly somewhat clumsily, and to visit flowers somewhat listlessly.

have been in doubt in the matter, as quite a few tell me that clipping does more harm than good; but after having several swarms go off to the woods last summer, I have been wondering what to do, so I came over to consult with you in the matter."

"I have always contended that, by having the wings of all queens clipped, we have the bees under the control of the apiarist and can handle them as we wish, separate them with pleasure when two or more swarms cluster together, and hive them on the returning plan when they come out singly."

"What about this returning plan? I have never heard any thing regarding it; and if there is a better plan than the hiving of bees from a limb or some crotch of a tree, I would like to know about it."

"In using this plan, all you have to do when a swarm issues is to step to the entrance to the hive with a little round wire-cloth cage; and when you see the clipped queen running around in front of the hive hopping about, trying to fly, put the open end of the cage down before her, into which she will immediately run, when the cage is stopped and laid in front of the hive."

"What, don't you have to pick her up and put her in?"

"No, not at all. If you will watch her a moment before you let her run into the cage you will see that she is all the time trying to get something to climb up that she may better take wing, as she thinks, climbing up any little pebble, chunk of dirt, or spear of grass, etc.; and on your holding the cage in front of her she will use the cage for the same purpose, and you are to put in the stopper while she is climbing to the top."

"Well, that is easy, sure. I thought I had to pick her up, and was afraid I should hurt her, and that was one of the reasons I doubted in the matter. But I interrupted you about the plan. Go on from where you left off."

"Having the queen in the cage in front of the hive, the old hive is now moved to a new stand, and a new hive, all fitted and fixed in readiness for the swarm, is set in its place. In a few minutes the bees miss their queen, and, as is always the case where any queen can not accompany the swarm, in a few minutes the bees come back, running into the hive with fanning wings, telling, as plainly as can be, that they are rejoicing over finding their queen. When about two-thirds are in, the stopper is taken out of the cage and the queen allowed to go in with them, the same as she would have done had you cut down a swarm from a tree."

"Is it as simple as that? How long have you followed that plan?"

"I have followed it for over thirty years, and know it to be a good one, and as good a yield of honey is the result as can be obtained by any plan where swarming is allowed—no climbing of trees, cutting of limbs, or lugging a cumbersome basket or swarming-box about. It is so straightfor-

ward—remove the old hive to a new stand, put the new hive in its place, and the returning swarms hive themselves without trouble, except the releasing of the queen."

"Have you any other reason for clipping the queen?"

"Yes. In clipping I cut the most of all of the wings off so that she is always, after that, very readily found. In making nuclei, changing frames of brood and bees, etc., if you find the queen you can always know that she is just where she belongs, and not in some place she ought not to be, where she will get killed, or where you do not wish her. By having her wings cut short, you can see her golden abdomen at once, upon glancing over the frames as you lift them."

"Well, I should think as much of this part as of any of the rest, it seems to me, for it does bother me so to mind a queen; and I now believe that, if the wings were off, I could much more readily find one. Have you any other reason why you clip?"

"Yes, I have not as yet touched on the main reason for clipping, which is the loss of swarms by 'running away' to the woods. Having the queen clipped, even if your bees do start off for the woods or some old hive or open place in a house, you can always rest assured that they will come back again as soon as they miss the queen, and run into the hive fixed for them, the same as did the swarm we first spoke about. Your own experience has taught you what the loss of swarms going to the woods means; and if you had had the wings of those queens clipped last summer, you need not have lost a single one of those which went off."

"If that is so, that settles the matter with me. I will try clipping a part of mine this spring, in any event, and then a trial will tell me which I like best."

"I am glad to hear you talk like that, for that is the way all new plans, or those new to us, should be tried; for it often happens that what suits others does not always suit us. By trying the plans of others on a small scale at first, we are soon able to tell whether they are to our liking; and if they are, we are then ready to adopt them for the whole apiary; and if they do not suit we are not much out for having tried the matter in a limited way. But you can not very well help liking to manage an apiary having the wings of all the queens clipped."

"I judge that I shall, but I must be going now."

"All right! I am glad you called. But before you go I wish to tell you something else you can do with a swarm having the queen clipped. I do not believe in not having hives all in readiness for swarms when they come; but in case of emergency, if the queen is clipped you can hold a swarm out on a limb while you make a dozen hives, or all summer if you wish. If you ever wish to do this, as soon as you have the queen in the cage attach a short piece of wire to the

age; and as soon as the bees begin to alight, bend this piece of wire over the limb, so the caged queen will hang where the cluster will naturally be, when the swarm will alight and cluster the same as they would had the queen not been clipped. You can now go about any thing you may wish to, making hives or any thing else, resting assured that you will find the bees there when you are ready to take care of them, no matter if it is not till the next day. If they should go off they will come back to the limb as soon as they find their queen is not with them, and cluster there again, as I have had them do when conducting experiments along this line, I even holding them thus until they had started several combs, evidently concluding to make their future home on this limb. I at first thought, when they started off so, that they would return to the parent hive on coming back, instead of seeking out the limb; but the queen is of all-absorbing consequence to any swarm, and so they come back to her every time."

THE subscription-list of GLEANINGS continues to grow apace, for which we are very grateful.

REPORTS in regard to wintering are unusually favorable this spring, notwithstanding the winter has been very severe in many localities.

WATCH your State Legislature during these closing days. Some bills are liable to be rushed through; and if you do not look out, some of them may hurt your business.

IN our issue for March 15, page 227, I referred to the fact that a bill had been introduced in our Ohio Legislature, classing sweet clover as a noxious weed, and requiring it to be destroyed by the township trustees. We sent out something like 1000 circular letters to our subscribers in this State, besides personal letters to some of our Representatives and Senators, and now we have the practical assurance that the bill will be pigeonholed in committee, and the present session of the Ohio Legislature is drawing to a close.

GIVING INDOOR BEES A CLEANSING FLIGHT, AND THEN PUTTING THEM BACK IN THE CELLAR.

THE bees in our bee-cellars have wintered nicely. The larger portion, as will be remembered, were in our home cellar, comprising nearly 300 hives, and these, many of them, two and three frame nuclei; and yet they came out bright and healthy.

One or two nuclei succumbed, but they were very weak.

During the last days of March there was considerable roaring among the bees, and it seemed necessary to quiet them down. Mr. Wardell finally suggested taking them out on the first warm day and giving them a flight, and then returning them. This was done with the bees in both cellars, and the results were eminently satisfactory. In our first trial test, we took out 25 or 30 colonies, that were quite uneasy. We gave them a flight, and put them back, and, presto! they were quiet, while those that had not had a flight were uneasy as before. These were put out, and they too became contented.

I believe it has been stated that it is a waste of time and labor to give indoor bees a flight during mid-winter or early spring; but our own experience does not seem to prove the statement.

When we put the bees out in the first place we numbered and marked their location, so that in a month hence when they are put out again they will go back in exactly the same places.

EXPERIMENTS IN MEASURING THE TONGUES OF BEES AT THE MICHIGAN EXPERIMENT STATION, LANSING.

We have been favored with extracts from a bulletin about to be issued from the Michigan Experiment Station on the subject of measuring bees' tongues. They are as follows:

REPORT OF 1897, PAGE 128.

A great many queens have been bred for the purpose of testing the question whether a strain of bees could be produced which would be characterized by long tongues. The tongues of several bees of each colony were measured, and were found to average as follows: Black, 4.2 mm.; hybrid, 4.9 mm.; Italian, 5.2 mm. One colony of Italians was found whose tongues measured 5.3 mm. The drones from this colony were allowed to fly at will, and the others were kept down. As a result we have in the yard at the present time one queen the tongues of whose progeny measure 5.41 mm.

This result is very encouraging and leads us to continue the experiment.

REPORT OF 1898, PAGE 141.

The continued experiment on bees' tongues did not make such marked progress as it did last year. At the beginning of the season the longest tongues in the yard measured 5.41 mm. One direct cross was made; but, owing to the large number of drones from common stock in the surrounding country, no other queens were satisfactorily mated. The bees from this cross have made a gain of .9 mm., and now measure 6.31 mm. The experiment will be continued.

REPORT OF 1900, PAGE 90.

The continued experiment on lengthening the tongues of the bees so that it will be possible for them to reach the nectar in such flowers as June clover, has been carried on with little success, the average lengths of the tongues of those colonies under experiment being no longer than a year ago, the principal difficulty seeming to be the failure of the desirable mating of queens. When this difficulty can be overcome it may be possible to breed a strain of bees superior to any thing now known.

There seems to be, from the above, quite a variation, all the way from 4.2 millimeters in blacks to 6.31 millimeters in Italians bred by selection. These figures, converted into hundredths of an inch, stand respectively 17 and 25.

I do not know what these measurements

refer to, although I assume they relate to the whole tongue-length and not to the tongue-reach. At all events, the experiment shows a great variation, and gives us some encouragement that we may be able to accomplish something providing we can control the male parentage.

NEW YORK'S RECENTLY ENACTED ANTI-BOGUS-HONEY LAW.

IF there is a bee-keeper anywhere in the great State of New York who works unstintedly and unselfishly for the industry of which he is a representative, it is Mr. W. F. Marks, of Chapinville, President of the New York State Association of Beekeepers' Societies. The great city of New York has been headquarters of late for bogus honey. Every thing would pass muster in that great metropolis, and then would be scattered far and wide.

Some little time ago I asked President Marks if it would not be possible to get a law that would better protect bee-keepers. He immediately wrote back that the matter was under consideration, and that he himself would do all he could to get the law amended. The following letter from Mr. Marks, dated March 24, will fully explain itself:]

Mr. E. R. Root:—I hand you herewith a copy of our new anti-bogus-honey law, or as much of it as relates to honey. You will observe that the provisions relative to honey are the same as in the original draft, except the words "strained honey," which were added before the bill was introduced. The duties of the commissioner, and penalties for violation of the agricultural law, were already provided for in other sections of said law, abstracted from which are annexed thereto.

It passed both branches of the legislature, without amendment. I received word from Albany Saturday that it had been approved by the Governor. The act takes effect immediately. The Hon. Jean L. Burnett, of Canandaigua, who secured the passage of our foul-brood law, introduced and had charge of this bill.

Our slogan is, "Human foods should be sold under their proper names; misbranding is a fraud; honey is the natural product of the honey-bee; and the word 'honey' in any form must not be used as a brand for glucose, syrups, and cheap compounds." Chapinville, N. Y., Mar. 24. W. F. MARKS.

The text of the amended sections of the law is as follows:

AN ACT to amend the agricultural law relative to prevention of disease among bees, and to add two new sections thereto relative to honey, to be known as sections eighty-a and eighty-b.

Section 2.—Said chapter, three hundred and thirty-eight, is hereby amended by inserting therein, after section eighty thereof, two new sections, to be known as sections eighty-a and eighty-b, and to read respectively as follows:

Section 80-a.—*Defining honey.*—The terms "honey," "liquid or extracted honey," "strained honey," or "pure honey," as used in this act, shall mean the nectar of flowers that has been transformed by, and is the natural product of, the honey-bee, taken from the honey-comb and marketed in a liquid, candied, or granulated condition.

Section 80-b.—*Relative to selling a commodity in imitation or semblance of honey.*—No person or persons shall sell, keep for sale, expose or offer for sale, any article or product in imitation or semblance of honey branded as "honey," "liquid or extracted honey," "strained honey," or "pure honey," which is not pure honey. No person or persons, firm, association, company, or corporation shall manufacture, sell, expose, or offer for sale any compound or mixture branded or labeled as and for honey which shall be made up of honey mixed with any other substance or ingredient. There may be printed on the package contain-

ing such compound or mixture a statement giving the ingredients of which it is made; if honey is one of such ingredients it shall be so stated in the same size type as are the other ingredients; but it shall not be sold, exposed for sale, or offered for sale as honey; nor shall such compound or mixture be branded or labeled with the word "honey" in any form other than as herein provided; nor shall any product in semblance of honey whether a mixture or not be sold, exposed, or offered for sale as honey, or branded or labeled with the word "honey," unless such article is pure honey.

ABSTRACT FROM THE AGRICULTURAL LAW RELATIVE TO PENALTIES.

Section 37.—Every person violating any of the provisions of the agricultural law shall forfeit to the people of the State of New York the sum of not less than fifty dollars nor more than one hundred dollars for the first violation, and not less than one hundred dollars nor more than two hundred dollars for the second and each subsequent violation. When such violation consists of the manufacture or production of any prohibited article, each day during which or any part of which such manufacture or production is carried on or continued, shall be deemed a separate violation of the provisions of this article. When the violation consists of the sale, or the offering or exposing for sale, or exchange of any prohibited article or substance, the sale of each one of several packages shall constitute a separate violation; and each day on which any article or substance is offered or exposed for sale or exchange shall constitute a separate violation of this article. When the use of any such article or substance is prohibited, each day during which or any part of which said article or substance is so used or furnished for use, shall constitute a separate violation, and the furnishing of the same for use to each person to whom the same may be furnished shall constitute a separate violation.

Section 2.—This act shall take effect immediately.

I have read over this law, and I can not imagine how any thing can be more specific or more sweeping. If the officers whose duties it is to enforce this law perform their duty at all, the whole State of New York will be very largely, if not wholly, free from the adulteration of honey.

The time was, not more than three or four years ago, when Chicago was the head center of adulteration, simply because there was no anti-adulteration law that could be made sufficiently effective. But a law was finally passed, so that to-day in Chicago scarcely a pound of adulterated honey can be found unless properly labeled; and such goods, of course, will not sell.

We are now looking forward to a similar result in the city of New York; and you may rest assured that W. F. Marks and the various members of the society with which he is connected will leave no stone unturned to bring about a proper enforcement of the law above given.

Ohio has a good law against the adulteration of food products, and it is well enforced. If we can get a few more States to go and do likewise, bee-keepers will begin to see a rise in price of honey.

California had a good law; but those whose duty it was to enforce it have practically taken the teeth all out of it, so that it is only partially effective. If our friends on the west coast can get a law such as there is in Illinois, Ohio, and New York, and get some men back of it who will see that it is enforced, we shall get this adulteration business pretty well corralled. As the matter now stands, there is nothing to prevent carloads of honey in California from being adulterated with glucose, and

then being sent East; but, thanks to our New York friends, they would not be sending any more such goods into the State of New York without getting into trouble.

THE BEE AND PEAR-BLIGHT; THE SITUATION IN CALIFORNIA.

OUR readers will remember that trouble arose last summer between the pear-growers on the one side and the bee-men on the other, in the vicinity of Hanford, Cal., a great fruit-growing region near the center of the State. The first mentioned alleged that the blight that was killing their trees was scattered by the bees, because the microbes causing the disease, and which they claimed was in the nectaries of the flowers of affected trees, were scattered by the bees to the nectaries of flowers of healthy trees. In this contention they seem to be sustained by one or two scientific men of some prominence.

As a member of the National Association I appeared at the scene of the trouble in behalf of the bee-keepers. The result of our meeting was that a compromise was agreed on, by which, for the purpose of experiment, all bees in a given vicinity were to be removed by the bee-men voluntarily for one season, to determine whether the spread of pear-blight could be mitigated.

When I left, there was good feeling; but in the mean time there have been various stray shots fired back and forth at different times. The pear-men, in two or three instances, accused the bee-keepers of bad faith, but unjustly, as I know from facts in my possession.

A month or so ago a statement was broadly scattered throughout the East, to the effect that Mr. Downing, near Hanford, one of the largest if not the largest pear-grower in California, had stated in a public meeting that there were certain counties in the Eastern States where it was unlawful to keep bees within five miles of a pear-orchard. As I had met that gentleman, and had a very pleasant chat with him, I immediately sat down and wrote him, asking him to give me the names of the counties and States in which such laws or ordinances were in effect. At the time of doing so I sent a copy of that letter to Mr. Brown, President of the Central California Bee-keepers' Association. The latter immediately, on receipt of this, it appears, wrote Mr. Downing, asking for information.

At the time of sending this letter Mr. Brown sent one to me, which reads as follows, and which explains the final outcome of the situation:

Mr. E. R. Root:—I have your letter of March 18 regarding the published statement of Mr. Downing, where he said that he knew of places in the East where it was unlawful to keep bees. Mr. Downing made this statement before a mass meeting in the Superior Court room in Hanford, at which I was present. I at once called for the particular State and county, but he was unable to give it. I then called for the source of his information, when he stated that his brother had just arrived in Seattle, and that a man there had told him that he had a letter from his friend

somewhere in the East to the effect of the law as above referred to; so you will see it is only hearsay, and I have no faith in the matter whatever; but as soon as we can find out for sure that he is publishing only hearsay, then I think the statement should be published as it is, setting forth Mr. Downing and his statement in a true light. His statement as to \$10,000 loss in pears is another exaggerated remark, I think, but I have no means to disprove it.

The way the bee and blight question was settled is this: The two committees came together on February 22, and, after much deliberation, mapped out a section two miles square, as a matter of test, and agreed to move our bees three miles from the two-mile line, and left it to the fruit-men to see that all the bees that belonged to the fruit-men, and a farmers not in the Association, be moved. This they agreed to do, but they are not succeeding, and it will spoil the test.

Some are complaining of poison, but I am not yet sure that poison has been put out this spring, although last fall there was. We gathered up some of the bees and had them analyzed, and it was reported that they were poisoned by arsenic.

California has had plenty of rain for another big crop, and I am afraid that the market will begin to weaken at the first report of new honey; and should Southern California not get in position to hold the bulk of the product until as late as August or September, then I can not see but we still have repeated the same results as we experienced last season.

Hanford, Cal., Apr. 2.

F. E. BROWN.

There is a possibility that bees carry the virus of pear-blight. If they do, all kinds of insects that are so abundant in California, that visit the flowers, are helping to do this mischief. It has been contended by us all along, that, even if all the bee-men were to remove their bees from a given locality, there will be large numbers of wild bees, so to speak, in the rocks and in trees, that are wholly beyond the control of man. These alone would be sufficient to cause all the trouble. But suppose all the wild bees as well as the tame ones could be removed; there would still be hordes of insects that would scatter pear-blight.

But a most significant fact against the theory that bees are the sole means of conveying the virus from tree to tree while in bloom is this: Young trees that have never been in bloom—acres and acres of them—were fearfully blighted last summer. Our committee called the pear-men's attention to this, and asked them what explanation they had to offer. One of them said, "I think that bees crawl all over these young trees." Some bee-keeper offered to give him five dollars for every bee he could find crawling around on those little sprouts sticking out of the ground, on which there had never been any bloom.

Later.—Since writing the foregoing, a letter has been received from President Brown, inclosing one from Mr. Downing, who, under date of April 3, writes:

Mr. F. E. Brown. Dear Sir:—In answer to your letter of the 2d inst., and in order to give you fully what information I have regarding the subject mentioned, I inclose herewith a letter received from Prof. Buckhout, of the Pennsylvania State College, which will show that, whereas I was given to understand that the laws referred to had already been passed, they have up to the present time been only proposed.

Armona, Cal.

CHAS. DOWNING.

The letter from Prof. Buckhout was not inclosed; but from the admission of Mr. Downing there are no such laws as he is reported in all the papers to have said were in existence. Will those same papers now give the correction?

THE ALLEY vs. THE DOOLITTLE METHOD OF QUEEN-REARING.

Grafting Queen-cells; is it True that Artificial Cell Cups Cause Queens to Fail?

BY ARTHUR C. MILLER.

Some time ago I stated that the Alley system of queen-rearing was superior to the cell-cup plan; that the latter, except in the hands of a skillful manipulator, was likely to produce many inferior queens. Dr. Miller and some others questioned the correctness of my position, and the doctor called for my reasons.

A careful perusal of the bee-papers will, I think, plainly show a very noticeable increase in the number of reports of "missing queens," "superseded queens," "failing queens," etc., since the introduction and extensive adoption of the cell-cup plan. It is but fair to presume that part of the increase in such reports is due to closer observation, but that can not be accepted as the reason of the whole of the increase. A part of such reports may be attributed to queens injured in transportation by mail; but even with such allowance there still confronts us an increase which seems to be inexplicable unless a large number of the queens produced in the last few years are inferior to those produced previously. Is or is not that the case? During the past six years the cell-cup plan has been exploited far and wide, and with scarcely a warning word. The system was put forth as being one which would enable us to approach more nearly "Nature's way," but does it?

Under natural conditions a queen lays an egg in a cell. For three days the embryo in this egg grows, the nourishment for the forming larva being the vitellus, or yolk. On hatching, it receives a food prepared in the stomach of the nurse-bee, consisting of honey and pollen acted on by the digestive secretions of her body. If the larva is destined to become a worker it receives such food for approximately three days, after which a gradual change takes place. According to Dr. A. de Planta's analysis, the solids in the food of the worker larva, before the fourth day, consist of albumen 53.38; fatty substances 8.38; sugar 18.09 per cent. After that time the proportions of the same elements are respectively 27.87, 3.69, and 44.93 per cent—a very decided change. According to the same tables a larva destined for queen receives of albumen 45.14; fatty substances 13.55; sugar 20.39. These figures are taken from Mr. Cowan's book, "The Honey Bee," page 123. Mr. Cowan also quotes Dr. de Planta as saying that, for the first three days, the food of queen-larvæ is the same as of the

worker larvæ for the same period (p. 122), and that "queen larvæ were fed the same food during the whole term of their existence." There is a discrepancy here which needs investigating. What I desire to impress on the mind of the reader is that, with each varying stage of the development of the embryo—that is, from the commencement of the incubation of the egg until the larva spins its cocoon, there takes place a change in the proportions of the elements of the food. It is of vital importance that these changes occur at the proper time if the embryo is to develop normally. It should be borne in mind that the larval bee is as truly a developing embryo as is an unborn mammal.

Now, if we take a worker larva two or three days old and transfer it into a mass of "royal jelly," we suddenly and violently change the conditions necessary to its proper development. Recently it has been shown that, soon after these transferred larvæ are given to the bees, all traces of the "royal jelly" are removed, and that for a greater or less period these larvæ are without food, which is to be considered as another shock to the developing embryo. Other factors against the transferring system are the danger of touching the larva with the transferring spoon, the chilling, or the exposing to hot, dry air the delicate organism. Now, while the transplanted larva may survive all this, and may develop into a large fine-looking queen, it is not the slightest proof that she is perfectly developed or constitutionally strong. Judging from analogy it would be more likely that she was defective or of weakened constitution. The increased reports of "failing," etc., queens, seems to sustain this contention.

There are two other factors which should be alluded to before leaving this part of the subject. The first is that, in the hands of the *average* manipulator, larvæ *over* rather than *under* two days old are used. Many persons seem unable to judge correctly of the age of a larva by its appearance. The second is that, by the Pridgen method of transferring the "larva, cradle, and all," there is less chance of incurring several of the before-mentioned evils.

One feature of the cell-cup plan has been exploited as most valuable, whereas it is the most dangerous. I refer to the claim that cells so started can be handled more readily and with greater safety. A more harmful and dangerous propaganda can scarcely be imagined, for it engenders careless treatment. The cells containing the young queens should be handled as if they were made of spun glass.

In regard to the rearing of queens in upper stories, Mr. Alley has this to say: "I long ago discontinued rearing queens, or, rather, having cells finished in upper stories. Queens so reared, except in the flush of the honey-flow, are as worthless as flies." Why this is so, it is difficult to say, but presumably it is due to the larvæ

not receiving proper food at the proper time.

With the Alley system, as now practiced by that veteran, either eggs or larvæ not over *six hours* old are used—a practice as close to “Nature’s way” as at present seems possible. Recently Mr. Simpson objected to Mr. Alley’s use of a *match* for destroying larvæ in the alternate cells, on account of the brimstone. As I understand it, Mr. Alley uses a match simply because it is a handy bit of wood with a smooth, rounded end; and as he uses the hard-ended “parlor-matches,” no brimstone or other deleterious substance is left in the cells to be removed by the bees.

The cell-cup plan has much against it and little in its favor. It requires much time and the most delicate manipulation, and at its best is surrounded with many dangers. The Alley system is safe, simple, easy of operation, and if the results achieved by the most careful and observant members of our profession are any criterion, it must be acknowledged that the Alley system produces uniformly better queens than any other system that has as yet been tried.

Providence, R. I., Feb. 25.

NUCLEI MANAGEMENT.

The Swarthmore System any thing but a Success; an Experience.

BY QUEEN-BREEDER.

I struck the Swarthmore system of “nuclei management” with a full head of steam on, May 25, 1901. The season in this locality was very backward, with cold winds and rain almost daily up to June 1, and I lost several colonies of bees in wintering; and this led me to take an interest in the article in the May 15th number of *GLEANINGS*, page 434, which showed in such a plausible way how to fertilize queens in nucleus colonies with so little expense in bees, time, labor, care, etc., that I became a convert to the system at once. As I had never before tried to get queens fertilized in less than three or four frame nuclei, this system was, therefore, entirely new, and so I determined to follow the details *very* carefully.

I have had no experience with Swarthmore’s system of queen-rearing up to the time of the hatching of the queen, as I have my own method, which I prefer to all others, and the same I suppose is true of all queen-breeders.

I had about 380 fine cells due to hatch June 1st; and May 25 I had prepared 42 frames, $8\frac{1}{2} \times 17$ inside measure, each holding 8 section boxes $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$, with foundation starters. In sets of seven each these frames were placed in eight-frame hive-bodies—56 boxes in all to each body, all having been previously fitted with covers with zincs, flight-holes, etc.—covers, of course, being left off for use later on.

Now, here comes up the first query in practice, and not explained in the Swarthmore article referred to. I am directed to hive a good-sized swarm (natural or forced) into a hive-body, etc. I don’t happen to have a natural swarm at this time, so I must hive a forced one. Whence shall I obtain it? I have several full colonies in fairly good shape to meet the full honey-flow which I am expecting soon, and which has, in fact, already commenced—a rather bad time to remove bees; but I have started in, and I will see it through, so I select a full colony. Of course, it won’t do to drive out *all* the bees and queen, so I set a full colony to one side and in its place put the hive-body with 7 frames as above. I now brush from the frames of the old colony as many bees with the queen as I can without too much depopulating the parent stock; and these with the field bees give me a strong colony. I do the same thing with five other colonies, and await results. Although honey is coming in I want to be on the safe side, so I give the bees half a pint of sugar syrup with a Boardman entrance-feeder, nightly. Honey is now coming in quite freely from dandelion and other sources.

Now, Swarthmore says that, in a few days, a good prolific queen will have filled these little combs with eggs, so on the 28th I take a peep into a colony. On the first frame, north side, I find about half of the combs partly drawn out, with upper rows of cells filled with honey, and capped. The other half of combs are in various stages of advancement, some being without honey, others with the cells partly filled and not capped, but none containing eggs. The next three frames are in about the same condition, with a larger percentage of capped cells, but no eggs. In the three remaining frames I find the combs with honey in the upper portion, and eggs in the cells not filled with honey.

The remaining five colonies are in about the same shape, which is evidently not the exact condition for forming nuclei *a la* Swarthmore, so I think I will wait a little until the queen takes a notion to deposit some eggs on the north side, when all will be well; so I close the hives until the following day, when I open for inspection the one first examined the day before. On frame No. 1, north side, I find several eggs in each comb. On No. 2 I find the queen attending strictly to business, and eggs in every available cell. Nos. 3 and 4 present about the same condition. The three remaining frames which contained eggs the day before haven’t a single egg, but are either empty or partly filled with honey. Ye shades! Where’s Swarthmore, Dr. Miller, Doolittle, Alley, Root—somebody who knows more about this business than I do?

Well, if this kind of thing continues I certainly shall not have the nuclei in proper condition for queen-fertilization by June 1, so I do the only thing that suggests itself. I go to full colonies, and remove as many frames of honey as can be spared,

and give these to the forced colonies. I spread the brood-nest of the *full* colonies, and fill the empty space with frames of section boxes with foundation starters as before. I also remove from the *forced* colonies all boxes containing eggs and honey, and place them for safe keeping with the parent stocks. By thus manipulating I succeeded in getting, by May 31, 336 section boxes with eggs and honey; but this was done, of course, at the expense of breaking up and seriously disturbing several full colonies, and the end is not yet. The next step is to people these boxes with bees and queens. I have six queenless colonies of the parent stock spoken of above, and think these will be just what I want; but upon inspection I find that, if the boxes are peopled from these colonies alone, it will take all the bees, and ruin the colonies, unless I give them only one frame each; but this will require 42 queenless colonies; two will require 21, etc.

Hi, there! Swarthmore, *et al.*, come to the rescue! I refer to the article in question for light. I find this: "Then hang the frames in the hives of such bees as you may have just used in getting a batch of cells or any queenless and broodless bees you may have at the time." Now, the fact is I am quite particular *not to have* a colony of queenless and broodless bees in my apiary at this season of the year (I rear my queens by the supersedure method in upper stories, and three or four of these will furnish me with 1000 to 1500 queens in a season). I finally removed all frames from the original six colonies, and put in their place the section-box frames, giving five frames to each—all that can be accommodated after the covers are on. I dequeen two more colonies, and give five frames to each. The two remaining frames I place in the upper story of a supersedure colony by way of experiment, with the result that the queens that hatched in these latter section boxes were promptly killed by the bees. Before placing the section boxes in the various hives I adjusted a selected queen-cell to each comb. On the afternoon of June 1 I inspected and found queens in nearly every one, supplying such as had failed to hatch, or were not up to the standard of vigor, with a strong active virgin queen.

The boxes now had each a queen and a full complement of bees. These were to remain five days, according to Hoyle—I mean Swarthmore. In the mean time a little sugar syrup was fed each day. On the fifth day, the weather being unfavorable, the bees were not disturbed until the following day when all were removed to stands some distance from the parent stands, and fastened to stakes as illustrated on page 436, but with four flight-holes on each side instead of three. Going over all carefully I found four dead queens, which I replaced. Toward evening I opened the flight-holes as directed; and, as the next few days were pleasant, I watched developments.

To be Continued.

AN EXPERIMENT AND APPARENT RESULTS.

Made a Successful Attempt in Curing Foul Brood with Sulphur Smoke.

BY T. F. BINGHAM.

About the beginning of the buckwheat honey-flow last season a very full colony sent out a prime swarm which was given one of my fractional hives full of clean empty combs, but no honey below it; two fractional hives with full sheets of heavy foundation; room enough, but none to spare. The queen, though an old one, stowed in the eggs, and soon the full combs were filled with new honey and brood, and the queen passed down to the new combs, and, after filling them, gave out, and the bees reared a new one, and matured the brood so that very little was left to develop, but a fine colony occupied the entire hive. Mr. Hetherington was at my place, and I wished to show him my first buckwheat colony. When opening it we found a non-laying queen and a few black dead larvæ scattered at intervals among the empty cells when, evidently, the brood had just matured. Mr. Hetherington said there was no doubt that the dead brood was such as had made trouble in Eastern New York. It filled the description given in the journals so far as we could decide. I told him I would try an experiment, and watch results. I gave them an unfertile queen five days old; and when darkness came I smoked the bees, thoroughly at the entrance, and at the top of the hive, and at the two joints between, with pure sulphur smoke. The following night I gave them the same treatment, but stopped the exits from the hive and compelled the bees to stay a while. Just as the young queen had begun to lay, Mr. H. was again at my place, and, of course, we examined the first prime buckwheat swarm to see if the combs had still in them evidence of disease. Nothing could have been cleaner or in better order. The question, so far as cleaning out the few dead larvæ was a factor, was complete. One factor, however, remained; viz., would the disorder develop again? I kept watch of the brood, and nothing could have been finer or more abundant. The queen laid abundantly till the flowers failed, and no signs of weakness or dead brood appeared.

The query will naturally arise, "Was the sulphur smoke the cause of the change?" The reason I have given this experiment publicity is because I am not likely to have an opportunity to test the experiment again; and while I do not like to say much, based on a single experiment, others may find it of value.

When at Thompsonville, at the Michigan State Bee-keepers' convention, and The A. I. Root Co. was represented, and Mr. Hutchinson and Mr. Hilton and Mr. Rankin and many others not so largely known were present, I stated to the convention that I thought it reasonable that sulphur smoke

would do more to arrest and control foul brood than any thing that had been tried.

The prejudice or superstition is so marked and general that the only thing to do was to stamp out, on the old plan of cremation, any signs of trouble, that little discussion followed.

Undoubtedly those who were there had never read of such a method, and acted with usual caution, and on the motto that it is better to suffer wrong than to do wrong. The treatment would be regarded as under the head of cruelty to animals, by many. The future, as in the past, may demonstrate that sulphur smoke as a disinfectant or spore-destroyer has no equal, and is as applicable to bees and combs and hives as to pest-houses, etc.

I may remark here, that sulphur smoke does not kill bees if allowed fresh air soon after it is applied. The odor, however, remains in the hive and among the bees for several days, but in no way disturbs their general actions. The smoke should be applied at night after the bees are mainly quiet, so that they may recover in time for the morning's duties.

If sulphur smoke will kill germs and spores it may also kill eggs, and work more injury than might be expected. My experiment was free from eggs and larvæ, and could not be regarded as a test in that sense.

I shall test the effect on eggs and larvæ that have no disease. If it will dry up dead brood and immature larvæ, foul brood and similar disorders will lose their terror.

It is well known that bees will not remove gelatinous substances from their combs, and it is probable that they would not dry matter, except to accommodate immediately the instinct to produce brood.

Farwell, Mich., Feb. 24.

[Sulphur smoke is a strong germicide; but I should question whether it would kill the *spores* of foul brood, especially if those same spores can resist the temperature of boiling water for an hour or more.—ED.]

ALFALFA IN KANSAS AND NEBRASKA.

How it Yields Honey in Unirrigated Lands.

BY CARL F. BUCK.

Mr. Editor:—On page 179, March 1, in one of Dr. Miller's Stray Straws, you and he both claim that alfalfa does not yield honey except on irrigated land. This Straw is surely a stray. I don't know what we would do if not for our alfalfa. Last year our fruit-bloom and alfalfa were our only honey-plants, and my bees averaged between 35 and 40 lbs. surplus per colony; besides, I sold many nuclei and queens from my 192 colonies, spring count. This honey was all gathered from alfalfa in the short time of about two weeks. After this we had the great drouth, and our fall flowers did not furnish any honey to speak of. Not

only does my locality furnish alfalfa honey, but so does all the bottom lands along the Arkansas and Kansas Rivers and tributaries. Two years ago I purchased 150 colonies of bees in Chase Co., on the Cottonwood River. These bees were located in large alfalfa-fields. When examining the bees I found they had produced large quantities of alfalfa honey, and they were not cared for at all. They were in all kinds of cheap hives, some open at top so wide one could put his fingers in; covers warped, etc. The manager reported that he had lost at least 40 colonies that spring by spring dwindling. Should this apiary have been run with Danz. hives, that have no such cracks as above hives, and been cared for as they should, I see no reason why this locality would not have yielded over 100 lbs. per colony surplus from alfalfa only, besides some other flowers on the bottoms and prairies.

Alfalfa does not seem to do much good in Missouri, Illinois, and other more eastern States; but in Nebraska, Kansas, Oklahoma, and Indian Territory alfalfa on the bottom lands does yield honey, in some quantity at least, and in many localities it yields it in abundance—but, of course, not like the irrigated districts of Colorado and other western States. Come out here some time, Mr. Editor, about June 1st to 15th, and I'll prove to you that our alfalfa does yield honey. I might add that our locality, Butler County, is now overstocked, so we don't ask any H. O. G. to come in. You see, only just here and there are these alfalfa-fields, so there is no large number of colonies in one location.

Augusta, Kan., Mar. 22.

[Thanks for your invitation. The next time I make a general tour westward I'll stop in your country.]

I had always supposed that no nectar was secreted from alfalfa in unirrigated lands.—ED.]

DAD'S ADVICE.

BY HARRY LATHROP.

Now, Lewis, when you see a maid
With face so very pretty,
Just think of that old maxim true,
And this my little ditty.

"Handsome is as handsome does,"
Nought repays the one who loves
But the worth of heart and mind,
These with beauty well refined.

To the lover's eager eyes,
Beauty may her faults disguise,
And the plainer face reveal
That which dress may not conceal.

Plainest surface may but cover
That most worthy of a lover;
Let each merit have a portion
Of your heart's sincere devotion.

If you follow my direction,
Kindly given for your protection,
You perchance may sooner find
Beauty, strength, and worth combined.

Then when you have made selection,
Love may not avoid detection;
What to say, I will not mention,
That must be your own invention.

RAMBLE 200.

A Visit at W. W. Somerford's; More Troubles with Spanish; Calzadas; Scenes on the Train.

BY RAMBLER.

Before coming to Cuba I had some correspondence with Mr. W. W. Somerford in relation thereto. In fact, Mr. Somerford was the first person to put a Cuban bee in my hat; and now being on Cuban soil Mr. S. was one of the first bee-keepers for me to find outside of Havana. Caimito, his home, is 20 miles west of Havana. Mr. Craycraft gave me full directions to find him. First, take the train ten miles to Marianao, then by stage. There is a little bit of a twist in the pronunciation of all of these Spanish words, and Marianao is not an exception; and the more I repeated it the more it became "Marry-me-now;" then my horror increased when I found the station filled with ladies of all colors and sizes. In order to proceed it would be necessary to ask questions. I asked a policeman the way to Marry-me-now. He evidently didn't know, for he shook his head and said, "No sabe." I exhausted all the resources in the male line, and then desperately turned to the ladies. It was "no sabe" here too; but they were kinder than the men. I had asked the way to Marry-me-now, and clustered

around until a petite jewel of a woman took interest in the matter, and remarked, in good English, that I was evidently on the wrong line; that Marry-me-now lay through the priest's office, and the price of the ticket was from \$20 to \$40.

Well, the good lady set me right, and in the brief visit I learned for a wonder that her name was Brown—widow Brown—of Matanzas. She has a place out there, splendid for bees, and for rent, at \$100 per month; and as the train pulled out, the matter was left open for further negotiation. There is no knowing what will come of that slip from Marianao to Marry-me-now.

I discovered various new things on this little journey. One of them is, that there is not much of a color line here; and although there is a first, second, and third class on the train, white, black, and creole can secure the best by paying the better rate.

Another discovery, after it was too late. Widow Brown called my attention to it. I asked for a ticket without specifying the class, and in such cases the ticket agent is sure to give you the highest-priced, and a return at that. I regretted it, for it took me to another car away from widow Brown.

After changing from rail to coach I discovered all colors here, and nearly all of the ladies were bareheaded, or with the black mantilla thrown gracefully over the head.

Nearly all the men and boys were smoking. The Cuban next to me smoked three big cigars while going that ten miles. If any one wishes to start a reform on the line of tobacco-using, Cuba offers a fine field. Women are often seen with a big cigar in the mouth.

Another thing of interest, and always under consideration in Cuba when locating an apiary, is the calzada (macadamized stone road). These calzadas lead out from Havana in various directions. This one leads 60 miles toward the west end of the island. It is marked off in kilometers, and,

"A PETITE JEWEL OF A WOMAN TOOK INTEREST IN THE MATTER."

according to my cyclometer, that means about $6\frac{1}{4}$ tenths of a mile. These stone posts, with the prominent figures, are of the utmost convenience; for instance, if we wish to find Mr. Somerford, look sharp for his apiary after passing the 29th. Turn in right at 55 to find Harry Howe; just a little beyond 85, to find Mr. Moe. The stage dropped me off at the proper place, just in the edge of the evening.

Mr. Somerford's home apiary is nicely located close to the calzada; and, Mr. S. has a helpmate and two bright little girls, and liable to get stung every day, because the hives surround the house on three sides.

The photo will give you an idea of the situation. There are over 200 colonies here, and it is a busy place at almost any time in the year. The hives are arranged in double rows, and sheds will be erected over them in due time.

At the time of my first visit Mr. S. had four apiaries and about 800 colonies. At this writing, two months later, bees are being moved and new apiaries established. Mr. S. has very large plans. His ambition now is to get up to 2000 colonies. When he gets that number there is no telling how many thousand more he will want.

He has, in certain respects, outgrown the calzada plan, and is locating apiaries along the north coast some ten to fifteen miles from his residence. Along this coast several little bays lead inland, and upon them are the apiaries. The idea is a good one, for from these points cheap water transportation can be secured. A schooner can be run to the vicinity of the apiary, and the honey loaded without the intervention of the

cart or mules or oxen. When taken into Havana harbor, other expenses are saved. All of these items count when honey is selling for only 34 cts. per gallon.

On one of these bays Mr. S. has an apiary which he termed the "Rambler's Retreat." He had an idea that I would like a real retired place in which to work bees, where I could fish and swim, and be far, far away from the wiles of the fair sex; but when I saw the location I strenuously objected to being buried alive. Said retreat is five miles from the calzada, and such a five miles of road you never saw. All of the traffic on these byways is done with big two-wheeled carts drawn by oxen; and the carting is so infrequent that the road degenerates into a mere cow-path, with the cow-path huddles, and in places rocks and stones. A bicycle can be worked over it by alternate riding, walking, and falling off; and when the rains come the road is impassable to all ordinary means of locomotion. Even on horseback there is danger of getting mired, while a pedestrian would have to carry a good share of the land off on his boots.

The bee-keeper in the States, who has an idea of coming to Cuba, must take this road matter into serious consideration. If located a mile back from the calzada it costs as much to get the honey over this mile as it does to haul thirty miles on the good road. To own a mule or ox team means quite an expense. A good yoke of oxen costs from \$200 to \$300, and a span of mules from \$200 to \$500. Even Mr. S., with all of his bees, present and prospective, depends upon his neighbors for all of his freighting. It is

W. W. SOMERFORD'S HOME AND APIARY.

cheaper to hire it done than to keep and feed a team.

The bicycle answers all purposes for running from one apiary to another, and the wheeling on the calzada is sublime; but it is only a step to the ridiculous. Just turn into one of those side roads, and you have it, just as I will show you a little later.

Apiaries are plentiful along the good roads, and bee-men are somewhat jealous of their honey resources. Cuba is not all bee-pasturage. There are extensive areas along the calzada where but few honey-plants are visible; and I am assured that, in some places, bees would scarcely make a living. The honey-yield from which the bee-keeper secures his revenue comes during the months between November and April. Owing to the shortened days of winter the bees work on an average about four hours.

Though the nights are not so cool as in California, still they are cool enough to drive the bees to the brood-chamber, and it

gin to swarm, and keep the bee-keeper busy with a rapid increase.

Mr. Somerford was well supplied with helpers, and I herewith introduce them to your readers. First to the left, Mr. Somerford; next Mr. Faulkner, from New Jersey; Mr. Livingstone, Mr. Wade, and two Cuban boys. Observe the machete on Nicano, ever present on a Cuban, and the scarf around the neck of Frederico, and in such a mild climate! We shall have more of this apiary in our next.

NOTES OF TRAVEL.

Bee-keeping in and about Los Angeles; some of the Characteristics of the Business in California.

BY E. R. ROOT.

The conditions as well as the methods which prevail in California are somewhat different from those in other portions of the United States. The great bulk of the honey produced is extracted, and one of the reasons for this is, doubtless, owing to the fact that a very large part of the product must necessarily be shipped out of the State. Another reason is, that the honey from sage is not inclined to candy, and because it keeps liquid so long it can be sold anywhere.

As a general thing the hives I saw in California were home-made, and poorly made at that. Some of them had seen ten or twenty years of use, and were somewhat the worse for wear. But in that climate almost "any thing goes" so long as it will hold together and protect the bees from the hot rays of the sun, and from the rains that last for a comparatively short time.

If there is any place in the United States where bee-keeping is conducted on an extensive scale it is Southern California. As a general thing, non-reversible or two-frame extractors would be considered mere toys. The extensive bee-keepers on the coast will have nothing smaller than a four-frame reversible machine. This they want mounted on a slight elevation on the side of a hill. The honey runs from the extractor into a spout that connects with a ten or twenty ton galvanized-iron tank. Talk about letting the honey run into a tin pail and then lifting the pail and dumping it into a can—why, those fellows would laugh at you. They want things handy, and they have them so—all but the hives. Of all the miserable contraptions that some of those big bee-keepers will put up with! I never saw the like. Brood-frames—some of them look as if they had been made with a hatchet—and, as I have been told, were actually chopped out with this rude tool. Burr-combs? Yes, they have them galore, because the bee-spaces vary all the way from

W. W. SOMERFORD AND HIS HELPERS.

has been found that bees are slow to occupy section supers and draw foundation; therefore comb honey has been produced to a limited extent. This feature will probably be overcome, for several are experimenting with comb honey this winter. I have an idea that a shallow hive will fill the bill for comb honey in Cuba.

The honey gathered at this season is from aguinaldo, or bellflower, or morning-glory, just which you wish to term it. There are three varieties. The first to bloom is just like the well-known morning-glory of the States. The next is a purple and smaller flower; and the last and most profuse is the white. These flowers are ordinarily all gone by Feb. 1. Then for several weeks ramerillo amarillo comes into bloom. This is a plant of bushy habit, bearing a profuse bloom of small yellow flowers; the honey a light golden yellow, much like the sunflower honey of Central California. In fact, the blossom is a very small sunflower. In March and April, when the weather is warmer, and fruit-bloom is on, the bees be-

the regulation $\frac{1}{8}$ up to 2 inches. Then when the hives were opened, such a mess of broken honey and an uproar, especially if it was toward the close of the season, and the bees were beginning to nose around to see what they could find! But of this I shall have something to say more specifically later on.

To give one something of an idea of the amount of honey produced in California in a good year, perhaps a few figures may be interesting.

SOME POSSIBLE RESULTS IN HONEY PRODUCTION IN CALIFORNIA.

Up to 1901 the seasons had been very discouraging for several years. Then there was a fairly good flow. When the season is favorable, San Diego Co. will average somewhere about 80 carloads of honey; Los Angeles Co. somewhere about 60; Riverside, 75. Taking the counties of Orange, Los Angeles, Riverside, and San Diego together, the enormous aggregate of 500 carloads could possibly be produced in a good season; and it is estimated that this amount was actually harvested in 1896. Some of the old resident bee-keepers of California say these figures are too large, even for a good year. On the other hand, there are apiaries yielding little lots of honey, produced all through the mountain canyons, that never gets out into the general markets, and therefore is not counted.

Some time in the early 60's, I am told, Mr. Harbison, who at one time was thought to be the most extensive bee-keeper in the world, and who possibly has made a record that will never be equalled, owned and operated as many as 6000 colonies; and his average for the entire number, I understand, was something like 60 lbs. per colony, extracted honey. It is reported that a man by the name of Easley, who had come from the East, starting with 500 colonies, increased them to 1200 in one season, and took 180 tons of honey. This was near Santa Monica.

THE DISCOURAGING FEATURES OF CALIFORNIA BEE-KEEPING.

But lest some of my readers may get the impression that there is nothing but gold and honey in California, I think I had better tell something of the other side. Experience has shown, I believe, that there are only one or two good years out of five. In the two or three off years, many thousands of colonies starve to death; and it is only the regular stayers who manage to hold over, waiting for the good year that is bound to come if they can hold out long enough. In Los Angeles Co. alone there were, in 1897, something like 40,000 colonies. At the beginning of 1901, after a period of four bad seasons, it was estimated there were only about 12,000—the remainder, something like 28,000, having probably died off from the continued drouth and the consequent lack of forage.

Several bee-keepers who had come from the East to California told me that, although they produced enormous crops of

honey some seasons, they believed that their general average per colony was no larger in California than in the East, and this, coupled with the almost prohibitive freight rates to the markets, makes California bee-keeping no bonanza.

These off years are due entirely to lack of rainfall. Some parts of California require more inches of rain than others. Several bee-keepers told me that, if they could get 10 inches for the southern counties, they would get at least a light crop, and in some portions a good crop would be secured. In other portions, from 14 to 20 inches seem to be required, a good deal depending on the soil and the lay of the land. Down deep in the canyons, where many an apiary is located, and where the sun strikes not more than five or six hours during the day, a small number of inches of water would probably do; whereas in the open valleys more might be required.

A FEW REPRESENTATIVE CALIFORNIA APIARIES.

Having now generalized on the conditions and peculiarities of bee-keeping in Southern California, let us take a look at some of the men and some of the apiaries just as I found them with my little kodak.

B. S. K. BENNETT.

After having visited with Mr. Frank McNay, as spoken of in our last issue, I sought out Mr. Bennett, the editor of the *Pacific Bee Journal*, and later on I arranged for a drive out among the bee-keepers in the immediate vicinity of Los Angeles. A

quick-stepping little horse and a light easy buggy carried us from point to point with a good deal of ease and comfort.

Our first stop was at the apiary of Robert Hitchings, of Verdugo, where there were 200 colonies in the valley at the foot of one of the hills. Two large honey-tanks were located right beside the extracting-house, behind some sage brush, as shown in No. 3, Fig. 1, and the apiary is shown in No. 1 just above. It is located perhaps two or three miles from any dwelling-house, and the tanks were nearly full, or at least we judged so. Situated as they are out in the open, with honey-gates totally unprotected, made, it seemed to me, most inviting objects for thieves; and there was no one present at the yard at the time of our visit. "How easy," I said to Mr. Bennett, as we looked over the premises, "for some one to come here and help himself! He might come every night, just after an extracting, and take off a ton or two, and the owner would never know it. If he were not too greedy, and took just a little at a time, the bee-keeper would work and plod

while the thief would manage to get probably half of his crop."

"Yes," said Mr. Bennett, "this kind of thieving work has been done; but out here in California, if the thief is ever caught he is dealt with most summarily. As a general thing, open tanks like these are not molested."

Then he told me how, evidently, some animal had brushed up against the honey-gate of a ten-ton tank clear full, in one instance, opened the gate and let all the honey run out on the ground; and, such a mess!

Stepping into the buggy again we resumed our journey, for Mr. Bennett seemed to know where every bee-keeper was located, and what his name was.

Our next stop was at the apiary of Rev. C. G. Belknap. This apiary was located in the rear of a rabbitry that had formerly been a brooding-place for Belgian hares; but the industry had not proven to be profitable, and, if I remember correctly, there were only about three or four animals in the building. But, oh the bees! They greeted us before we got anywhere near their

FIG. 2.—MR. WOODBURY'S APIARY.

quarters. They stung us; they tried to drive us off; but still we pressed on. So persistent were they that I found it exceedingly difficult to get a snapshot. I fired one off, and then retreated in haste. But this view was too poor to reproduce.

Our next stop was at the home of Mr. G. B. Woodbury. This gentleman is also an extensive fruit-grower. He had several large orange-groves as well as other kinds of fruit on his ranch. He had recently taken up bee-keeping, and the apiary had something of the esthetic in its appearance, and, indeed, it was in marked contrast with some of the yards I had seen before. The honey-house was neatly painted, the hives were new and modern, and also painted. No. 1, Fig. 2, shows Mr. Woodbury himself, standing by the side of one of his hives. No. 2 shows Mr. Bennett standing in the door of the honey-house.

I ran up on the side-hill to get a good view of the yard. While setting up the camera I had my first experience with a rattlesnake, or what I *thought* to be such. I had been cautioned, as I went up on those side-hills, to look out for those reptiles; for a tenderfoot will be quite sure to blunder on them unless properly warned. Suddenly I heard a peculiar kind of b-z-z-z-z. I had never heard the sound of the rattlers; but as I had been told to run or get out of the way if I should hear any peculiar

sound of that kind, I grabbed up my camera and made a lunge.

"What," said Mr. Woodbury, "rattlers?"

"I don't know," I said in breathless haste; "but come up and look."

"What was it you heard?" he said.

"There! listen!"

He began to smile, and said, "Why, that is a beetle. Don't you have them out east?"

I resumed taking my pictures, without any more comments, and the result is shown in 2; another view, lower down, at 3, and, last of all, a view showing Mr. Bennett with his light gauzy bee-veil on by the side of one of Mr. Woodbury's hives.

Another yard at which we stopped was one belonging to John McClure, at Burbank, or near there. He had, all told, some 500 colonies in three different locations. In No. 2, Fig. 1, is shown one of these apiaries. It is on the side of the mountain, near the edge of an enormous raisin vineyard, which we were almost half an hour in driving through to get to the yard. The hives were of the peculiar California style, not built for beauty. A nearer view of the extracting-house and of the large honey-tanks is shown in No. 4. The wheelbarrow for carrying in the combs stands in the foreground. The extracting-house in this case is on the side-hill, and from the bottom of it runs a spout about 3 inches in diameter, at the top of

FIG. 1.—THE HITCHINGS AND M'CLURE APIARIES AND HONEY-TANKS.

the honey-tank. When one tank is full the spout is shifted over to the other one. In the mean time a piece of cheese-cloth is tied over the top of the filled tanks to allow of evaporation.

The extracting-house and the storage-tanks on the side-hill shown in No. 4, Fig. 1, are representative of dozens that I saw in California. The house is just large enough to accommodate an extractor, uncapping-box, and the necessary tools for working. The hives in this case, as will be seen in No. 2, Fig. 1, are located above on the side-hill. The extracting-combs are set in a barrow or cart, and the load is run downhill until it reaches the extracting-house shown in the lower left-hand corner. The whole arrangement of these California apiaries is such as to provide for honey going downhill all the way, so that about all a man has to do when he loads up his cart or barrow is to let the thing go itself down grade. When the honey is extracted it runs from the machine downhill again into the tanks. These are usually set up on the ground about 15 or 20 inches, or just high enough to let the honey run from the honey-gate into the square 60-lb. can—the favorite package for extracted honey on the Pacific coast. These are filled one at a time, and put into a wagon that is backed right up to the tanks. It is then delivered to the nearest railroad station, or sometimes hauled all the way to market, as at times freight rates in California are almost prohibitive.

FREIGHT RATES IN CALIFORNIA.

The railroad company proposed, I think, in one case to charge a bee-keeper \$120 for hauling a carload of honey only 40 miles, and then did not deliver it at the dock. He finally hired a teamster with a truck, and hauled it to the boat-landing, for less than \$40. But the aggravating part of the whole thing was that the railroad company was mean enough to offer to deliver the *next* car for \$40, when before it had stated it could not haul it for less than \$120 and make a profit. The agents of some of the companies, I am told, are instructed to "charge all the traffic will bear," and they do. And that reminds me that one of the things the residents of California have to put up with is exorbitant freight charges. In some cases the common roads are too mountainous for wagon traffic, and the poor rancher has to pay the rate or go without marketing his product.

We drove that day something over 40 miles—46 in all, I believe. We stopped at a good many different apiaries, and took some photos; but those I have reproduced are representative lots showing the apiaries as they appear round about Los Angeles, and, I should say, pretty much all the rest of California so far as I went through it. I found Mr. Bennett to be a man who is exceptionally well posted on bee-keeping as it is carried on in that land flowing with milk and honey; and the long pleasant drive I had that day in that valley will remain as a pleasant spot in my memory.

CALIFORNIA; THE BLESSING OF THE RAIN.

The fears of a dry season have been dispelled; abundant rains have fallen in all parts of the State. In the South, where the rainfall is always less than in this northern section of the State, much relief and thankfulness are felt, for it means prosperity to the bee-keepers as well as to the fruit-growers, ranchers, and stock-men generally. Here in the Santa Rosa Valley (fifty miles north of San Francisco) the rainfall up to Feb. 3 was 18 inches, and since then we have had gentle rains almost continuously, making a total of 25 inches recorded up to Feb. 26. During the past three days nearly 6 inches have fallen, and some damage is feared from rising waters, for the rain has not yet ceased.

At Los Angeles, on the 25th the precipitation was one-fifth of an inch, with rain still falling, making six inches for the season against 12.68 inches to the corresponding date last year; but a continuance is expected. Even in those sections where the showers have been lightest and least frequent it appears that there has been a sufficient supply to insure the spring crops.

At San Bernardino they have been visited by a steady downpour. At Santa Barbara, $\frac{3}{4}$ inch fell in one day; and at San Louis Obispo, 1.09 inches fell in the last 24 hours. At Eureka, in Humboldt Co., in the extreme north, 1.42 of an inch fell in the same time, against .20 at San Diego, in the extreme south. Ensenada, in Lower California, received more rain than did San Diego.

To none will it bring more gladness of heart than to the bee-keepers; for without this rain the sages, which form so large a part of the natural pasturage of the great honey-producing sections, would not have yielded nectar. To the olive-groves, vineyards, and great fruit-orchards, the coming of the rain means bountiful crops; for at hardly any season are the showers more propitious than those that fall in February.

We have lost one good bee-keeper from this section—Mr. G. O. Miller, of Haldsburg, who has gone to Los Angeles to take his part in the hoped-for prosperity of that southern region. We wish that he and all the workers there may find abundant reward for their toil and skilled efforts in the bee-field this coming season.

DR. FREDERICK WEBLEY.

Santa Rosa, Cal., Feb. 26.

BEEES IN THE WALLS OF A HOUSE; HOW TO GET THEM OUT.

This is from a poor ignorant woman whose knowledge of bees consists of the two facts that they sting, and also make honey. She lives in an old house where bees also live, they having entered years

ago through knot-holes in the clapboards. For some time honey was taken out every year, but of late years none can be reached, and every fall there is a strong smell of over-fermentation. Now, the new owners want to know if there is any way of ridding the house of them except by burning it. The woman of ignorance imagined a new queen in a tempting hive would tempt them out where they would prove the nucleus of a fortune, or at least provide the family with honey. What particular form of endearment is used in cajoling bees? and with how long a pole is it allowable to handle them? They have always been very much attracted toward the woman, showing a desire to nestle in her hair, etc. She is firmly persuaded there is no good bee but a dead one, and expects to badger the men into the necessary formalities.

HELEN M. GRIFFEN.

Yorktown Heights, N. Y.

[When a colony or colonies of bees once get lodged in between the inner and outer walls of a dwelling it is not an easy matter to get them out without tearing off the clapboarding. I have seen several attempts made to take the bees out. Perhaps the most feasible is to put a Porter bee-escape over the entrance or knot-hole through which the bees go. This will catch all the flying bees, and all other bees as fast as they come out to fly. But the result in the end will be some dead brood, some young bees, the queen, and more or less honey. After all, the attempt at best is somewhat abortive. If the brood die, there will be a smell, and the honey may sour, or it may melt from the direct action of the sun's rays, and at some future time leak out and run down somewhere.—ED.]

TWO-STORY DANZENBAKER HIVES; CONDITIONS UNDER WHICH THE SAME MAY BE USED.

Can a larger crop of comb honey be secured by using two stories to a Danzenbaker hive? and will it curtail the desire of the colony to swarm? I should like to hear of other bee-keepers' experience with two-story Danzenbaker hives.

WM. H. EARNSHOW.

Bridgeport, Pa., March 19.

[A great deal depends on a locality as to whether two brood-chambers of a hive can be used to advantage. My impression is that, situated as you are, you could to very good advantage use two brood-chambers up to the beginning of the honey-flow. At that time, crowd all the brood into one brood-chamber, and give the remainder to some other colony or nucleus. In place of the brood-chamber removed, put on another with empty combs. After the bees begin to store in the combs, put on a comb-honey super containing sections, with full sheets of foundation, and then look out for comb honey.—ED.]

A SIMPLE TEST FOR DETECTING GLUCOSE IN HONEY.

Have you a simple test for the purity of honey? Why not tell us how to analyze honey, through GLEANINGS? I have access to a chemical laboratory.

Peru, Ind.

GEO. S. DEMUTH.

[It would not be practicable for the average person to analyze honey to determine its purity. This is the work of experts, and the very best of them at that. A simple test, however, may be applied in the case of honey suspected of containing glucose. If a little alcohol be stirred in with such mixture a slightly cloudy appearance will be noticed in the course of five or ten minutes if glucose is present. But if one is familiar with the "brassy" taste of ordinary commercial glucose he can usually, by means of his tongue, detect (at least for his own satisfaction) the glucose in honey, even if only a small amount is used.—ED.]

QUEENS FLYING OFF THE COMBS.

The queen that I received last summer came in good condition, and was successfully introduced by being allowed to run in at the entrance. On the third day I had some friends call, and they wanted to see the new queen; so I took out a frame of bees, found her, and we were inspecting her, when, without warning, she left the frames, flying over the barn, and that was the last I ever saw of her. Did you ever have such an experience?

SAM. A. FENNER.

Providence, R. I., Mar. 15.

[The circumstance which you have related is not an unusual one. A queen that has been introduced is usually a little shy; and when the hive is opened she may be frightened. She may rush about over the surface of the comb trying to hide, and this act of hers has a tendency to excite the bees, with the result that they grab for her. This will frighten her the more, when she will take wing, possibly never to return. But when a queen "lights out" in this fashion it is best to set the comb back in the hive, leave the cover off, and go away and leave the hive. There are chances she will return and go in among the combs.

I have two or three times stopped queens by knocking them down with my hand. This may stun them a little, but they will recover all right providing you can catch them in the grass before they take wing.—ED.]

NIGHT VENTILATION OF BEE-CELLARS NOT SATISFACTORY.

I have tried your plan two winters of leaving a cellar door open nights and closed days; heat about 42 to 45°; went up one or two days to 50°; have a large cellar with heater, but not in the part where bees are, and I will never try it again. They kept up a roaring all winter, and came out bad. About three bushels of bees came out on

the cellar bottom. I have wintered for 50 years in a cellar, and only once did I ever have them winter so poorly, and that was when they got honey-dew.

West Rupert, Vt. C. M. LINCOLN.

[I can not understand why you should have had results so unfavorable. Our bees would roar invariably if we did not give them sufficient ventilation. Sometimes when the days were muggy and warm outside, the bees would become quite restless till toward night; then when we swung the doors open, in the course of an hour or so they would become quiet. During this time the thermometer would remain about the same. I should be inclined to feel that the food or some other condition, rather than the opening and closing of the door at night, was responsible for the uneasiness on the part of the bees.—Ed.]

A BUNCH OF QUESTIONS.

1. Is there any danger of introducing foul brood into one's apiary by using comb foundation from any and all dealers? If so, where would you buy foundation?

2. How many days old is a drone from hatching before he is able to fertilize a queen?

3. By using Alley drone-traps can one rid a hive of drones that may be in there, providing no more be raised? How long will it take to do it?

4. When running for extracted honey, about when would you put on queen-excluding honey-boards?

5. In the early spring, just before drones begin to fly, can one secure as good queen-cells by the Doolittle method, as in swarming-time, if he feeds the colony to stimulate them? How much and how long should he feed? Will the cells produce as good queens?

6. Where can I get an electrical apparatus for imbedding foundation-wire? What will it cost?

7. I want a fine breeding-queen—one for business not color. What sort of queen would you advise me to get?

HENRY PERKINS.

Highland, San Ber. Co., Cal.

[1. Not the slightest. Foul brood has never been known to be transmitted through foundation.

2. I do not know exactly, but anywhere from ten days to two weeks.

3. The Alley trap will take care of all the drones in the hive. It may take a week or so before the drones attempt to fly; and when they do they will go into the upper chamber, where they will die of starvation.

4. Excluding honey-boards should be put on at the same time that the supers or upper stories are given.

5. Nearly if not quite as good queens can be secured by the method you outline; but the feeding must be of a stimulative kind—a very little thin syrup daily. If the weather is cool or chilly at night I should not

expect as fine queens as I would later on when the weather is more mild.

6. The A. I. Root Co. now supplies an electrical apparatus made up of six dry cells for imbedding wires into foundation, at a cost of \$3 00. This includes a complete outfit.

7. I would select my queen-breeder, and then call for just the kind of queen you call for in your question.—Ed.]

TWO-STORY HIVES FOR MICHIGAN; SPRING MANAGEMENT.

On page 822, last year, you say you would not advise the use of the double-decker for all localities. Would it not be an ideal plan in Michigan? If I take my bees out of the cellar about the middle of April, how many pounds of stores does each colony require in order to build up strongly? In case some colonies have from 25 to 30 lbs. of stores left, can I leave that, or had I better take some of it out, so as to give them more room for brood?

After the middle of April can I encourage brood-rearing too much or too soon? I desire to have them in the best possible condition for white clover.

W. Bos.

Forestgrove, Mich., Mar. 27.

[Double-decker colonies might answer very well for your part of the State. Under no circumstances would I advise you to take away any stores from a colony of bees at this time of the year, for they will need all they have. I would not stimulate brood-rearing too early in April. For your locality you had better not do any thing of the kind before the first of May, and not even then if the weather should remain cool.—Ed.]

SEALED V. POROUS COVERS IN WINTERING ; ALFALFA.

What do you think about wintering bees under enameled quilts with a good supply of packing over the top, and with a Hill device over the frames?

The farmers are beginning to sow alfalfa clover, and some people say it will not produce any honey in this State. Is it true that it has failed in some States?

A. A. STICKLEY.

Strasburg, Va., March 17.

[Enameled quilts are very often used in packing over a brood-nest, with very good results. They make what we call a sealed cover. Others argue in favor of one porous, like burlap, claiming that the moisture then has an opportunity to pass upward and away from the bees; but this is an objection in that the packing material becomes damp and cold. All things considered, we should prefer in our outdoor wintering the sealed covers.

Alfalfa does not yield honey in all States. In the East we do not know of its furnishing any honey, while in the West generally it is regarded as a very important honey-plant.—Ed.]

WINTERING AND HOUSE APIARIES.

Will you please state in GLEANINGS the best method of uniting two or three colonies to make one strong one when they are scattered about ten feet apart among 25 other hives? Also please state the advantages and disadvantages of a house-apiary for 25 colonies, and ask other subscribers to give their experience with same.

Philadelphia, Pa. JOHN P. TULL.

[If the colonies or the nuclei to be united have been outdoors all winter, and if it is desired to combine them together into one colony, utilizing the heat, the task is not an easy one. I have united nuclei in the spring; but in two or three days after bringing them together, the little colony that received fresh infusions of strength from other sources was about as weak as ever. The trouble is, the bees of the several nuclei, as soon as they fly, will be pretty sure to go back to their old locations. If there are no combs of honey to receive them they will starve even if they do not chill to death; but weak nuclei in the cellar can be united before taking them out, or afterward if it is more convenient. But the uniting must be done before the bees get to flying and marking their locations.]

Regarding house-apiaries, they should be used only when land is scarce, and thieves are prevalent in the locality. They are handy to work in all kinds of weather, and the colonies can be opened up without inducing robbing. A lot of cross bees can be handled in such a building much more comfortably than outdoors.

The main objection to the house-apiary is the expense and its lack of portability. For further particulars you are referred to the A B C of Bee Culture, where the subject is discussed very fully.—ED.]

WHAT TO DO WITH COMBS OF STORES ON WHICH BEES HAVE DIED.

What do you do with honey and comb that are left in the hive after bees have died in spring? Would you advise hiving new colonies on this old comb at swarming, or would you think it best to give them new foundation? J. H. MURDAUGH.

Croswell, Mich., March 11.

[There is no objection at all to putting a fresh lot of bees upon combs from which other bees have died, unless the combs are badly smeared with stains of dysentery.—ED.]

SPANISH NAMES.

Mr. Root:—In regard to the pronunciation of the Spanish names of shrubs or trees you give on p. 863, I will beg leave to say that, according to the rules laid down by F. M. de Rivas, who is a graduate of the University of Sevilla, Spain, and of St. Edmunds College, London, it should be respectively: *goo-ah-heel-ee-ah* and *mais-kee-tai*, and not as you give it, which I judge you did, probably, after the manner of

Americans who pronounce largely after the manner of the Mexicans, or according to local custom, which is often about as much Spanish as the Scotch brogue is English.

J. B. WIENMILLER.

Pineridge, Cal., Feb. 23.

[You are quite right. I was simply giving the local pronunciation. But I fear your spelling would be capable of still greater perversion, as you make five syllables out of *guajilla*, which is pronounced *gwah-heel-yah*. The other word has three syllables, pronounced like the English "mace-kee-tay," and not "mes-kee-ti," as you seem to make it.—ED.]

SPREADING EXTRACTING-FRAMES.

1. In extracting from the top story of a Dovetailed hive would it not be better to use only seven combs, dispensing with the Hoffman principle altogether? It is a vexatious and tedious job to extract from Hoffman frames when placed in contact with each other.

2. Is not the ten-frame hive superior to the eight-frame when used exclusively for extracting? ALPINE MCGREGOR.

Inglewood, Ont., March 12.

[1. It is the practice of some bee-keepers to space their combs further apart in the extracting-supers. Hoffman frames can be spaced anywhere from 1½ to 1¾ in. from center to center; and from the fact that they have wide end-bars, a half-inch space does not interfere in the least with the practice.]

2. The ten-frame hive is generally regarded for extracting purposes as better than the eight-frame, especially in the South.—ED.]

WHERE TO START AN ABIARY.

I wish to know where in the United States would be the best place to start an apiary.

STEEN FREEMAN.

Cedar Mills, O., March 30.

[It would be almost impossible to answer this question satisfactorily. The climate and general conditions of various localities are such that I would have to know what your capabilities and general health are. Some persons can not stand the hot or dry climate of Texas and Arizona; others can not live in a high altitude, like Denver or up on the Rockies in Colorado or Montana; and others could not bridge over two or three bad years out of five, such as one would find in Southern California; and still others would not like to pioneer it in a new country without its modern conveniences and "good society." If you follow the series of articles that I am writing, giving an account of my trip through the various bee localities of the United States, from Alabama to the far West, and back again, you will, perhaps, be able to come to some conclusion as to where you had better locate.—ED.]

Therefore take no thought saying, What shall we eat? or, What shall we drink? or, Wherewithal shall we be clothed?—MATT. 6:31.

Seven times within the last two years I have made a trip to the Traverse region of Northern Michigan when used up physically and mentally, with impaired digestion, etc.; and seven times I have returned full of strength, energy, and vigor, both mental and physical, and, I hope I may say, *spiritual* as well; and once more the question confronts me, Is it altogether the healthfulness of the locality with its vitalizing and invigorating breezes from off across the northern lakes? or does this wonderful renewal of health, strength, and *happiness*, come from different habits and different modes of life? I rather suspect it is both; and in any event I can give God the thanks for having answered once more my oft-repeated prayer, not only for health, strength, and enjoyment for *myself*, but that I may direct others who are coming to me for advice. Did God, when he created man in his own image, expect him to regain and *retain* health through drugs and medicines, or otherwise? Yes, I may say not only seven times in my experience, but when Mrs. Root went with me, although she had very little faith in my enthusiasm she was forced to admit that she found a degree of strength, health, and vigor that she never expected again in this world. Now, to be sure that I have made no mistake let me go into particulars a little. If you should think my story is a long one, please bear in mind that it has to do with the health and happiness, not only of untold thousands, but perhaps millions.

I reached Traverse City between 6 and 7 o'clock Saturday evening, March 22; and I was so anxious to get among my friends, eight miles away, up on the hills, that I started off on my wheel by moonlight, carrying my grip. When I reached the first country store, however, two or three miles out, I found I could not carry my grip up the hills to the place I was going to; but a loaded wagon that I overtook proved to belong to a neighbor of Mr. Hilbert, and the driver kindly took it on top of his load. As the snowdrifts were not all out of the way, I had a pretty tough time of it, and reached friend Hilbert's just before bedtime. My young friend Alice informed me the Sunday-school had been closed all winter, and that there had been very little preaching service; once, the drifted snow had prevented the people from getting out; and at another time, by mistake in appointment, the congregation gathered, but there was no minister; and as they have services only every other Sunday any way, the meeting-house had been standing empty, much of the time, even on God's holy day. It was their cus-

tom to start up the school the first of April. I said something like this:

"Now, look here, friends. It is a long while since I have passed a Sabbath without going to Sunday-school or church, or attending any place of religious worship. I rather think we will have a Sunday-school there to-morrow."

There were, however, all sorts of objections in the way. First, it was not announced. Second, the superintendent was away from home. Third, everybody understood it was to start in on the first Sunday in April, and it was then March. Fourth, there was no janitor. Fifth, the great sugar-camp of 1600 trees and 2400 buckets was running full blast. In fact, Mr. Hilbert himself was in the camp then, and was to boil all night, and all hands were to be off early Sunday morning to keep up the boiling so the sap could be handled that was going to waste. Sunday morning, however, I was well rested, and full of enthusiasm to have a Sunday-school. Alice was almost the only one of the family that could be spared from the sugar-making. I commenced calling at the houses, inviting them to come to Sunday-school; but it was mostly *uphill* work. Once in a while the bright smiles of the mothers and the animated faces of the children at the prospect of going to Sunday-school made the work a *little* downhill. I found the superintendent's father, and he said it was all right if I could get the children to go, and he got the key of the church for me.

At the next house I found a father and five children eating breakfast. The father was quite sure that none of the children could go. He said they were not the Sunday-school kind. The oldest girl, however, admitted that I had seen her in the Sunday-school the summer before. I knew if I gave up at the start I should lose my enthusiasm, so I stopped to talk with the father a little. I soon found out that in the old country he had worked at gardening under glass, and knew about hot-beds, cold-frames, sashes, etc. Then I pointed out to him what could be done in his locality with the piles of heating stable manure close at hand. I finally got permission to get one of the boys to go with me to make trips crosslots to houses too far away for me to reach alone. Then I went through the whole little town of Bingham, shook hands with the mothers and fathers, and talked with the children, and had a good-sized crowd in full sympathy with my undertaking before half-past ten, the usual hour for the Sunday-school. The woodshed was locked up, and I did not have the key; but I picked up splinters around the church door, thus ridding up the yard, and soon had a pretty good fire in the stove. By this time I began to feel happy; and it was a great privilege to kneel there in that little church alone and pray for the mothers and the children I had talked with, that were already on their way to Sunday-school. One of the objections to keeping Sunday-school going all winter

was that the snow was too deep, so they could not get to the church. I asked several if they ever found a snow too deep to get to the one saloon. All agreed that never a Sunday had passed without there being a well-beaten path to its front door.

After Sunday-school my heart was rejoiced again by two pieces of information. First, the saloon was to be removed; in fact, the fixtures were already sold. Second, the reason of its removal was that it *did not pay expenses*. Oh what an easy way this would be to settle that vexed question that is now stirring the whole wide world—saloon or no saloons! If the proprietors could just be made to pick up their duds and leave because of *lack of patronage*, what a deal of quarreling and hard feeling might be saved!

Well, it was arranged that, after Sunday-school, I was to get my dinner over at the sugar-camp. I told Mrs. Hilbert in the morning all the dinner I wanted was some Russet potatoes roasted in the ashes, and some milk to drink while I ate them. Of course, we had bread and butter, and maple syrup as a side issue, and a very good dinner it was. When I told friend Hilbert that, as I had spent the forenoon worshipping God, I should like to help a part of the afternoon in saving the sap from wasting, he said he did not know any thing I could do unless it was to sit on a high stool and boss the ranch. I told him I used to be ambitious when I was young, but I had gotten over it. I asked for a light tin pail and a tin dipper that they could spare as well as not. I told Alice, after she had cleared away the dinner-table, to come and help me. The greater part of the immense maple-trees had two buckets, but usually only one bucket was running over, so we dipped sap with our dippers into pails that were not quite full. At many of the small trees the pails were only half full; and we carried sap from the pails that were running over, into these. The cistern was full of sap; the store-troughs were full, and the boilers were going at such a rate that one or another of the six or eight was boiling over most of the time. The plan I was working on was about the only one to save the wasting sap. Three teams were gathering—that is, as fast as the boiling would permit them to gather. When we had stopped sap wasting, by equalizing as far as we could go, we followed after the gathering-tank and took a dipperful or two from the pails running over, and carried it to the pails that had just been emptied.

By the middle of the afternoon, as there was no sap going to waste I started off crosslots in the direction of that "cabin in the woods." I was a little tired when I reached it, for you know I was a little out of practice in climbing those great hills; but when I opened the door of our little home and found every thing in apple-pie order, just exactly as we had left it last November, I once more knelt down and thanked God for his great mercies on that

little home. Nobody had meddled with any thing. As there is no smoke or dust in that out-of-the-way place, even the cheese-cloth screens over the windows were just as clean and perfect as the day Mrs. Root put them up. Finally my eye rested on a big stout chest, where our most valuable articles of clothing, etc., were, as we supposed, most securely locked with a strong double-bolt lock. Sure enough, the broad plank that made the cover had warped during the winter, and by some unexplained means had sprung open that strong lock. The cover was opened just wide enough for a mouse to crawl under—yes, and they *did* crawl under. Mrs. Root had placed in this box for safety a bag of crackers, some granose flakes, and part of a sack of flour. The mice had got in and held a picnic there all winter. A very comfortable and stylish nest had been made inside of her Sunday hat, and the piano spread that we used on our little round dining-table had furnished some very soft and appropriate material for said nest. Luckily, however, these were the deer mice of the woods, and hence there was no smell about their work as with the common house mice. God in his infinite wisdom has seen fit to send us, all along, thorns with the roses; and while I felt sad about this mishap I could thank him all the same. It took me till dark—in fact, I had to light a lamp to finish taking every thing out of the chest and shaking and brushing it to restore things to order. Then I found I had to go a quarter of a mile to get some milk, eggs, and bread and butter, etc., for my evening meal. I was so tired when night came that I curled up under my warm woolen blanket on my rustic bed up by that little stove I told you about last fall, with a keen appreciation of a warm cosy place to rest. Yes, I *was* tired after my busy Sabbath day's work; but I was happy—yes, *very* happy.

Shortly before this trip I have been telling you about, our pastor, Rev. Jessie Hill, gave us a sermon, using the text I have at the head of this chapter. From this sermon I make the following extract:

Worry is not the most common sin among the very poor. They possess a stoicism and indifference that makes them indifferent to their condition. But worry is a *familiar* face among those who own larders and wardrobes. We account for this on the basis that as a man goes up in the scale of being, his wants become more numerous. In most cases the multiplicity of wants is the badge of civilization. A jelly-fish finds food in the seaweed which grows in the decayed tissues of its own organism. Its wants are few. But its life is among the lowest form of animal life.

But we have magnified the complexity of modern life by elaborating what God intended to be simple. Eating was intended to be the soul of simplicity. A very little food prepared in a very simple way is all that is necessary for healthy life. But now, unless we have a dozen spoons, several forks and knives, half a dozen side dishes beside each plate, we haven't had any thing to eat; and a mother testified the other day: "I might as well run a private sanitarium. We have five different sorts of health food and three kinds of cocoa in the pantry; and the cook, who is justly proud of her hot bread and her coffee, is losing all patience with us. Sure, and they are getting so that hot water'll be too strong for them." I heard her say to the housemaid yesterday. "'Tis a sick-diet kitchen this is coming to be, and no place for a girl that can make eleven kinds of cake."

And the same is true of clothing. Comparatively speaking, a very little clothing is all that is necessary. But we are not satisfied with this. We care more for custom and fashion than for our own comfort. We are slaves to fashion. Fashion is a hard taskmaster. When we want clothing, fashion says: "Wear this." We say: "It looks horrid." "Wear it," comes the demand. "But it is uncomfortable," we say. "Wear it," is the reply. "Makes me look like a fright." "Wear it," is the only answer. And we wear it. Conundrum and puzzle though it may be, we wear it until one says: "Instead of wearing our clothes out, they wear us out." It would be ridiculously funny, if it were not so pathetically sad, to see people to whom the matter of eating and clothing were the *great* questions of life.

After we got home Mrs. Root and I were discussing the matter, and I told her I was going to board myself and do my own cooking in that cabin in the woods for the following two weeks. I told her I wanted to see how few dishes I could get along with, for I shouldn't have much time, and I also wanted to see what the effect would be on my health. Therefore on Monday morning, after that busy Sabbath, I started to do my own cooking, for almost the first time in my life. First I opened a pit of Early Michigan potatoes in the sandy side-hill close by the cabin. Three fair-sized tubers were placed in the hot ashes in the front part of our drum stove—the one I told you about called the "Flirt." It takes about half an hour to roast potatoes in this way and have them right. Of course, the outsides were charred black. I told you a few weeks ago I found a little charcoal with my food is an excellent aid to digestion. In fact, we had the same kind of roast potatoes in the sugar-camp the day before. When some of the boys were going to scoop out the inside and throw away the charred crust, I told them they were wasting the very best part; and that if they would try it, chewing this hard crust up very fine, they would agree with me. I think they all did so, for friend Hilbert said he noticed every boy had a black mouth when he got through dinner.

Well, with these roasted potatoes I had scalded milk, procured by simply putting my covered tin pail on top of the stove while I got breakfast. After my potatoes were nicely roasted I raked out a bed of clean glowing coals around the open front of the stove. On this I placed a couple of eggs, having first pricked a hole right over the air-bubble, to prevent explosion. Now, I like roasted eggs better than eggs you can cook in any other way; but I did not succeed in studying out a plan to prevent explosion entirely. May be some one who has had more experience can help me. Well, I not only relished my roasted eggs and potatoes, scalded milk, and bread and butter, but I began to gain in health and strength right along. I had three or four men at work that week, besides the team, and sometimes two teams, and so I did not have very much time to get my meals or wash the dishes and put them away. And I found very few dishes were needed. I had planned to have some wooden plates (such as are made by the million in Traverse City, but I didn't get around to it); and these wooden plates were to be dumped into

the stove after each meal. For a tablecloth I used a daily paper. This was folded up and put into the stove to save time. A quart of milk lasted me for just three meals. Then I carried the pail to Mrs. Heinforth (a quarter of a mile away) for another quart. She washed the pail, or we swapped pails, so I did not have any thing to do with washing utensils that had contained milk. The water I drank came from a big snowdrift close by the cabin; and it was certainly equal to any furnished by the sanitary still. During the day it was ice-cold, and I soon learned to prefer cold water to any thing else. When I can get pure water from a snowdrift I shall always choose it in preference to any tea or coffee the world has ever furnished.

During the first week my strength gave out every two or three hours so I had to go and take a rest in the rocking-chair or take a nap. But, just as it has happened before every time, I found I could work harder and longer every succeeding day. At the end of a week I worked from morning till night, without any fatigue worth mentioning. During the first week I lived on a vegetable diet except the eggs and milk. But the second week I sent to Traverse City for some beefsteak. Here in Medina it is worth 18 cts. per lb. for the best; but in Traverse City I paid 12½; and with my cooking I pronounced it the finest I ever ate. My plan was to roast it on those maple-wood coals. By the way, my drum stove is fired with large seasoned blocks of maple wood, and I always had a nice bed of clean coals.

Well, my first piece of steak was rather tough. I knew that people generally pound steak to make it tender; but I never pounded a piece in my life, although I have lived on beefsteak for years. The only thing I could find for a pounder was a carpenter's hammer; and for a good solid block I used the big white stone you may have noticed before the door of our cabin. I reasoned that, if a *little* pounding was good, more would be better. So I made that piece of steak "mellow," and then I carried it with my knife and fork to that bed of maple coals in the front part of the stove. Not only was the steak laid on the coals, but I managed to have a glowing brand of fire right above the meat as well. As it began to cook, the edges rolled up all around the outside so as to be just about the shape and size of a common saucer. This saucer held the juices of the meat so I was able to transfer it to a plate without spilling a drop. Some butter, pepper, and salt, made it as appetizing as they get it up at the very best city restaurants where one pays from 50 to 75 cents for a beefsteak. This steak, with the roasted potatoes, made a dinner fit for anybody.*

*I got along very well with the eggs and milk, without any meat of any kind; but after I got my beefsteak my strength seemed to hold out better, clear up to the next meal, than it did before; but as my health and strength were constantly on the increase this *might* have been the result even had I purchased no meat.

When Mrs. Root and I left last fall there remained a little pail of honey. It had candied during the winter; and this candied honey, with my bread and butter, while I drank the scalded milk from my tin pail, seemed so delicious and strength-giving that I thanked God again, even though I asked his blessing on the meal before I started.

Another thing I found in that little cupboard, that gave me great satisfaction, was a can that came from the Sanitas Food Co., of Battle Creek. It was labeled "Soup Stock," and was intended to make soup, or brown gravy, without the use of any meat. I used it on my bread and butter, as I did the candied honey, and I found it not only exceedingly luscious but very nutritious and strength-giving.

Just a word about candied honey as a health food. I was greatly delighted to find I could eat this candied honey three times a day, without any of the unpleasant results that honey has produced almost all the past winter down in Ohio. Toward the bottom of the pail, however, I discovered the honey was not candied; so I took a spoon and began to eat that liquid honey in the same way. I tried this again and again. The liquid honey interfered with digestion, and produced distress, while the pure white *candied honey* I could eat with impunity. Now, here is a point for those who love honey and find it disagrees with them. The pure white candied honey is certainly different from the residue at the bottom of the pail or jar. If you melt some of it you will find it is much whiter, and freer from the rank odor that remains in the honey at the bottom. Is it not Nature's method of refining this luscious sweet?

I came home strong and well—in fact, rejoicing in my health and strength. It took me just about an hour to prepare my meals and have every thing put away—that is, an hour for each meal; and the expense, as nearly as I could figure it, was just about a dollar a week for provisions. Now, of course, many people can afford to pay a dollar a day for board, or perhaps a dollar a meal; and I have no quarrel with those who prefer that way of living. But as for me, give me the simple, inexpensive way, especially as it gives me health and strength that I have never found where I live in what the world calls "style."

I forgot to say that in some respects I greatly enjoyed living *alone*. I enjoyed going out in the evening and looking up at the stars, realizing there was no human being within a quarter of a mile of me. I rejoiced in the privilege of singing old familiar hymns out loud, feeling sure there was nobody to laugh at me and look astonished unless it was the chipmunks and squirrels.*

*One of the hymns I greatly enjoyed was what we used to call "free salvation," especially the stanza which runs:

Know, then, soul, thy full salvation;
Rise o'er pain and grief and care;
Joy to find in every station
Something still to do or bear.

I rejoiced, too, at the privilege of kneeling down and thanking God right out loud whenever I felt it. Some of the friends who read this will no doubt pronounce me cranky, and say, "Bro. Root, why couldn't you thank God in your heart, or, if you choose, while standing up, just as well as to kneel down?"

Look here, my friend. Perhaps you have never done it yourself, but you have heard of boys or young men who kneeled at the foot of their "best girl" while they kissed her hand. And this was all right too. I like to see a man who thinks enough of the woman he is going to marry, or has already married, to show his love and devotion, once in a while, by kneeling at her feet; and if she is a good woman (like one or two I know of) it will not make her proud and lofty. Well, now, if it is all right to kneel before a human being—one of God's *creatures*—and a good fashion too, what is there wrong or inconsistent or unreasonable in kneeling before the great God above, who gave you life and being, who has answered your prayers in giving you health and strength, or helped you to surmount any and all obstacles that stood in the way of your happiness? During those two weeks I spent there alone in the woods, I thanked God more times for giving me a human life to *live* than I ever did before in the same length of time. Some time ago I made the remark that if Solomon had helped his wife in her household cares he would never have said, "All is vanity." Now I want to change it a little. If Solomon with all his wisdom had gone off in the woods to live alone for two weeks, doing his own cooking, and waiting on himself, I think he might not only have thanked God without even a glimpse of the "vanity" business coming into his head, but that he might have swung his hat and shouted praises, *especially* if his "outing" had been taken in the woods of *Northern Michigan*.

HIGH-PRESSURE PEACH-GROWING.

When I first contemplated building that cabin in the woods I said to friend Hilbert, "These tall hills, so steep in many places that a horse can not climb up them, are probably of no use, and never will be, for *any thing*."

Yes, I did have some crosses to *bear*, up there in the woods; and I learned while there alone to find real joy in bearing crosses, especially where the crosses were for Christ's sake. Just think of it, friends. It is our privilege as followers of Christ Jesus to rejoice when we have persecution and trouble; and of course we should rejoice, also, when we have "happy surprises" (anybody can do that); and, finally, we can be happy all the time; and yet there are people in this world who are committing suicide, *rejecting* this most wonderful and precious gift God has given us—a *human life to live*.

He replied at once, "Oh! yes, there is, Mr. Root; they are the very best places in the world to grow peach-trees. Just plant the trees all over these steep hills and you will find the hills are the best and most profitable land on your ranch."

Since then I have learned, as you know, that the ground on those side-hills, after the trees and underbrush are removed, is splendid to grow corn or potatoes, garden crops, or any thing; and the few peach-trees I planted last year made a most wonderful growth. In fact, this spring many of them were covered with blossom-buds. Last summer I kept the ground fine and mellow with a garden-rake; in fact, I made a dust mulch around every tree; and before a weed had started I raked a circle all around the trees, six or eight feet across, and kept it raked up fine until about the first of August. After that we did not encourage the trees to grow any more. Well, they have wintered on those steep hillsides without the loss of a bud or twig.

Now, I suppose I am not very much of an authority on peach-growing; but I have been reading books and papers, and studying the subject up with most keen interest; and I think I can tell you why so many people fail with peaches.

In the first place, the ground must be kept clean and mellow around the tree, just as much as it must be around a stalk of corn or a hill of potatoes to get a good crop. How can you expect peaches when the weeds are almost as high as the tree itself, and the ground full of all sorts of trash all around its trunk? Keep your peach-orchard under cultivation just as much as you would your cornfield. Second, a peach-tree, if left alone, will make altogether too much top. In fact, most varieties of peaches will make a veritable brush-pile if left to themselves. Then the branches will be pushed away out in order to get out of said brush-pile, and the peaches will grow on the ends of the limbs, where they can get the sun and air; then if there should happen to be a good crop, the weight of the fruit tears the tree all to pieces.

Some years ago I passed a peach-orchard that had been planted and cared for by a man who was an enthusiast. About the time it was ready to give its first good crop he left it and went away off somewhere else. The trees, in response to the good start they had, were loaded with fruit; but as there was nobody to thin it out nor even to prune off the excess of top, the trees broke down under their weight of peaches until almost every tree in the orchard was ruined. I saw it after the fruit was gathered, and it looked as if a big storm or cyclone had torn every tree to pieces. Modern peach-growing consists in keeping the root in advance of the top; then cut back and thin out every spring until all the branches that are left are full of vigor and life. You know how common it is to see peach-trees with almost half of the limbs or twigs dead and dying. Scientific pruning will

correct all of this. There will never be a dead leafless twig if it is pruned properly. Then if the fruit is thinned out as it should be, there will be no "June drop;" in fact, with the right kind of "heroic" thinning not a peach will drop to the ground—that is, unless stung by insects; and we are almost a match for the insects and fungous diseases.*

In regard to this matter of pruning, let me quote from the *Michigan Farmer* of Sept. 7, 1901: "Each and every peach-tree that would produce, probably, 1500 or 2000 fruits, should be pruned and thinned until the same tree produces only 200 or 300 peaches. Such drastic pruning will not be acceptable to many. They would claim that more would be received from 2000 peaches than from 200 or 300; but when the difference in cost of picking, packing, and shipping of these two quantities of fruit is considered, the profit will be found every time on the side of the smaller shipments."

You see, the markets are all the while flooded with common average or fair peaches. In fact, most markets are liable to be glutted with them; but with this method of pruning and thinning I have spoken of, every peach on the tree would attract attention by its size and beauty. A small basketful placed in sight in front of a grocery will cause people to stop, and lift up their hands in surprise. On one of my wheelrides I passed some trees that had been managed in this way. I told the owner of the trees to ship half a dozen half-peck baskets to Medina, and I would pay the bill. He said I might object to the price when I learned what he was getting for them. I told him I did not care much what the price was. I wanted them to exhibit around among my friends to illustrate the possibilities of scientific peach-growing. My impression is that I had to pay either 40 or 50 cents for a half-peck basket, or between \$3 and \$4 a bushel. Such peaches *always* sell. There is no trouble about getting a market.

Now, I can not take the space right here to go into this matter of scientific peach-growing. In the same issue of the *Michigan Farmer* just quoted from is an exhaustive article by Roland Morrill; and if you are interested in the matter you had better write and get it. Although the article is a

* Our nearest neighbor had a very pretty little peach-orchard of perhaps two dozen trees last summer. I say she *had* an orchard, because last fall the trees were so heavily loaded with fruit away out to the ends of the long sprawling branches that the limbs broke one after another until now the greater part of the trees are ruined. One Sunday afternoon we would hear a crash every little while from the limbs breaking. Now, these trees were pruned improperly to start with. Then they were allowed to overbear out on the ends of those limbs. The result was, the limbs split off or split the tree right in two where they started off from the trunk. A properly pruned peach-tree has its fruit evenly distributed all over the tree, and none of it very far away from the trunk; yet the head of the tree is sufficiently open so that the peaches ripen and color up nicely through every part of the top. It wants sense, science, brains, and *stick-to-it-iveness* to make a peach-tree grow just as it should, and *keep doing so*.

long one, I have read it over about four times. Then I gave it to friend Hilbert, who is planting this spring 3000 peach-trees on 30 acres of land much like my own, and he said it was sound all the way through. Morrill says you want your peach-trees on a side-hill, and near a large piece of water if possible. During cold frosty nights the cold air is always running downhill. It runs down as water would, but not so fast; and moving air does not hurt the peaches nearly as much as still air. Plant your trees in a hollow, between the hills, where there is no outlet for the cold air to run away, and they will freeze up sure—not only peaches but every thing else. We had a tomato-patch on rolling ground. In one spot at the lower edge was a low place where the air could not have a free outlet, and all the tomatoes were killed by frost in that low spot, and not one where the air could run away. It is the same with peaches. A body of water tempers the air and prevents severe sudden changes. Do not be fooled by paying ten times what you should for your peach-trees to the tree-sharks that are going around. Friend Hilbert got his 3000 trees at 5 cts. each, and they are nice ones. I got mine in the same lot at the same price. For smaller lots you may have to pay 10 cents each; but if you pay much more than that you are swindled. But do not be fooled into buying poor trees because they are *cheap*. If you are new at the business, get somebody who is posted to advise you. Do not plow deep in your peach-orchard. Shallow cultivation with modern short-toothed cultivators is all that is needed.

In regard to insect enemies, permit me to quote from Mr. Morrill:

I find that men who are thorough cultivators have very little trouble with the curculio. By thorough cultivation I mean cultivating every two or three days. There is no chance for an insect to get through the different stages of growth with a cultivator on his back all the time.

In fact, this frequent shallow cultivation is a remedy for almost every thing. Do not let traveling agents fool you into killing your trees with something they have to sell to keep the borers out. I think our experiment stations all agree there is no safe remedy for the borers aside from getting down on your knees (with your spectacles on), and looking your trees over frequently. Pull away the dirt from around the roots. See that every thing is all right; then put it back again. When the trees are small you can grow some crop between them providing you keep it a yard (or, better still, four or five feet) away from the trees. Last spring I found the boys had planted the Prizewinner beans I told you about, in a row between the peach-trees. The beans had made a perfect mat, and almost smothered a nice little tree just starting to grow. I pulled away the beans by armfuls, and mulched the ground around the tree for five or six feet with green beans full of blossoms. After that, the tree took a start. But it did not get over the shock during the

whole season. It seemed to have been robbed of its nutriment by those rank, vigorous Prizewinner beans. It is better to clear off your woods ground so as to leave the leaf-mold and trash to be plowed under, rather than to burn it up, if you can. We spent about two weeks clearing up say an acre and a half on those steep hillsides; but after the ground was put in nice order, stones and roots carried off, and it had had a thorough dragging with a spring-tooth harrow, we planted 50 peach-trees and put them in nicely in less than half a day; and just now I love to go off among those peach-trees, prune them, rake over the mellow ground, and fix things just according to my notion, better than any thing else in the world. Yes, that little greenhouse where I spent so many happy hours during the winter has lost its attraction—at least a large part of it—for the time being.

By the time these pages are before you, Mrs. Root and I expect to be living in that cabin in the woods, where we shall stay for the greater part of the summer, Providence permitting. We are so far back in the woods we are not likely to have many visitors; so if you should happen to get around our way you need not hesitate about dropping in; and if you do not mind eating baked potatoes (roasted in the ashes), with lots of nice milk to drink, I do not know but we can refresh you as well as interest you in the improvements we are making in our woodland home.

COLOSSAL LADINO, OR MAMMOTH WHITE CLOVER.

This clover is now up and growing nicely in the greenhouse—see page 251, March 12. The most of the plants look exactly like white clover, or white Dutch clover, perhaps; but we are a little surprised to find there are two or three different kinds of clovers. One of them looks exactly like sweet clover; and on the other, the leaf resembles crimson clover. Instead of having one new kind of clover we may have three or four—who knows? They will soon be planted outdoors, each plant being allowed about a square yard. Then we will try to have seed to sell or give away another year.

SOWING RED CLOVER IN AUGUST IN OHIO.

Our friends will remember I spoke of the success they make in Michigan by sowing mammoth and medium clovers in August among the corn. I said I was going to give it a test here. While I write, my mammoth clover, sown last August with crimson clover, is making a fine show; in fact, there is going to be somewhat of a contest between the two plants as to which shall occupy the ground. I think we may safely say this: That on good soil, well under-drained and enriched, we can sow mammoth or medium clover in August and have it come through the winter all right. The idea is to sow it early enough to enable it to make a sufficient root growth to withstand the heaving-out by frost on our clay soil.

Typographical changes in the Bee-keeper's Review, beginning with the April issue, will add much to the beauty of that journal. The glazed, shiny paper, so difficult to read unless the light strikes it just right, has been laid aside for a soft, white paper that gives to the printing a clean, tasty, tempting look.

Hereafter, the frontispieces, in most of cases, will be printed with colored inks, instead of somber black. The one for April is in dark green, and shows a century apiary—one established 100 years ago.

The cover is a light drab, the front page being printed in two colors—a dark, rich brown and Milori blue.

One feature of this issue is that it contains *eleven pages* of helpful, encouraging, suggestive editorials.

Send ten cents for this issue, and with it will be sent two other late but different issues, and the ten cents may apply on any subscription sent in during the year. A coupon will be sent entitling the holder to the Review for 90 cts.

W. Z. Hutchinson, Flint, Michigan.

Listen, Bee-keepers!

The Lone Star Apiarist

A new bee-journal in the great South-west, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world. With flowing wells, and the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now, \$1 a year. The *Apiarist* is not only for the South, but for all America and foreign countries too. Our company has purchased the *Southland Queen*, and now we have the only bee-journal in the South.

A Warranted Red-clover Queen, 30 cts.

An Offer for New
Subscribers.

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL, list during August and September. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.30 and we will mail you the Bee Journal for a whole year, and also one of our WARRANTED LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red-clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. They will be mailed in ration, beginning about June 1st, so "first come, first served."

LOGWOOD HONEY FROM JAMAICA.

If you want to taste some very fine extracted honey, send 10 cents for a mail sample of logwood honey from Jamaica. We have just received a two-ton lot in 60-lb. cans, which we offer at 8 cts. per lb.; by the case of 2 cans, 7½¢, or \$9.00 per case. We can furnish choice white California honey at the same price, and amber at ½ cent less. If interested, let us hear from you.

A NEW WIRE-IMBEDDING OUTFIT.

We have just gotten out a new wire-imbedding outfit that makes use of six dry cells. It is connected up with a multiple-point switch in such a way that a power of 2, 3, 4, 5, and 6 cells can be utilized according to the strength of the battery as a whole. This outfit is in every way superior to the one we have been sending out. It makes use of no liquids; there are no acids to corrode the fingers, and the whole thing is so simply arranged that any one can make it work. The price of the new outfit is \$3.00 instead of \$2.50 for the old one.

BEE SWAX.

Since our last issue we have received several very large shipments of wax, so that our bins are now full; but it will be gone by May 1, or soon after. If you have any to ship, not quite ready, don't put it off, for we will drop the price as soon as we get enough to run us through the season. The general market is active, and prices are firmer; but by the first of May the supply is usually more plentiful. We can not afford to pay more and not advance the price of foundation. As it is, we are selling so near the cost that it is almost like changing dollars just to accommodate the beekeepers.

HOLDING OUR OWN.

Between the middle of March and the middle of April we shipped 22 carloads, besides a large number of less than carload shipments. We have unfilled orders on hand for 17 carloads, and about 300 less than carload shipments. If any thing, we have gained a little on the orders since April 1, and shall be in still better shape by May 1 if we do not in the meantime receive too many new orders. Many things go out promptly. Hives of all kinds are crowding us the worst. Our stock of chaff hives, estimated to last clear through the season, is all gone already. We are having an unprecedented demand for the Danzenbaker hive, as well as for other styles. We have surplus stock ahead of orders on Hoffman, thick-top, all-wood, and shallow frames, slotted section-holders and separators. The demand for fences and plain sections is very heavy, showing that these sensible ideas are surely winning their way into popular favor. We have a large surplus of No. 2 sections, only in 2-inch and 1½, four openings, and 1½ plain, both 4¼ and 3½x5. Our No. 2 grade in other widths are taken as fast as they accumulate.

THE NEXT NATIONAL CONVENTION AT DENVER, COL.

The next national convention is to be held in Denver, Col. The following announcement, just received from President Hutchinson, will speak for itself:

"Denver has been selected as the place for holding the next meeting of the National Bee-keepers' Association—time, the first week in September. The exact date has not been decided upon, but the first session will probably be held Tuesday evening or Wednesday morning. The West has several times asked for the convention, and been put off with promises—that we must follow the G. A. R., or something of this sort, in order to secure the needed reduction of railroad rates. This year the G. A. R. meets at Washington, away to one side of the country. We met there several years ago, and only about twenty members were present—the most of those from near by. The West has been going ahead with great leaps and bounds, and can rightfully claim recognition. The Colorado State convention last fall was the equal of many meetings of the National Association. And in all probability the Colorado State Bee-keepers' Association will meet with us in joint convention. If held at Denver, the bee-keepers of Utah, California, Texas, and all of the great West will be able to get there. I firmly believe

that a convention can be held at Denver that will be the equal of any ever held.

"Of course, the first question asked will be: 'What about rates?' Well, they are all satisfactory, or, of course, we could not have gone to Denver as a convention without low rates on the railroads was never a success. The National Letter-carriers' Association holds its annual convention in Denver during the first week in September, and an open rate to everybody will be made at that time. A representative railroad man told Mr. Working, the Secretary of the Colorado State Bee-keepers' Association, that the regular fare outside of Colorado would be one fare, plus \$2.00, for the round trip, with a regular rate of one fare for a round trip in Colorado, while there have been made some specially low rates from some points in the East. From Chicago the fare will be only \$25 for the round trip. From St. Louis it is \$21. From St. Joseph, Kansas City, and Omaha, it will be only \$15. Rates from points still further east have not yet been definitely settled.

"Bee-keepers in the West will need no urging to come. To the bee-keepers of the East I will say, take the trip. It will open your eyes, not only in regard to bee-keeping, but to the wonderful possibilities of the great West. Your tickets will give you all the time you wish to see Colorado's wonderful mountain scenery—'The Switzerland of America.' Don't miss this opportunity of seeing its wonders, and mingling with its bee-keepers—the men and women with great big hearts.

W. Z. HUTCHINSON, Pres."

I am satisfied, from what I know of the bee-keepers in and about Denver, that this will be one of the most largely attended conventions of the Association ever held in its history. From all present indications bee-keepers in California will have a good season; and we hope that many of them will feel able to be present and help form a national policy to be pursued with reference to the prices of honey throughout the United States. Denver is right in the heart of the great West, and where, I predict, the great bulk of the honey of the United States will be produced in the future.

The railroad rates promised are as low as we could ever expect to get; and now is the opportunity for the bee-keepers, west of the Mississippi at least, to get together in one grand convale, and I hope that there will be several from the East.

CONVENTION NOTICE.

The Eastern part of the Northern Illinois Bee-keepers' Association will hold their spring meeting at the residence of C. J. Cummings, 2½ miles northeast of Rockford, Ill., on Tuesday, May 20, 1902. All interested in bees are invited to attend. R. KENNEDY, Sec. Rockford, Ill., Rural Route No. 5.

Special Notices by A. I. Root.

SPECIAL EXCURSION RATE TO NORTHERN MICHIGAN VIA THE PERE MARQUETTE RAILWAY.

The Pere Marquette Railway will make a special fishing rate to Northern Michigan of one fare for the round trip, between May 1 and August 31. This will bring the round-trip fare from Toledo to Traverse City (locality I have been writing about) down to \$8.25.

THAT HUBBARD SQUASH SEED.

On page 153, March 15, I asked about the Hubbard squash seed we sold last season. I am glad to be able to say that, up to date, not a single customer has reported squashes not true to name; therefore we may reasonably conclude the seed was all right.

THE AMERICAN WONDER LEMON.

Two years ago I bought of Schmidt & Bottley, of Springfield, Ohio, an American Wonder lemon, about a foot high. Last season it bore about half a dozen lemons. While I was absent the first got into the greenhouse and made it drop part of its leaves and two lemons. The other four made handsome fruits, larger than any lemon in the market, and it seemed that the lemonade they made was ahead of anything else in the world. But that may be because they grew on my own tree. This tree is now loaded with bloom, and its branches would all lie on the ground covered with fruit if I let them bear so much; and, all together, I consider it a beautiful house-plant, hardy enough to stand quite a frost without injury, and very easy to manage. My first plant cost me 25 cts. They are now offered at 15 cts. each, or five for 50 cts.

SEED POTATOES.

We are all sold out except New Russet and New Craig, and the seconds are all gone of these. We can ship promptly, on receipt of orders, firsts, for \$3.50 per barrel, as long as they last. We have about 30 or 40 bushels of the New Russets, and perhaps 60 or 70 of the Craigs. The greater part of our seed potatoes for the coming year will be grown in Northern Michigan, Providence permitting; and we expect to have some nicer potatoes for our customers than any thing we have grown here in Medina for many a year. Perhaps I might say we have odds and ends of almost all varieties, so we can still furnish potatoes by mail, or perhaps half a peck or so of a kind, by express or freight.

SHALLOTS, OR POTATO ONIONS.

For some years we have been sold out of these onions, so we have not even advertised them. Now, however, we have a nice lot of about three bushels which we can sell at the following prices: Small ones, from the size of a hulled walnut down, 15 cts. a quart; 90 cts. a peck; \$3.00 a bushel. I really do not know the difference between a yellow shallot and a yellow potato onion. They look so near alike and act so much alike I should be inclined to call them one and the same thing. (Our old Whittaker onion is also the same, only it seemed to make a bigger onion.) The small sets, when planted alone, will produce one or two large onions; but the larger ones, when planted, will break up into small sets, producing all the way from half a dozen to a dozen or even two dozen in a hill. They are very hardy, and will usually winter outdoors all right; but when kept in a dry cold place over winter they are the best keepers of any thing in the onion line; in fact, ours are as hard and firm as when they were first gathered, and there is not a sprouted one in the lot. If wanted by mail, add 10 cts. per lb. for packing and postage.

THE GRAND TRAVERSE HAND POTATO-PLANTER.

I notice the manufacturers have changed their directions for using the planter, slightly, for this year. The new directions read as follows:

"It is very important in planting potatoes that they be placed in moist soil and covered before the soil dries out. This the Acme planter does perfectly. Ordinarily the holes are made, or furrow turned if horse is used, and the soil exposed to the hot sun for the day. The soil soon dries. Next the sets are dropped, and perhaps they are left to blister in the sun; they are then covered at unequal depths.

"DIRECTIONS FOR USE.

"Carry the planter with the horizontal arm or lever across the row you are following. When putting in the seed raise the planter to the left hand. *Do not stoop.* Put the planter into the ground with the foot *stepping squarely on the hopper, not on the lever;* keep the foot on the planter while throwing the handle to the left, which releases the seed, then raising the planter you naturally step on the hill, which firms the ground.

Carry the seed in a sack, as shown in the cut. It is very important to have the right kind of sack; it should be about 20 inches wide and 14 inches deep. A common grain bag makes three good ones. The strap for carrying it should be fastened about three inches from each edge of the bag. Carry the bag high enough so that the bottom can be easily reached. *Do not make the bag too deep.*"

From what we used the machine last year I am inclined to think the above directions are rather an improvement on those we gave a year ago, especially in regard to keeping the foot on the planter while throwing the handle to the left.

Please remember the new prices: One planter, 60 cts.; 3 or more at 55 cts. each; half-dozen or more, 50 cts. each; one crate of a whole dozen, \$5.25.

FOR SALE.—2000 lbs. honey, buckwheat mixed, 7c, freight paid; in 60 lb. cans, 2 cans in case.

B. F. AVERILL, Howardsville, Va.

Victor's Strain of Italian Bees Awarded the Diploma as Being the Best Bees at the Pan-American.

BUREAU OF AWARDS.

PAN-AMERICAN EXPOSITION,
BUFFALO, NEW YORK U. S. A.
February 12, 1902.

Mr. W. O. Victor, Wharton, Texas.

Dear Sir:—I have the honor to advise you that a Diploma of Honorable Mention has been awarded to you for your exhibit of Italian bees at this Exposition.

Very respectfully, WM. I. BUCHANAN,
Director-General.

Orel L. Hershisier Bought of Me an Untested Queen. This is what He Says of Her Colony:

"They are very industrious, characteristically marked, and extremely gentle. It was a daily experience, and repeated many times daily, to go into the inclosure with interested visitors, at the Exposition, open the hive, full to overflowing with beautiful bees, the progeny of the queen you sent me, and handle them in the various manipulations of hunting out the queen; shaking the bees from the comb, as is done in extracting, showing the brood in all stages, etc., all without the use of a smoker or any thing else to quiet the bees, and I do not recollect that any one ever got a sting from any of them."

Of the bees I exhibited at the Pan-American, he says: "The nucleus you sent for exhibition and award was certainly very fine-looking bees, and, in my opinion, they deserve the award given them by the judges."

But Who is Mr. Hershisier?

See *Gleanings* of date of Feb'y 1, 1902, page 97. Send in your orders for queens, and in a short time, as Mr. Hershisier and hundreds of others are now doing, you, too, will be singing the praises of "Victor's Bees." Price lists on application.

I Am Filling Orders by Return Mail from This Superior Stock at Following Prices:

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

W. O. VICTOR, Wharton, Tex.
Queen Specialist.

200-Egg Incubator for \$12.80

Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
GEO. H. STAHL, Quincy, Ill.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, thus: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My nice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present. —M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albino, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Fees by the pound, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

The Jennie Atchley Co., Beeville, Tex.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 881 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel, stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

BUFFALO.—There is very little demand for honey. Prices do not change much and still the prices would be cut to effect sales. Fancy white comb, 14@15; A No. 1, 13@14; No. 1, 13@13½; No. 2, 12@13; No. 3, 11@12; fancy dark, 10@11; No. 2, 8@9. Extracted white, 6@6½; dark, 5@5½. Beeswax, 28@30.

W. C. TOWNSEND,

April 19. 84, 86 West Market St., Buffalo, N. Y.

BOSTON.—With the approach of warm weather the demand for honey is easing off. Stocks are not heavy and the price is fairly firm at last quotations, which were as follows: Fancy, 15@16; A No. 1, 14@15; No. 1, 13@14; honey in glass-front cases about 1c less. California light amber, extracted, 7@7½; Florida honey in barrels, 6@6½.

BLAKE, SCOTT & LEE,

April 18. 31, 33 Commercial St., Boston, Mass.

SAN FRANCISCO.—Comb honey, 10@12. Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 27½@30. Honey is in light demand, but as holdings are not heavy values are well sustained. There was shipped this week, to Hamburg, 1537, and to London 4900 lbs. of wax. E. H. SCHAEFFLE,
April 11. Murphys, Calif.

DENVER.—Considering the time of year we are having a good demand for strictly No. 1 white comb honey at from \$2.50@2.75 per case. We are now practically cleaned up on this grade. Off grades and honey which is partly candied is not in demand, and is offered at \$1.75@2.25 per case. Extracted No. 1 white, 7@7½. Beeswax, 24@26, and scarce.

COLORADO HONEY-PRODUCERS' ASS'N,
1440 Market St., Denver, Col.

April 20.

CINCINNATI.—Stock of comb honey is here larger than it ought to be this time of the year, and this has caused that it is offered at very low figures. Water-white is sold at 14@14½, and hard to obtain; extra fancy, 15. Extracted finds a steady sale, and amber is sold in barrel lots for 5@5½; water-white alfalfa, 6@6½; white clover, 6½@7. Beeswax, scarce, 30.

C. H. W. WEBER,

2146 Central Ave., Cincinnati, Ohio.

April 18.

CHICAGO.—The season in which comb honey sells prior to the new crop is now practically at an end; therefore prices are more or less irregular, as some sections in a case will be grained more or less, and others free. The best lots of basswood and clover sell at 14@15; other kinds of white, 10@13; ambers, 9@12, and not in heavy supply. Extracted white, dull, 5@6½, and amber, 5@6, depending upon flavor and other qualities. Beeswax scarce, and wanted at 32.

R. A. BURNETT & Co.,

199 South Water St., Chicago, Ill.

April 18.

WANTED. Comb honey in any quantity. Please advise what you have to offer. EVANS & TURNER,
Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

WANTED.—Extracted honey, either large or small lots; parties having same to offer, send samples, and best prices delivered, Cincinnati, O. We pay cash on delivery. THE FRED W. MUTH CO.,
Front and Walnut Sts., Cincinnati, O.

WANTED.—Comb honey in Danzenbaker sections. We can use both white and amber. THE A. I. ROOT CO., Medina, Ohio.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more. WM. MORRIS, Las Animas, Col.

FOR SALE.—Extracted honey, from alfalfa, at 7c per pound. Send for sample. D. S. JENKINS, Las Animas, Col.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.80, per case of two 60-lb. cans, net. ARKANSAS VALLEY APIARIES, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7c, in kegs and cans. DR. C. L. PARKER
Sta. A, R. F. D., Syracuse, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHHEIM,
1318-1324 Union Avenue, Kansas City, Mo.

MAIL ANY DAY.

Orders are now being booked for queens, untested and tested. Golden Italian selected tested, \$1.50. Breeders, \$2.50 to \$5.00. None better.

Victor's Strain of Italian Bees Awarded the Diploma as Being the Best Bees at the Pan-American.

BUREAU OF AWARDS.

PAN-AMERICAN EXPOSITION,
BUFFALO, NEW YORK, U. S. A.
February 12, 1902.

Mr. W. O. Victor, Wharton, Texas.

Dear Sir:—I have the honor to advise you that a Diploma of Honorable Mention has been awarded to you for your exhibit of Italian bees at this Exposition.

Very respectfully, WM. I. BUCHANAN,
Director-General.

Orel L. Hershiser Bought of Me an Untested Queen. This is what He Says of Her Colony:

"They are very industrious, characteristically marked, and extremely gentle. It was a daily experience, and repeated many times daily, to go into the inclosure with interested visitors, at the Exposition, open the hive, full to overflowing with beautiful bees, the progeny of the queen you sent me, and handle them in the various manipulations of hunting out the queen; shaking the bees from the comb, as is done in extracting, showing the brood in all stages, etc., all without the use of a smoker or anything else to quiet the bees, and I do not recollect that any one ever got a sting from any of them."

Of the bees I exhibited at the Pan-American, he says: "The nucleus you sent for exhibition and award was certainly very fine-looking bees, and, in my opinion, they deserve the award given them by the judges."

But Who is Mr. Hershiser?

See *Gleanings* of date of Feb'y 1, 1902, page 97. Send in your orders for queens, and in a short time, as Mr. Hershiser and hundreds of others are now doing, you, too, will be singing the praises of "Victor's Bees." Price lists on application.

I Am Filling Orders by Return Mail from This Superior Stock at Following Prices:

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

W. O. VICTOR, Wharton, Tex.

Queen Specialist.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must say you want your adv't in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax. O. H. HYATT, Shenandoah, Iowa.

WANTED.—Comb honey in Danzenbaker sections in exchange for supplies, or will pay cash. We prefer large lots of white honey, but can use some amber in this size. THE A. I. ROOR Co., Medina, Ohio.

WANTED.—To sell Rocky Ford cantaloupe seed. Seed of these famous melons postpaid, 40 cts. per pound. Choice selected stock. H. F. HAGEN, Rocky Ford, Colorado.

WANTED.—To know who has 200 colonies of bees to sell cheap; also what young man would like to serve an apprenticeship with Quirin the queen-breeder. H. G. QUIRIN, Parkertown, O.

WANTED.—To exchange New Cumberland black-raspberry plants (Cuthbert), Fay's Currants, blackberry (Snyder, Taylor, Western Triumph), for beeswax at 30c per lb., or cash. Wanted, old comb and slumgum. A. P. LAWRENCE, Hickory Corners, Mich.

WANTED.—To sell 500 brood-combs, just a little larger than the Hoffman frame, at \$8.00 per 100, f. o. b. at Petoskey. R. B. OLDT, Epsilon, Mich.

WANTED.—One dollar for 15 W. P. Rock eggs; \$3.00 for 50, or \$5.00 for 100; from 93 to 95 scoring birds; cockrels and pullets, \$1.00 each; 75 cts. for one Golden Italian queen, or \$8.00 per dozen—after August 1st, 50c each or \$5.00 per dozen. GEO. W. COOK, Spring Hill, Kansas.

WANTED.—Bee-keepers to study our advertisement and testimonial of queens in April 1st *GLEANINGS*. R. F. HOLTERMANN, Manager Bee Department, Bow Park Co., Limited, Brantford, Canada.

WANTED.—To exchange a Belgian rifle for offers. R. J. CARY, R. F. D. No. 42, Norwalk, Conn.

WANTED.—To exchange the unbound volumes of *GLEANINGS* from 1882 to 1901, for books or any thing of value. J. F. NIEMAN, Woodville, Ohio.

WANTED.—Position, by a young man of 21, to assist in apiary; have had some experience with bees and factory work; temperate habits; good reference. JOHN TITE, Robinson, Quebec, Canada.

WANTED.—Some one to move into this vicinity and take 12 or 15 colonies of bees on shares. Bees are in Dovetailed hives, and in good condition. Or will sell. Write quick to H. J. SCHROCK, Goshen, Ind.

WANTED.—To sell for cash, 5-gal. square tin cans, used for honey, at about half price of new cans. Also elegant exhibition 12-lb. no-drip honey-cases for plain Danz. and $4\frac{1}{4} \times 4\frac{1}{4}$ sections; made for Pan-American. For prices and particulars address

OREL L. HERSHISER,
301 Huntington Ave., Buffalo, N. Y.

WANTED.—Second-hand or knocked-down hives. Describe them, with price. Also want a man who knows how to handle bees a little.

W. L. COGGSHALL, West Groton, N. Y.

WANTED.—To sell in May and June, three 1-lb. frame nucleus with good queen, free from disease. Italian bees. C. S. YOUNKIN, Confluence, Som. Co., Pa.

WANTED.—Correspondence with person desiring apiary of 38 colonies, and all up to date applications for conducting same. A bargain for cash. EVANS E. EWING, Rising Sun, Maryland.

WANTED.—Beeswax, typewriter, and wheel-hoe and drill. Send for long list of articles to select from in exchange. F. H. MCFARLAND, Hyde Park, Vt.

WANTED.—To exchange brood foundation for beeswax or offers. FRED W. BUTTERY, R. F. D. 43, Norwalk, Conn.

No. 9

A CORRESPONDENT wants to know if I think a supersedure queen best of all queens, and, if so, why. I don't know; but I have an impression that a supersedure queen is no better than a queen of the same colony raised at swarming time. If a colony should for several years refrain from swarming, renewing its queen at proper intervals by supersedure, I should have some preference for such a queen because of its non-swarming blood. [That is orthodox for our locality.—Ed.]

E. LAGLAINE says in *Revue Eclectique* that bees occupy old combs only when they can not do otherwise, preferring to build new. It passes my comprehension to understand how the experience and observation of others can be so different from my own. Over and over again I have had the strongest proof that the bees preferred old combs to foundation or empty space, or even fresher comb, and I have yet to see the first case in which any thing else was preferred to old comb, unless the old comb was moldy or otherwise in bad condition. [So here.—Ed.]

LARCH LUMBER, says *Illustrirte Monatsblaetter*, is not suitable for hives, among other reasons because the wood is not sufficiently porous for good wintering. If that is so, it supports Doolittle's contention that hives should be unpainted. [Larch is a species of pine; and I find by the Century Dictionary that the wood is tough, buoyant, and elastic; but there is no wood in the world that quite equals the northern white pine, such as we get from Michigan and Canada. The yellow pines are pitchy, heavy, difficult to work, and do not give the satisfaction that the white does. But in Arizona and California, redwood, a species of cedar, has the preference in certain localities to even white pine, for hives. It seems to be especially adapted to a hot dry climate.—Ed.]

BLACK BEES are in better repute across the water than on this side. *Illustrirte Monatsblaetter* says the best bees are the natives, and next to them the Carniolans. [On this side the average honey-producer would just as soon have hybrids (a cross between blacks and Italians) as the pure Italians. They will certainly get as much and possibly more honey, but they are not so pleasant to handle. Black bees are very much inferior to either so far as the amount of honey is concerned. Years ago, when we had about 25 colonies of such bees in the apiary, it was very plain to be seen that the Italians would outstrip them; and this was especially so when it came to the red-clover season.—Ed.]

FOR THOSE who must find queens each spring so as to know whether the clipped queen is still there or has been superseded by a queen which must be clipped, it is well that the work be done as soon as the weather is warm enough. It is much easier to find a queen in a small colony than after it has become overflowing with bees. On the other hand, it is frequently the case that, in a very weak colony, it is almost impossible to find the queen. I don't know why. [Yes, indeed; now is the time to clip queens' wings. It is penny wise and pound foolish to put it off till the busy season, when the hives are boiling over with bees, and when it may sometimes take an hour to find a queen. One can clip ten queens now where he can clip one along about the middle of June.—Ed.]

CARL F. BUCK says, p. 329, that I "claim that alfalfa does not yield honey except on irrigated land." Not quite that, friend Buck. It was not so strong as a claim; only a question, and that with no reference to irrigation. I supposed it would yield on unirrigated land, for I think I have read of the difference in the yield on irrigated and unirrigated land close by. My question was whether it would yield east of the Rockies—a question I should not have asked, for I knew it yielded east of the Rockies in Colorado. What I suppose I had in mind—a question still in order—was this: Does alfalfa yield honey east of the Missis-

issippi? [So far I have yet to hear of alfalfa yielding honey east of the Mississippi; and it was a surprise to me that it did so in any locality not irrigated. I refer to what Carl F. Buck says of its yielding honey in Kansas.—ED.]

MR. EDITOR, you say you marked locations, so that, when you put out bees a month later, you can put them on same stands. I wish you would change location of a few, so as to see just how much harm would come of it. Some say they will get mixed if put on wrong stands, even after being in cellar all winter. It never seemed that my bees clung so tenaciously to old locations. This year I set a colony near the cellar on taking out. It flew that day, and, after standing there a week, I took it down to the apiary. The first day it flew, perhaps ten days after its first flight, it seemed to mark its locality anew, and I don't know that any bees were lost. [Perhaps you are right; but we determined to be on the safe side; but if bees after a confinement of ten days will mark their locations anew, then the fact is a matter of importance on the score of convenience if nothing else.—ED.]

A TRICK in transferring, new to me, is given in *Revue Eclectique*. Lay your empty frame on its side; drive into the side of the top-bar seven or eight small nails, leaving the heads projecting $\frac{1}{8}$ inch. Likewise drive an equal number in the side of the bottom-bar. Take very fine wire and fasten one end to the first nail above; pass to the first nail below, take a turn and pass to the second nail below, then successively to the second nail above, third nail above, third nail below, fourth below, fourth above, and so on, fastening on the last nail. Turn your frame over and lay combs in it, then put over the combs another series of wires, and there you are. [My, oh my! That would be a lot of work; and how much better would it be than a string or thread wound around the frame of combs? The string, the bees will take off of their own accord if the apiarist is too lazy to take it off after the combs are fastened; the wire—that would have to be taken off very laboriously; and those nails! how nice (?) they would be for uncapping! Give the fellow that got that up a leather medal.—ED.]

I THREW BRICKBATS at F. B. Simpson because he said we mustn't breed from freak-best queens. The *National Stockman* furnishes a brickbat that might come whizzing about my ears if he should happen to see it. It says: "Most breeders will endorse Mr. Gormley's position that speed without a speed inheritance is not likely to reproduce itself; and that for breeding purposes the inheritance without the standard speed is preferable to the speed without the inheritance." Well—yes—or—but, say, F. B., bees are not horses—that is to say, you can't control the mating, and so you never can be sure of inheritance; and so long as

you are perforce compelled to forego inheritance, it is better to breed from the best performers in the hope that at least something of their good qualities will be inherited by their royal offspring. [There is the trouble—the control of the male parentage. In our own experience, breeding from our best queens produces a superior class of daughters—no doubt about that. A principle that may be true in the breeding of horses may not hold good in breeding queens.—ED.]

THE WIND is a factor in wintering that is not sufficiently considered. Some speak as if an increase of latitude must make an increase in the severity of the winter. The isothermal lines do not by any means keep company with the parallels of latitude. The wind may cut more figure than either. Where I live, the wind thinks nothing of keeping up a lively gait 24 hours at a stretch, with the mercury not far from zero. I can easily imagine a place 500 miles further north, and a good many degrees colder, where it will be easier on outdoor bees than in this windy locality. [It is not much wonder to me that Dr. Miller has never been able to make a success of outdoor wintering in his locality. A lively gale of wind for 24 hours on a stretch, with a zero temperature, is something we do not have in Medina, for perhaps more than one day in the winter, although we may have several days of high wind when the temperature is 20 above; but these are liable to be followed by a warm spell, and it is not an unusual thing during the winter for bees to have a flight. Notwithstanding, however, we have made a great success with outdoor wintering at Medina, I am coming to the conclusion that the indoor method even here will be more economical in the consumption of stores, and give us stronger colonies for the honey-flow. I may change my mind; but that is the way the straws round about Medina blow just now.—ED.]

ONE OF THE THINGS fully settled long ago was that it is a bad thing to put bees out of cellar for a flight and then return them. Having tasted the pleasure of the free air they would not again be content to be imprisoned. Now, Mr. Editor, you've gone and unsettled the whole business again by what you say on p. 323. Please tell us minutely as to the final result. Also tell us when you took out, returned, and took out for good. There have been times when I felt I'd like to give the bees a flight, and then return them to the cellar; but I had too strong respect for traditions. [I think we have proven, to our own satisfaction at least, that the old idea that indoor-wintered bees should not be given a flight on some warm day in midwinter, is not good practice for Medina. In a normal state of health, bees are compelled to void their excreta at certain regular intervals. We know that they do retain them during the winter; and we know that, just as soon as they are set out, the first thing they do

is to spot every thing in the neighborhood. This goes to show that Nature has been pent up for a long time, and seeks relief. To give the bees a cleansing flight during winter is not only rational but humane. We managed to keep our bees quiet till about the latter part of March. Then we set them out and let them have a cleansing flight and put them back again, and then they are perfectly contented—no doubt about that. See editorials.—Ed.]

What joyful scenes around the hives
The springtime brings to sight!
Great clouds of bees sweet tribute bring
Like offerings of delight.

AMERICAN BEE JOURNAL.

Mr. York tells a good one in regard to manufactured comb honey. Rev. A. E. Taylor, of York Co., Pa., wrote to Mr. York that he had read in the Philadelphia *Record* a denial of the assertion that comb honey can be manufactured, and that \$1000 had been offered for a sample of said honey, and adds the following:

I send it, first, to say that I manufacture comb honey; and, second, to say that you had better call in your offer, if you made such, as some one may claim it. I do not claim any reward.

I manufacture comb honey because—first, I get honey in that way, whereas I would get none otherwise; and, second, I get a better product. A. E. TAYLOR.

Mr. York immediately sent for 2 lbs. of said honey, but got the following instead:

MESSRS. GEORGE W. YORK & CO.—

Yours of the 6th at hand. I do not pretend to "manufacture comb honey by machinery, without the aid of bees." That would imply that I am a creator or secreteur of wax, and I do neither; that I construct comb; that I make a chemical change in the compound of sugar and fruit, which I give them, into honey. It would be as if a ranchman raised cattle without breeding-stock. Such an effort would result as did Aaron's effort at making a god.

You would be safe in adding six units to the offer, for since the world began man hath created nothing; nor hath he entered into the secret of insect architecture; all the paper-makers together could not make one hornet's nest.

I prepare the material out of which bees give me a product which the best judges of honey pronounce superior to the natural product in both taste and keeping quality. A. E. TAYLOR.

Mr. York winds up with the following:

And so endeth another boaster. In his first letter to us he distinctly said, "I manufacture comb honey." In his reply he says: "I do not pretend to say I manufacture comb honey," etc. We wouldn't care to be compelled to sit under his preaching, and help pay for keeping him alive. He belongs in the mistaken crowd instead of the Taylor family. But, thank the Lord, there are few such as he among the preachers.

But we will not "call in" that offer of \$1000 just yet. We prefer to wait and let a few more ignorant ones bite on it. It's pretty good bait—a genuine offer. And we are not afraid of being called on to pay the money, because there is no such thing as manufactured comb honey—made without the aid of bees.

Wasn't Mr. Taylor indulging in a little "scientific pleasantries," after all? or per-

haps we might call it sarcasm toward those who think comb honey can be manufactured by man. Although the last paragraph sounds a little mysterious, no one has stated in more satisfactory language than he the impossibility of making comb honey artificially.

Adrian Getaz says, "Put a piece of wood in the fire and burn it. You say it is destroyed. No, it is not; it is only transformed. A part of it is now ashes, and another part smoke and gases." Yes, the wood is destroyed and annihilated, as that consisted of a combination of elements; and when that combination was destroyed the wood went with it. The elements, of course, were not destroyed, but simply separated.

In reply to a correspondent, Dr. Miller restates what may be a well-known truth; but as I believe many will understand it more perfectly after reading his definition I give it here, as it is too plain to be mistaken:

All the eggs of the queen are unimpregnated as they leave the ovaries. In its outward passage the egg is impregnated as it passes the seminal sac or spermatheca if the egg is destined for a worker-cell or a queen-cell. But if the egg is destined for a drone-cell it is not impregnated. In the absence of a queen, workers sometimes undertake the business of egg-laying; but their eggs, not being impregnated, produce only drones, even if laid in worker-cells.

BEE-KEEPERS' REVIEW.

In the April issue Mr. Hutchinson has the following to say in reference to the stories about artificial comb honey:

Mr. F. B. Simpson suggests that we make a mistake in not taking the public into our confidence in this matter. We simply say that the manufacture of artificial comb honey is impossible, but that is as far as we go. A great many people feel sure they know that it can be done—they have seen the artificial comb and the machine that made it (?). What they have seen is comb foundation and the machine by which it is rolled out. They have seen it at some bee-keeper's, or at some fair, and have not thoroughly understood—have simply gotten a superficial idea of it, and then when they read some of these manufactured stories about manufactured honey, they put two and two together, and that ends the matter in their opinion. Mr. Simpson thinks we should explain, in our refutations, the nature and use of comb foundation. We should tell the whole truth about the matter, and not simply deny.

I found an obstinate case of this kind at the Pan-American Exposition, especially as the "case" was a woman. She knew all about it—had seen the pictures, etc.; but after showing her just what Mr. Simpson advises, she immediately saw the truth and admitted she was wrong. Every grocer should be provided with a section with a sheet of foundation in it, and another one filled with empty comb. These would offset any newspaper fake ever printed. As long as people know that man has something to do with making comb they will feel sure he can make the whole thing till shown otherwise. "Taking people into our confidence" is, as Mr. Simpson suggests, the best way out of the trouble.

HIVING SWARMS HAVING QUEENS WITH CLIPPED WINGS.

"Good morning again, Mr. Doolittle. I have been thinking over what we talked about the other day regarding swarming with clipped queens. I did not know that I fully understood the matter, so came over again to see if you would not tell me a little more fully the particulars in the matter."

"Glad you came, Mr. Smith, for I touched but lightly on the managing of the swarms, as we were more particularly discussing whether it was best to clip or not."

"But do you really think that you can have a swarm easier where the queen is clipped than you could one having their queen flying with them, were it not for the risk of their going off to the woods?"

"I certainly do. The ease with which natural swarming is conducted, where all of the queens have their wings clipped, is one of the greatest reasons I have for clipping queens' wings. Because the queen has her wings clipped, it does not follow of necessity that the swarm must be hived on the returning plan which I outlined a little the other day."

"But is not the queen likely to get lost in this swarming process, or stepped on when you are trying to find her?"

"No, I do not think so, although some have written that way. In an experience covering over thirty years, with nearly every queen's wing clipped in my apiaries, I have yet to step on or lose the first queen, from any cause arising from her having a clipped wing. In fact, I am so well pleased with the plan of natural swarming with queens' wings clipped, after trying all other plans used in such natural swarming, that I would as soon think of going back to the old box hives as to return to the old way of letting the queens have their wings as nature made them."

"That is saying a good deal. And now suppose you tell me a little more fully about that returning plan you spoke briefly of the other day."

"I will try to do so, for there are some items which sometimes bother people that I did not touch upon. When a swarm is seen issuing, I (or Mrs. D.) step to the rear of the hive and then look on the ground to the sunny side (you can always see the best with the back to the sun, especially if you have a bee-veil on) of the same to see if there are many bees there, thereby indicating the presence of the queen; and if not, which is usually the case, step up on that side and glance over the ground in front of the hive. If the swarm has nearly done issuing, the queen is readily found by a little cluster of bees being about her. If just commencing to swarm, look at or near

the entrance where she will be seen running as soon as she comes out."

"But you said something about a wire-cloth cage the other day, did you not?"

"Yes. Have on hand a round wire-cloth cage $1\frac{1}{2}$ inches in diameter, by 6 or 8 inches long, made by rolling a piece of wire cloth around a stick and sewing the sides together with a wire raveled from the same, when a stopper is fitted into each end—one permanently, the other removable. As soon as the queen is seen, hold the open end in front of her in such a way that she will run up into it, and immediately hold the open end in front of the entrance so that the outgoing bees of the swarm will run in with her to the number of from 20 to 50. These bees help much in caring for her, and to bring the swarm where you want it. If the bees are through running out, then you can get the little cluster which gather about her in the cage with her."

"What about moving the hives?"

"As soon as you have secured the queen, lay the cage down in front of the hive, when you will move the old hive back, and put in its place the one which the swarm is to occupy, when the cage with the queen is to be laid near the entrance. Place the old hive where you wish it to stand, or move it up beside the new one at right angles, *a la* Heddon, as you prefer. Have, in a convenient place, two sheets, one of which is to be placed on each of the hives on either side nearest the one now awaiting the swarm, so that they can be spread over them should the swarm attempt to enter these hives upon returning, which they very rarely will do if only one swarm is in the air at once, and if the caged queen and the bees with her is left at the entrance of the new hive. When about two-thirds of the bees have returned and entered the new hive, pull the stopper out from the cage, which liberates the queen, when all run in together. If the queen is allowed her liberty as soon as the first bees run into the hive, the whole swarm will sometimes take wing again, and this is the reason that we wait about giving her her liberty till at least two-thirds are settled in the hive. If several swarms come out together, more sheets are needed, so that, if more than the right proportion of bees draw toward one of the new hives placed on the old stands, a sheet can be thrown over for a little until the bees are drawing about alike to all."

"When we first began you hinted at another way of managing these swarms having clipped queens beside this returning plan."

"Yes; and a very simple plan, and one preferred by many, is the following: Go to the woods and get a light tough pole, or, what is better, three or four of them of different lengths, the shortest being about 8 feet long, and the longest 20, sharpening the large end of each. If these are of bass-wood, and cut in June, when they will peel, they will be the lightest and strongest of any thing possible after being peeled and

seasoned. Now bore a $\frac{5}{8}$ or $\frac{3}{4}$ inch hole in the small end of each, when your poles are ready for one of the Manum swarm-catchers, sold by the publishers of GLEANINGS. As soon as you have the queen, and the few bees in the cage, drop this cage into the swarm-catcher; slip the pointed end of the iron rod which holds the catcher into the end of the pole which you think most convenient for you, and then hold this still open catcher up among the thickest part of the flying bees, when, in more than half the cases, they will begin to alight on it. When they are alighting so rapidly that the thing begins to get heavy, slowly carry to some tree near by, and lean the pole against one of the branches, and stick the sharpened end in the ground in such a way that it carries the clustering swarm out and away from the other limbs of the tree. The bees will soon all be clustered, when you can carry them where you please and hive them. If they begin to cluster on a limb, instead of on the swarm-catcher, wait till two or three quarts are clustered, when you will jar these into the catcher. Close the lid by drawing it over a limb, and bring it out from the limbs of the tree as before, when all will cluster on and about the cage and catcher, the same as if they had started to cluster on it before commencing on the limb. When you have them thus you can hive them at your leisure, resting assured that they will not leave their queen, no matter if you do not hive them till the next day."

"As I have a Manum swarm-catcher, I think I will try this plan in connection with the other. But I must be going."

I FULLY expected to continue the account of my travels through California in the present issue; but the engravers made a mistake and sent the wrong cuts, and I am, therefore, obliged to make a break in the series. They will commence again in our next issue, and I hope after that to continue my travels without a break until I get to the end of my long journey.

ELECTRIC RAILWAYS AND OUT-YARDS.

WE are expecting an electric railway to come by or near our premises. It already runs right through our basswood apiary, about a mile and a half north of us, and we expect to locate three or four more yards right along the line. The fact that the cars will be running every hour or so will enable us to send a man back and forth to the yards at an insignificant cost; and this will enable us to keep in close touch with the bees in several locations. As it is, our men can go down on one car to visit the

bees in the basswood orchard, and come back when they get ready.

A DISCOURAGING OUTLOOK FOR THE PRODUCER OF ALFALFA HONEY.

ELSEWHERE in this issue Mr. W. A. H. Gilstrap calls attention to the fact that some bee-keepers in California, on account of the growing tendency among the ranchmen to cut alfalfa before it comes into bloom, are obliged to migrate to other localities; that the alfalfa regions that were once splendid localities for the production of alfalfa honey are of no further use to bee-keepers. If it is indeed a fact that there is more money in cutting alfalfa before it blooms—that it makes a better hay, etc., the bee-keepers in the alfalfa regions will either have to quit business in time, or go where the alfalfa-growers are less up to the times.

BEEES NOT A NUISANCE; SO DECLARED BY JUDGE MONCK, OF HAMILTON, ONTARIO.

FOR some time an interesting case has been pending over across our border, in which the bees of a certain man were declared to be a nuisance, and damages asked in the sum of \$60.00. The case was hotly contested on both sides, but the decision of the court, as usual, exonerated the bees. The results are thus set forth in the Brantford *Expositor* of April 6:

The celebrated bee case of Brock vs. Patterson, from Lynden, has been disposed of, so far as Judge Monck, of Hamilton, and the fourth division court are concerned. His honor gave judgment yesterday, non-suiting the plaintiff.

After reciting the facts shown in the evidence, the judge went on to say that the keeping of bees—118 hives of them—by the defendant made the enjoyment of the plaintiff's property less agreeable than it would otherwise be; in fact, at times the bees were a nuisance to the plaintiff. Beyond that his honor could not find that the plaintiff had suffered any specific damage.

Concluding, the judge says: "I find the annoyance not such as to create a public nuisance. In many cases the individual must suffer annoyance for the general good; and I am in great doubt as to whether in this case the plaintiff is entitled to damages. As he has a remedy in a court of superior jurisdiction, in an action for an injunction, I direct a non-suit to be entered without costs to either party."

As that old war-horse, Thos. J. Newman, would say, "Score another victory for the bees." It is doubtful whether the plaintiff will appeal to a higher court.

Later.—A full account of the case is given in the *Canadian Bee Journal* for April.

THE TRUTH ABOUT BEE-KEEPING IN TEXAS.

MR. G. F. DAVIDSON, of Fairview, Texas, protests against statements made in two articles—one from H. H. Hyde, and the other from W. W. Somerford—in regard to Texas in our issue for April 1. Referring to Mr. Somerford's statement that Texas has a bad record back of it; that there are periods of dry years, periods of wet years, desolation and death, burning deserts strewn with dead and dying animals, no grass, venomous snakes, etc., all that, he says, is not true, and that I was correct in all I said about those bee paradises; and then

he gives numerous instances to show how home-seekers have gone there and made a good living.

With regard to what Mr. Hyde has to say about the bringing of foul brood into Texas, and that any bee-keeper who brought it there would be summarily dealt with, he wishes to say they are not going to hang the man who does it—that they will treat him right, and will expect him to do the same. He thinks there is no danger of overcrowding in the State, but condemns the practice of some bee-keepers who have located apiaries within a few hundred yards of other apiaries that have a prior right to the location.

A FEW FIGURES REGARDING SOME OF THE BEST HONEY LOCALITIES IN THE WORLD.

OUR honey-man, Mr. A. L. Boyden, has prepared a statement that I think will prove of interest. It reads: Comparisons of the honey crops of different States have been made by several writers lately, and we notice that Rambler, in March 15th GLEANINGS, estimates the California crop for 1901 at five million pounds, and concludes from the table of exports that Cuba produced as much as did California. In the *Pacific Bee Journal* for April we find the editor has given space to the Census Report, and by the heading of the article, "Only Texas Beats Us," we conclude that California acknowledges Texas ahead of them. Let us look for a little at the amount of honey produced per square mile in some of these countries according to the figures of the Census Bureau report of the exports from Cuba and Jamaica:

	Area in Square Miles.	Gross Yield. Per sq. mile.	Honey Produced Per sq. mile.
Texas.....	265,780	4,780,000 ¹	18 lbs.
California.....	158,360	5,000,000 ²	31 lbs.
Cuba.....	42,000	4,795,000 ³	114 lbs.
Jamaica.....	4,200	1,503,376 ⁴	358 lbs.

¹Census report for 1899.

²Rambler's estimate for 1901.

³Exports for 1901.

⁴Exports for 1901.

By the above table it will be noticed that Jamaica is way ahead of any of the other mentioned States per square mile, and their honey is of most excellent quality, too. We have just recently received a lot of their logwood honey, and it compares very favorably with our alfalfa, or sage, or white clover. It is fully equal in color to white clover, and has a very delicate flavor.

WHY THE GOVERNMENT STATISTICS WERE NOT TRUE AS RELATING TO CALIFORNIA.

REFERRING to the census report of bees and honey, the accuracy of which I questioned, Mr. Hutchinson, of the *Bee-keepers' Review*, says:

Mr. Root says the trouble is that statistics are not "gathered systematically in some States." As I understand the matter, the taking of a census is a systematic matter, carried on by enumerators appointed by the government, and furnished with proper blanks. I should expect that they would get as correct statistics in one State as in another. Mr. Root feels sure that California ought to rank first as a honey-produce-

ing State. He admits that Texas might come in second. It must not be forgotten that Texas is a large State—the largest in the Union—and is an excellent honey-producer.

What I had in mind more particularly was not that the government did not gather its statistics systematically, but in some States the work is done much more thoroughly than in others.

I made a trip through Texas, and through the entire length of California, and I should say that bee-keeping operations in the latter State are conducted on a far more extensive scale than in the former. It is true that Texas is a large State, and that it is coming rapidly to the front for comb honey; but in a fair year I feel sure that it can not begin to compare, even in the aggregate yield, with its sister State. Of course, I may be mistaken; but those who live in California are large consumers of honey; and yet from 200 to 300 carloads of honey may go east in spite of this large consumption; but we never hear of more than four or five carloads of Texas honey getting up north. There is this to be said in favor of Texas: Bee-keeping in that State is *more certain* than bee-keeping in California; that is to say, bees do well in Texas *every* year, while in California there are only about two years out of five that yield much honey.

The main reason why I questioned the California statistics was that they referred to a particular year. The year 1899 was selected as the one where the yields were reported for the several States. That was an off year for California—a decidedly off year, but it was a fair one for Texas, if I mistake not, as Texas generally has good seasons; so it can be readily seen how Texas might *seem* to outstrip California. But compare some of California's good years with Texas, and the latter will be found to be far behind. A set of figures, to be at all instructive or fair, should cover a period of years—not some particular year that will be good for one State and poor for another, as in the case already cited.

BEEES AS POLLINATORS IN GREENHOUSES.

THE following, written to Mr. W. F. Marks, President of the New York State Association of Bee-keepers' Societies, has been referred to me for reply:

Mr. W. F. Marks, Chapinville, N. Y., Dear Sir:—

Can you give me any information as to what extent honey-bees are used in greenhouses for the purpose of securing cross-fertilization of cucumber and tomato flowers? Where used successfully are they in large houses? Do the bees have to be fed, and do they store up honey? Can you give me the address of any greenhouse men who are now using bees for this purpose?

Thanking you for your trouble, I am

Very truly yours,
Geneva, N. Y., Mar. 29.

V. H. LOWE,
Entomologist.

I regret that I am not able to give any specific information. I can only say that I know that certain florists do make use of colonies of bees in their greenhouses to bring about cross-pollination on the flowers. So far as I know, the results have been much more satisfactory than pollination by hand.

Later.—Since the foregoing was in type the following letter has come to hand:

I have just sold two colonies of bees to go into cucumber hot-houses. I sold seven last year, and got about as much money for them as I did for the honey they made the year before. There are a good many colonies used up in this city and the adjoining town of Winchester in this way, and in Arlington. Mr. Rawson, of the latter place, last year had five acres of cucumbers under glass.

JOHN P. COBURN.

Woburn, Mass., Mar. 15.

The Mr. Rawson spoken of is W. W. Rawson, of Arlington, Mass., and is thus referred to in the *American Agriculturist* of Feb. 15:

How many stands of bees do you keep in a house 300 by 40 feet when cucumbers are fruiting? "Usually four stands are required for a single house, and they are put in just before the blossoms begin to open, so that they are ready for work as soon as the flowers are ready to receive them. Early in April the old stands are taken out and new ones put in. We contract for our bees at \$5 per stand and use about 50 stands each season. We usually lose about one-half the swarms, even after the most careful attention is given them. Many of them get out of the house through the ventilators, and are unable to return. Many others lose their lives in the house and various places; but we find it absolutely necessary to keep the house well stocked to insure fertilization and thus good fruit."

This will be a partial answer to Prof. Lowe. If any one else is in position to give us information along these lines we should be glad to hear from him.

GETTING THE EARS OF NEWSPAPER REPORTERS.

I HAVE been furnishing various newspaper reporters and magazine writers with information and photos relating to bee-keeping. I have not asked or expected that they would mention the name of The A. I. Root Co., but have requested all of them to mention incidentally something about the comb-honey lies, and to say that there is no truth in them. Several articles have already been published. The Los Angeles *Times* of April 13 prints two of my photos that I took while in California, showing M. H. Mendleson, his comb honey, and his beautiful apiary in Rattlesnake Canyon. The article is beautifully written, and, so far as I can discover, it tells plain straight facts about bees in Southern California; nor does it fail to say something about the comb-honey lies, which it nails most satisfactorily.

Another article is published in several of the dailies in this portion of the country, giving many interesting facts concerning bee-keeping, and tells how millions of pounds of honey are produced annually. It gives pictures of the hives of the olden days; of bees in a bee-cellar; of two modern apiaries; and last, but not least, a fine portrait of Rev. L. L. Langstroth, "the father of bee-keeping in America, who died a poor man."

I am personally acquainted with the writer of this article. In fact, I spent a large part of one day in telling some of the facts connected with our industry, and well has he told the story.

These articles, illustrated as they are, will be read by thousands of people; and I

am now in hopes that the "boiler-plate" makers will make extracts and scatter the truth broadcast over the United States.

There is nothing the general public need to know so much just now as that honey—real honest honey, both comb and extracted—is produced by bee-keepers to the extent of many millions of pounds. These stories about artificial comb honey, and the fact that carloads of honey are offered for sale, produce a feeling of distrust; and the truth intelligently told, that honey is produced on such an immense scale reassures the public. Our bee-keeping friends should get the ears of reporters whenever they can. Invite them to come and see you "handle bees like flies" and take off honey, and do not forget to sweeten them up with several nice sections of honey.

BEARING DOWN THE MARKET; INFLATION LIES FROM CALIFORNIA.

IN several of the daily papers I have seen references to the effect that "bee-men say that the California honey crop this year will be the largest that was ever gathered;" and there is a whole lot more of rosy statements to the same effect. While I believe it is conceded that there has been a fair amount of rain, and that the prospects are good for a fair crop, I do not believe that any sensible bee-keeper on the coast, if he stops and thinks a minute, is willing to be quoted as broadly saying that "the California honey crop this year will be the largest that was ever gathered." And yet in fact that is just what the papers do say.

I have been through California, and have studied the conditions somewhat; and from the amount of rain that has so far been reported I believe I am correct in forecasting that the next year *will not* be "the largest year ever known for honey." All plant life has had a setback in Southern California. The rains came too late in many localities to make the year a big one; for it takes Nature a little time to recover herself from a long-continued drouth. These statements of "unprecedented seasons," "veritable floods of honey in California," "biggest year on record for honey," and a whole lot more of the same ilk, are all being scattered broadcast through the daily press so they are circulated widely here in the East.

Just stop and think, brother bee-keepers of California, what all this means, and how it will be knocking off the profits of your labor. I believe the truth should be published; but for the sake of our own interests, don't tell *more* than the truth, thus destroying the chance of getting fair prices.

Early last season a lot of rosy statements were sent out broadcast, telling what a big year California was *going* to have. It *was* a fair year, but not a "big" one. But the effect of the inflation talk was a big slump in prices, for no one dared to make an offer. Such statements as these have a tendency to depress the honey market all over the United States, and as such they are most mischievous in their effect.

The bee-keepers of California should in some way get the ears or attention of every producer on the coast, and plaster up their mouths, if they do not know enough to keep still till we *know* what we are talking about. In the mean time, let every one "keep still and saw wood."

POST CHECK MONEY.

It is not often in these columns, especially in this department, that I refer to something entirely separate and distinct from the subject of bee-keeping; but here is something that is not only of great interest to bee-keepers but to every citizen of the United States, and I desire to interest the readers of GLEANINGS. I refer to the Post check-money bill which is now before Congress for consideration. In a word, it is to supplant or take the place of all the present paper currency, much of which is filled with germs of disease and filth, and substitute in its stead clean new bills that will be a great deal like our present money, with the exception that they are convertible into ordinary checks payable to certain specified individuals. There are blanks for your own signature, and for the one to whom the money is sent. Until these are filled out the bills will pass as common currency, like our present paper money. Now, then, when one wishes to send money through the mails, all he has to do is to take a bill out of his pocket-book, fill in the name of the receiver, attach his signature in the blank spaces provided, put on a postage stamp, and cancel it with the initials of the sender. This renders it payable to *only one person*—the one to whom it is sent, and no one can cash it but that person.

This new plan will be cheaper than postal orders and express money orders, and it is estimated that it will bring in a larger revenue to the general government than the present system. The fact that every bill will, in a very short time, find its way into the mails, will insure early cancellation and renewal. The result of all this will be clean crisp bills that are not defiled with all kinds of germs.

When you remember that money passes through the hands of all kinds of filthy persons, and those who are fairly reeking with disease germs, we wonder that the present system does not spread disease more than it does. By the new Post check money, all this will be avoided. It will then be possible for any one to pull a bill out of his pocket, convert it into a check, and send it anywhere in the country. He will remove very largely the temptation to rob United States mails, for no negotiable money will then be sent.

Now, then, if our readers desire to help foster this enterprise, let them write at once to their Senators and Representatives in Congress, urging their support, for the express companies will put in a powerful lobby to kill the bill, and it is, therefore,

necessary for thousands of people to counteract this influence at once.

RECIPES FOR MAKING HONEY CHEAPER THAN THE GENUINE.

THE advertisement below we find in the *Ventura Independent*. It seems a little strange that a man in Ohio should send away off to California to advertise his wares. Perhaps he thinks they do not have enough honey there to go round.

ARTIFICIAL HONEY.

Can't be told from the genuine. Costs about one-tenth as much, and gives you a big profit. Complete instructions for 25c, coin or stamps.

JAMES L. HENNING, Box 87, Bantam, O.

Below is the wonderful recipe for making honey that costs only a tenth as much as the genuine. It was written with a pen, and the writer does not even sign his name to it.

RECIPE FOR MAKING ARTIFICIAL HONEY.

Take 10 lbs. of brown sugar; add 3 lbs. of water, 40 grains cream tartar, and 3 lbs. of honey; 10 drops essence of peppermint. First dissolve the sugar in the water and take off the scum arising therefrom, then dissolve the cream tartar in a little warm water which you will add with a little stirring. Then add the honey. Heat to a boiling-point and skim it, then stir a few minutes.

The above is a fair sample of the artificial-honey recipes. By the way, why did not the editor of the *Ventura Independent* tell this man he could not accept such an advertisement? or doesn't he care what his advertisers say so long as he gets the trifling sum they pay for the insertion of their advertisement? I am ashamed of our State of Ohio. No wonder this town is called "Bantam" where this man lives. In his letter accompanying he asks for our advertising rates. He will not need them, however, for he will discover we have inserted his advertisement free of charge as above. We find Bantam is a little town of only 100 or 200 inhabitants.

Here is another recipe. It comes from the Home Remedy Co., St. Louis, Mo. They have a little book giving recipes for doing almost every thing, and declare they will return the money promptly if the customer is not satisfied. This is what the advertisement says:

Artificial honey is made all over the world, and sold as genuine bee honey, and no one can tell the difference. Our recipe was used by the greatest honey company in the world for several years, no one ever suspecting that it was not pure bee honey, and was only discovered by one of the chemists in their laboratory exposing them.

You can make this honey at a price about the same as the price of molasses. Try this and you will never be without good, pure honey.

Recipe with full directions, 25c.

And here is the wonderful recipe:

Brown sugar, 10 lbs. Water, 1 quart. Old bee-bread honey in comb, 2 pounds. Cream of tartar, $\frac{1}{2}$ ounce. Gum Arabic, 1 ounce. Oil of peppermint, 3 drops. Oil of rose, 2 drops. Mix and boil two or three minutes, then add one quart of water in which one egg has been beaten. As soon as it begins to boil, skim well; remove from the fire; and, when a little cool, add two pounds of pure bee honey, then strain. This will keep any length of time if sealed up when freshly made.

HOME REMEDY CO.

You will notice the foundation of these artificial-honey recipes is brown sugar; and

their recipe does make a sort of syrup; but the idea that no one can tell the difference between this and genuine honey is pure humbug. It must have been a wonderful chemist indeed who was unable (in his *laboratory*) to decide the stuff was *manufactured* instead of being pure bees' honey. Now, do not any of you waste money in buying recipes. Just send the advertisement to us and we will send the 25 cents, and then you can all have it free. See?

A. I. R.

WINTERING OUTDOORS AT MEDINA.

As I reported in our last issue, the bees at both our cellars came out in good condition; but those under the machine-shop, that had fresh air all night during the entire winter except during the coldest weather, were in much better condition than those in the outdoor cellar that did not have such supplies of fresh air. The out-cellar was built on the plan recommended by Mr. Bingham—a square cistern, as it were, clear under ground; but unfortunately it did not have the large ventilator recommended by him.

There was in this cellar some dysentery, and a good many dead bees on the cellar bottom—about the usual number. There was no dysentery in the home cellar except in one corner that did not get the usual circulation of air. The strange thing about it was there were three colonies in this corner, and every one of them had dysentery, while those bees that were right in line with the opening at the north end and the one at the south end, and which could get a strong current of air, were free from disease, and perfectly healthy. Our home cellar smelled as sweet as almost any living-room, and was just about as dry. Two or three times during the winter, however, Mr. Wardell sprinkled water at the entrances, and he says the bees came out and drank. In Mr. Doolittle's cellar the moisture given off by the bees condensed, and this the bees used over again. In a dry cellar such as we have in Medina it would seem that, if the bees need moisture (and I believe they do), fresh water right from the well would certainly be more wholesome than the condensed breath of the bees.

EARLY OR LATE SETTING OUT.

I mentioned in our last issue that we set out all the bees from both cellars along from the 20th to the last of March, and gave them one or two days of flight. The location of each hive was marked so that, when the bees were set out again, each colony would go back to its own stand. This may not have been a necessary precaution, but we felt that it was wise to err on the safe side. All the bees were kept in the cellar till along the first week in April. About 100 colonies or nuclei were set out of the home cellar, and left out. The rest were confined till about the 20th of April, when they were put out. But in this case Mr. Wardell thinks the first lot of bees are in

better condition than the second lot. The former have brood in all stages, while the latter have nothing but eggs, and it looks now as if the first bees had about two weeks' start over the others in brood. This seems to contradict my footnote on page 186 of this year, wherein I said I believed it was the best policy to keep the bees in until the first of May. A year ago, about this time, we set out some bees early, and some not till May. We thought the last lot of bees had the advantage over the others, because there was a storm on the 20th of April, and the snow lasted for several days, with a good deal of cold weather.

It is hard to tell just when to set bees out; but obviously it would have been better this year if *all* the bees had been set out about the first of April. Last year, the latter part of the month would not have been too late.

We have determined that we will do this: Next year we will set the bees out the first of April if the weather is suitable; and if it should turn cold we will put them back in the cellar and keep them there till it moderates again. And that reminds me that all our bees which we set out early, and put back, started brood-rearing; where it had progressed to a point beyond the egg stage it continued on, was capped over, and hatched out a fine lot of bees. So here is one more point in favor of giving the bees a week's flight in the latter part of February or early in March; for in our locality we are liable to have during these months a whole week of nice weather. This would give the bees quite a start in brood-rearing; then if the weather turns cold put them back, and the brood will be taken care of, and mature and hatch into bees.

As a rule there will be very little brood in a good bee-cellar. When the conditions of temperature and atmosphere are right, the bees should go into a quiet sleep and stay there.

I have already spoken, in answer to Dr. Miller, in *Straws*, this issue, of the advantages of giving the bees an early cleansing flight, and setting them back again. This of itself is a very important matter. While it entails some little labor, yet it does not mean more than the loss of two or three hours' time for 100 colonies.

THE RESULTS OF OUTDOOR WINTERING.

Our outdoor colonies did well; but they were the strongest and best we had in the whole yard last fall; and the loss out of the whole 300 that were outdoors was only two colonies; but the results were more remarkable with the bees under the machine-shop, because the greater part of them were nuclei. Some of them were very weak, and it was so late that we did not know whether all had even virgin queens or any queens at all. Our queen-rearing operations were conducted clear up till November. We did not, as usual, unite or double up, but kept the nuclei just as they had been used, and put them into the cellar just as they were.

The result was the loss of about three colonies. This loss was due to the fact that the bees were queenless, and not to any other cause that we could determine.

Some little time ago I attempted to take a flash-light of our bee-cellar under the machine-shop, but did not succeed in getting a good picture; but as it will give one a good idea of our cellar I show part of one end of it on page 382. The hives in the foreground are double-walled. When we found the bees were doing so nicely we put in some chaff hives. These, of course, were the first to go out in the spring. Those that show on either side are single-walled hives piled on top of each other. Each hive has its own bottom-board. Sometimes the body is pried up off from the bottom-board; but in the case of nuclei only the entrance is allowed.

The electric-lamp globe of which I have spoken is shown in the foreground. With this I can suddenly throw in a flood of light, yet it rarely caused any disturbance.

THE ONTARIO CO., N. Y., BEE-KEEPERS' ASSOCIATION.

Government Apiarian Work; Dr. C. C. Miller Criticised.

BY FRANK BENTON.

If Dr. C. C. Miller had read the report of the Ontario Co., N. Y., Bee-keepers' Association more carefully, as it is published on page 148 of the *Amer. Bee Journal* for March 6, 1902, he would likely not have misquoted as he did in *Stray Straws* in *GLEANINGS* for April 1, 1902, page 275. Dr. Miller says: "Ontario Co., N. Y., bee-keepers' convention thought what money our government expends in importing queen-bees from other lands might better be made use of otherwise." This he credits to the *Amer. Bee Journal*. But I find in the latter, the report, as given by the Secretary of the Ontario Co. society, Mr. F. Greiner, reads: "It was believed that we had just as good bees in America now as anywhere on the globe, and what money our government expends in importing queen-bees from other lands might better be made use of in the line proposed" (controlling mating). Then Mr. Greiner adds: "The Association did not take action on this proposition." From this it is plain, 1. That the Secretary, Mr. Greiner, was not reporting verbatim the proceedings of the Association, but was merely paraphrasing them in his own words; 2. That some member or members of the said society expressed the belief that "we had just as good bees in America," etc.; and, 3. That the Ontario Co., N. Y.,

Bee-keepers' Association did *not* see fit to adopt the view of some individual member or members as indicated above. Furthermore, it may be seen that a second attempt was made to get the society to indorse these views, for the Secretary says, further on: "The matter was brought up again by another member." But this, likewise, failed.

Notwithstanding all this, "the good Doctor" makes it appear in *GLEANINGS* as though the Ontario Co., N. Y., Bee-keepers' Association had whipped right around to his way of thinking. This is by no means the first time I have had to call attention to inaccuracies on the part of Dr. Miller. Want of time, and a disinclination to criticise in print, have often kept me from pointing out numerous other erroneous or loose statements recorded by him. Suffice it to say, that I believe when one is so inaccurate in his quotations, or seizes upon so flimsy an excuse to support his personal views, he is open to, and justly deserves, the severest criticism which due courtesy will permit.

In closing, I would also like to ask — not Dr. Miller — but the rest of the esteemed readers of *GLEANINGS*, if, in their opinion, it is the best taste on the part of the doctor to be so ready, as he seems, to throw cold water on any work in the bee-line that the government might sanction, or for him to rush forward with a bushel or two of propositions as to what he might think best should be done, when *he has not contributed a single effort toward securing national recognition in the form of appropriations for the benefit of the industry?* and when, almost single-handed, after many years of persistent effort, some little vantage-ground has been gained — vantage-ground that might have been reached years ago but for just such holding back, just such quibbling, or just such halting support — when something, at least, has been attained, I say, would it not be full more modest for the doctor (and I might add, also, for some others who are "in the same boat") to wait just a bit and see if what *he* and *they* want, as well as what "the other fellow" longs for, may not come to pass? Does he not fear to lose the half-loaf when he lets go to grab for the whole one? I state what I know to be a fact, that united and strong action ten years ago, in the line I then suggested to the officers of the North American Bee-keepers' Association at the Albany convention, would have placed these matters quite as far along as they now stand. But it would seem that one of the officers at that time, who might have taken hold and aided in pushing the work, has only recently awakened up to the fact, or at least made known, that he realizes the need of governmental aid (see the *Review* for February, 1902, p. 53), and he is now at the head of the National Association!

In the whole world there is not another county bee-keepers' society as widely and favorably known as the Ontario Co., N. Y., Bee-keepers' Association; and it is hardly

to be conceived that it would so suddenly conclude that its past persistent efforts in any given line of progress were all wrong, and that, vacillating at the behest of some member or two or three members, it would at once jump over to Dr. Miller's apparent view, that the best way to secure action in a forward line is to begin by quibbling as to just how the first step is to be taken! No; they are men of action, whose words are but to chronicle results. And what an example their unity should be for not only the National Bee-keepers' Association, but also every other one on this continent!

Washington, D. C.

[From what I know of Dr. Miller I am sure he did not *intend* to throw cold water on any work in the bee line that the government might sanction. Indeed, I know he has been much pleased with some things that have already been done through its apicultural investigator, Fränk Benton. I refer to the quietus he has given to some of the newspaper lies about comb honey. No man will do more to encourage government work than Dr. Miller, and if he has said something that looks like discouragement I know he will be glad to offer due apologies and to make amends so far as lies in his power.—Ed.]

HOME-MADE HIVES.

Experience with a Buzz-saw.

BY D. B. THOMAS.

I have been a bee-keeper for about fifteen years, with variable success, according as I cared for or neglected my bees. But I had one serious drawback, namely, I had to be my own pioneer, as no one who knew any thing about bees lived near to help me over difficult places; and the result is I have learned to *not* do many things as well as to do some others. It has taken a good deal of education in hive-making and buying to satisfy me, and I am still at it. A long time ago I bought two Dovetailed hives for comb honey, which pleased me so well that I bought forty next time, and for a while I bought and sold a good many. But a succession of off years knocked the bottom out of the honey business, and my bees died for want of proper attention. After a business once gets a good hold on a person, it seems, like a bad habit, to be next to impossible to shake it off; so three years ago found me relapsing into the bee fever, and I have been getting worse ever since. We have had extremely dry weather in this locality for two years, and, as a consequence, when a man has outwitted an elusive dollar he is slow to part company with it. For this reason I made my hives last year by hand, which, for ten hives, spring count, which were increased to twenty during the season, did not, of course, require a great deal of labor. They were run entirely for extracted honey; and although the season

was much the dryest we ever had, they netted me \$70, or \$7.00 apiece.

This spring a new condition confronted me. I must either make or buy about 40 hives for myself, besides supplying my neighbors. That would take about 80 dollars. I could not see my way clear to spend so much money at once, so I bought goods as follows:

1 combined saw, cost at home,	\$38.00.
1 lot of supplies, such as frames, fences, and sections, not easily manufactured at home.	- 30.00.
\$15 worth of lumber at \$3 per 100	15.00.

Total \$83.00.

By working like a Trojan I have the prospect of 50 hives in the future.

Candidly I no longer envy the supply manufacturer his hard-earned cash; and in order to carry my conviction still further I would sell my outfit at cost, for a buzz-saw is a veritable terror; and if I ever get rich on what I save I am afraid it will be at the cost of precious fingers.

Odin, Mo., April 1.

[As a general rule it does not pay any one to make his own hives; but there are localities remote from a dealer or manufacturer, and where lumber is reasonably cheap, where one can to advantage do his own work, providing, of course, he is a fair mechanic. Nearly every one who attempts to run a small circular saw finds out, sooner or later, that it will cut fingers about as easily as it does boards.—Ed.]

THE WINTERING PROBLEM.

The Truth of Some Old Teachings Questioned; How Much Ventilation do Bees Require? Moisture; Weather to Set Bees Out in the Spring.

BY DR. C. C. MILLER.

The wintering problem, which the Germans call the masterpiece (*Meisterstueck*) of bee-keeping, seems likely to remain of perennial interest to bee-keepers north of Mason and Dixon's line. I am watching with interest the outcome of the wintering at Medina in the cellar under the machine-shop and the other cellar. While we may not all have just the same advantages, the light thrown upon the problem by those two cellars may still be of general profit.

The present discussions in GLEANINGS as to winter ventilation remind one of the days of old, when a government document advocated burying bees, with no provision for ventilation, and when there were those who talked about blowing a candle through a two-inch plank, and about having colonies hermetically sealed.

I suppose no one will insist that impure air is a benefit to bees, although it comes pretty near it when it has been asserted that the least particle of outside air admitted during the latter part of winter will make the bees uneasy by reminding them

of the approach of spring. At any rate, it is held, and no doubt rightly, that fresh air may be admitted in such a way as to do harm.

Mr. Doolittle, on p. 187, refers to the sub-earth ventilator. I think I was one of the last to hold on to this. I became skeptical as to the quality of the air admitted through porous tiles, such as I had; and as it was the lazier way, to allow the pipes to become filled up, the combination of laziness and skepticism drove the sub-ventilator out of use. I am just a little afraid it would have been better if I had continued it. With continuous piping perfectly air-tight, preventing the possibility of the entrance of injurious gases from underground, I am strongly of the opinion that sub-ventilation is a good thing.

One trouble in deciding as to any one point in wintering is that the whole problem is a complicated one, and you can not separate that one point from the others. Mr. Doolittle winters as well since ventilation is given up; but does that prove that ventilation is of no value? May not a change of other factors account for success, not on account of, but in spite of, the lack of ventilation? and might not the success be still greater with ventilation? Because there has been good wintering in spite of the fact that at one time the air in his cellar would not support the combustion of a lamp, it would hardly do to argue that his bees would winter equally well if confined the entire winter in an atmosphere of such quality.

Mr. Doolittle speaks of his ventilation that would change all the air of a cellar in less than five minutes. A blast of air through a 6x8 aperture sufficiently strong to clear the cellar in less than five minutes might be rather too windy a situation for best wintering. If bees should winter well with a quiet and constant change of air, it does not follow that somewhere between that and a cyclone the danger-point might not be reached.

The idea that, when the admission of fresh air quiets noisy bees, it is because of the admission of moisture, has, I think, the merit of novelty; at least I do not remember having seen it advanced before. Some circumstances connected with the matter incline me to accept it, if I accept it at all, somewhat warily. I have been sitting, trying to recall some of the times when I have opened the cellar on nights when the bees were noisy. Sometimes the outdoor air was warmer than that in the cellar, sometimes it was colder — the result of opening doors and windows was always the same, quietness the next morning. Usually the air in the cellar felt more damp than outdoors, and, to my regret, there was sometimes a good deal more dampness in the hives than I believed best. Certainly not always, if ever, did the admission of outside air bring in moisture, yet it always brought quiet.

I never tried giving the bees water in the cellar for the express purpose of quieting

them; but I have tried it without any such purpose, and I never succeeded in getting any water taken. I don't know why, for I know others have succeeded. Just now the cellar is in an unusually dry condition, possibly because of the unusually dry condition of the soil after the terrible drouth of last summer. It is possible the bees may take water now. If you will excuse me a few minutes I'll go down cellar and see.

Yes. I took a rag dripping wet and put it in a cluster of bees at the entrance, and, while a number of bees ran aimlessly over the rag as bees do when disturbed, I could distinctly see three or four bees standing with their tongues protruded as if licking up the moisture. As this is the first time I ever saw any thing of the kind, it is probable that the cellar is drier than when I tried it before. But if unusually dry, that dryness does not seem to make the bees uneasy, for at this date, March 6th, they are very quiet.

The time of greatest uneasiness in the cellar comes late in winter or early in spring, when the outside air is as warm as the air in the cellar. No matter if the walls of the cellar be dripping wet, and drops of water be easily seen in the hives at the back end of the deep bottom-board, the bees are uneasy when the cellar is closed, and it seems to me the plain explanation is that, when the outer air is no colder than that in the cellar, it will not force its way in, and the foul air makes the bees uneasy.

I do not undervalue the importance of a correct and equable temperature; but along with it I believe a pure atmosphere is of great importance. In the pure atmosphere of the outdoor air, bees can endure great changes of temperature and a severe degree of cold; and they *do* endure it, as thousands of bee-keepers can testify.

My experience does not confirm the position Mr. Holtermann takes as to setting bees out early, p. 186. He seems to reason well that bees ought to do better for an early flight, and I have given way to that reasoning a number of times; but whenever I have taken bees out before the blooming of soft maples I have regretted it. Neither is it wise to take them out when soft maples bloom in years when weather is unfavorable. Repeatedly I have regretted taking bees out too early: I do not remember ever to have regretted taking them out too late. Notwithstanding the number of times I have taken them out too early, and the number of times I have regretted it, I again took them out early last year — March 18, eighteen days before the blooming of soft maples — and again I regretted it. It is *possible* that I will experiment no more in that direction.

Neither do I believe it wise to set out a few colonies at a time. If convenient — perhaps I ought to say if possible — I always set all of mine out the same day, and I have never seen any harm come of it. If I should take the plan proposed, and out of every 100

take out 7 or 8 each day, taking them out on favorable days, the 13 favorable days required for the purpose would make the last of them stay in the cellar, I am afraid, later than would be for their welfare. I am wondering whether friend Holtermann has different weather from mine, or whether, commencing March 15, he takes four to six weeks to get his bees out.

Toward the last of p. 186 it seems to me there is a flight into the realm of fancy. A considerable distance in that realm seems the idea that, shut up in a cellar, bees will smell pollen and nectar half a mile or even a sixteenth of a mile away. Still, I can not prove he is wrong, and Mr. Holtermann has as good a right to guess as I. He says:

"Activity means exhaustion of vitality; and when vitality is exhausted, instinct causes the bees to rear brood to replace the exhausted vitality." It has long been taught that breeding causes exhausted vitality; but that exhausted vitality causes breeding is new doctrine. If bees in May "rear brood to replace exhausted vitality," then when that vitality is replaced by young bees ought there not to be a let-up in brood-rearing? Instead of that, does not brood-rearing increase with vitality? and is not the season of greatest brood-rearing precisely the season when there is the least proportion of exhausted vitality? Instead of saying activity causes exhausted vitality and exhausted vitality causes brood-rearing, would it not be better to say that activity causes brood-rearing and exhausted vitality?

From the italics in your footnote, p. 187, Mr. Editor, some might think it desirable to keep bees in the cellar till after May 1. Would not that crowd the bees a little to get ready for white clover if the season should prove to be unusually early?

Marengo, Ill.

[The main portion of this article is answered in one of my footnotes to Straws, and in an editorial elsewhere, in this issue. With regard to the matter of fresh air, we must consider that bees are animals. The temperature of their bodies is about the same as ours or any warm-blooded animal. They require air; and while they do not breathe with the mouth, as we do, they have breathing-mouths or breathing-pores, and take in supplies of oxygen, the purpose of which is to enrich the blood, just as it does with us. I can not, therefore, see why bees should not have fresh air in cellars, and why they should not have fresh water—every thing fresh. If we can keep the temperature down below 55, and give them air every night when it is not too cold, it seems rational to suppose that, other things being equal, the conditions will be ideal.

I have been in our machine-shop cellar, where there were 300 colonies and nuclei, with the sunlight streaming through the doorway; yet so contented were the bees that light caused them no disturbance. I have gone in at other times, and turned on

an electric light, with the same result. Sometimes one bee would fly out, but the great mass of them would remain quiet.

The number of dead bees on the cellar floor was very small in comparison with the number on the floor of our out-yard cellar that did not have the same amount of ventilation. There was much more dysentery at the out-cellar, notwithstanding the temperature was more uniform. Even during warm weather, when it was 70 outside, it would be down to 50 inside. The bees at our out-yard had all the favorable conditions for wintering except *daily doses of fresh air*. An examination of this cellar showed the bees were quite uneasy, and thousands of them came out, and died on the cellar bottom. While the colonies wintered all but two, there was a general depletion in the aggregate number of bees. On the other hand, the colonies and little nuclei at the home cellar, with their daily supply of fresh air, retained their strength, and those that had a mid-winter flight, and got started to brood-rearing, actually came out stronger.

These experiments will be conducted, if any thing, on a larger scale next winter. We shall probably have one or two more cellars constructed, and in one of them, at least, we will confine the bees *a la* Doolittle, and leave them to see what becomes of them.—ED.]

CLIPPING QUEENS.

Stimulative Feeding in the Fall; Adopting the Langstroth Frame.

BY F. GREINER.

Different bee-keepers practice different methods in clipping queens' wings. Hon. R. L. Taylor said at an institute he would catch a queen by her wings with his right hand, and place her upon his knee. She would then immediately catch hold of the fabric covering his knee. With thumb and fore finger of his left hand he would grab her thorax sidewise. With a pair of scissors he would then clip the wings without there being any danger of cutting off legs.

Many bee-keepers have of late claimed that clipped queens come up missing more frequently than those not clipped. Some think the reason might be that, when a queen is held by the thorax, as in Mr. Taylor's case, her scent is slightly changed by this contact with man's fingers, when afterward the bees will regard her as a stranger. There may be some truth in this. Still, it does not explain why queens (clipped) come up missing months after the operation.

I do not think it best any more to handle queens by the thorax, when it can be avoided. It is not at all necessary to take hold of a queen by the thorax when we wish to clip her. I simply pick up a queen by her wings with my left hand, hold her a few inches above the frame-tops, and draw the

knife over the wings where they touch the end of my thumb, cutting off all the wings as closely as I wish. No part of her body has thus been touched except those remaining between my thumb and fore finger. She drops right back among her bees on the exposed frame-top, and is never molested. It is a very simple operation, and very quickly performed. The only thing to be watched is to get a good hold of her wings at the first grab. I am not sure but a queen may be injured holding her by one wing only. When caught in this way she has a notion of twisting or spinning around, which probably causes her intense pain. I thought I had lost a queen in this way last summer, for she seemed dead for five or ten minutes after I had released her. However, she was but paralyzed, and came to again later, and she may be in her hive now. Others to whom I related the incident thought the queen was simply frightened, which would not prove an injury to her. I have never before seen a queen show the effect of a scare in this manner when she was picked up properly.

When I fail to catch a queen properly I let her go again and make a second attempt later. The knife is the tool to use in clipping, for we always have one with us. The closer the wings are cut, the easier the queen may be found at any future time. The peculiarity of her appearance is a marked distinction between her and the other bees in the hive.

We are often advised by our best authorities to so manage our colonies as not to produce any bees that can become only consumers. Then, again, we are advised to stimulate our bees in the fall after the honey season by daily feeding in small doses, so that our colonies will go into winter quarters with plenty of young bees. How can these two apparently opposite recommendations be harmonized, for fall feeding means producing bees that will become only consumers? I take it that the first advice is not to be taken in the full sense of the word. The raising of a moderate amount of brood during August can prove only beneficial, and in localities that do not furnish enough bee-pasture to produce this rearing of brood during August, daily feeding for a few weeks will undoubtedly be a good thing. In my own locality we have sufficient honey coming in all through August to keep the bees storing honey, and breeding. Even drones are usually reared. It is no particular advantage to have our colonies breed much later than Sept. 1, and I would just as soon discourage breeding after that time as to encourage it. Bees, I find, exhaust themselves while breeding; and as many bees die as come upon the stage of action during the cooler fall months. Our bees here generally remain quiet during the last half of September and all of October. They do not wear themselves out. Practically the bees hatching during September are as vigorous and well prepared to endure the hardships of winter as the October-

hatched bees produced by late stimulative feeding. By Oct. 5 our hives are usually free from brood, and any combs may be removed after this date. Generally speaking our bees come through the winter in good shape, which is the proof of the pudding.

We used to hear a great deal about reducing the numbers of combs to just what the bees can cover in the fall. Of late not so much has been said on this point. Has the bee-keeping fraternity come to the conclusion that it is not necessary or best? Whatever others may think of the matter, my own experience is this: A cluster of bees is admirably fitted to retain the warmth they produce. They are not covered with fur like some animals, yet very little warmth is lost. We can often see ice and frost within the closest proximity of the cluster of bees during cold weather. Even the best-packed chaff hive shows a low temperature inside after a protracted cold spell. A few more or less unoccupied combs do not change this result to any extent. I have a few exceptionally roomy chaff hives that take a number of combs *more* than the regular (ten-frame). I used to contract to six or seven combs; but for some years I have not done so; and, surprising as it may seem, they always have wintered a little better than the other ten-frame hives.

In wintering single-walled hives on the summer stand I have not been very successful, and have not practiced it much during the last 15 years; but I can say that I always had better success when three combs had been removed and chaff-packed dummies had been inserted instead. My practice is to winter colonies in single-walled hives in the cellar; and I am inclined to believe that for me it is best if part of the combs are taken out before the bees are taken to the winter repository. This is not so much on account or for the benefit of the bees, but more for the good of the combs. In one of my cellars the unoccupied combs become moldy. It is a rather damp place. We know from experience that honey does not keep very well in a damp place. Even in my comparatively dry house-cellar honey becomes thin after being stored there a short time. It is the same with the honey in the unoccupied combs of the hives in the cellar. One might say that such a winter repository is not a fit place for bees. Perhaps it isn't; but after many years of using these cellars I find they answer pretty well their purpose, and I shall probably continue using them. More combs shall be removed in the future from the hives that go into the damp cellar.

Not long ago a bee-keeping friend from Canada asked my advice as to what size of frame to adopt. It seems to me this subject of "what frame is best" has been worn threadbare; but then, as there are always new comers it is, perhaps, best to say a word now and then about it for the benefit of beginners. This friend in Canada has ten hives now, but thinks of increasing to

100 colonies. He had been advised by experienced friends in his vicinity to use a frame the Langstroth size, but about half an inch deeper, as this depth would give better results. Well, this made me think of the bitter battles they fought in Germany before the standard frame was adopted, some twenty years ago. The hives in use there ranged between nine and ten inches in width. Those defending the nine-inch hive claimed great superiority over the ten-inch hive. The nine-inch hive was better adapted to the nature of the bee; all colonies found in hollow trees were said to have chosen a nine-inch cavity. Many other claims were made. The defenders of the ten-inch hive brought forth equally weighty reasons that ten-inch was the proper and most profitable width. The casual observer thought they were splitting hairs, fighting over an unimportant matter. It is so, with such a slight difference in the depth of a Langstroth frame of standard width. So far as practical results are concerned *there is no difference* whether the frame is 9 inches deep or 9½ inches. In by far the most cases it will be found an advantage to use a standard frame, and that frame in America is the Langstroth as made by the different manufacturers in our land. Even our friend Doolittle, who so long defended the Gallup frame as the best, has come out late years and says the Langstroth is just as good for practical results. By all means adopt the standard frame. We who went into bees before we knew what was going on in our country, and made our own hives of an odd pattern, and now have hundreds of them, can see the size of our mistake, and would give a great deal to have a change made, if it were not connected with so much work, etc.

Naples, N. Y., Jan. 31.

THE BEE IN LAW.

Keeping of Bees; Damages—When and When Not Recoverable.—Article 6.

BY R. D. FISHER.

1. *Definition*.—Damages are the indemnity recoverable by a person who has sustained an injury, either in his person, property, or relative rights, through the act or default of another.

2. *General Principles*.—Whenever an injury is done to a right, actual perceptible damage is not indispensable as the foundation of an action; but it is sufficient to show the violation of the right, and the law will presume some damage.

But no damages are recoverable for a mere inconvenience attending the existence of a public benefit; or for any lawful act lawfully done, which, if causing damage, is *damnum absque injuria*; or for any act causing no legal injury, which is *injuria sine damno*; or for an injury caused wholly or in part by the complaining party's own wrongful act, default, or negligence.

3. *Nominal Damages*.—Proof of the violation of any legal right entitles the injured party to some damages. If no actual damages appear, nominal damages are given for the technical injury.

4. *Substantial Damages*.—Where actual injury and the violation of a right are proved, substantial damages may be awarded as compensation to the injured party, and in certain cases as punishment to the wrong-doer. In arriving at the proper amount of damages the courts follow defined rules.

5. *Remoteness*.—Immediate or consequential damages may be considered. No one is held responsible for all the consequences of his acts or defaults, but only for those which the law considers the natural consequences. These are either the direct consequences or they are indirect. For all direct consequences, whether they are such as inevitably ensue, or such as have naturally ensued in the particular case, the person guilty of the cause is held absolutely liable. Such damages as the cause produced naturally but indirectly are called consequential.

In case of *tort* not involving malice, damages may be recovered, not merely for the direct consequences, but for such indirect results as might reasonably be expected to ensue by a person of ordinary intelligence, or for all the natural consequences of the wrongful act.

6. *Personal Property; Trespass*.—For asportation or destruction of his personal property, so that the owner is wholly deprived of it, he is entitled to recover its value at the time of the trespass. This is the measure of damages for the entire loss of the property. For an injury to it there is a right to a proportionate recovery.

The measure of damages for the conversion of property is the value of the property at the time and place of conversion. The element of damage to be considered in case of injury to the person is, the plaintiff's time of loss from business or employment; his loss of capacity to perform the kind of labor for which he is fitted; expenses for medical services, nursing, and mental and physical pain. The same rule will apply to injuries to animals.

We have set out the above principles of damages for the purpose of discovering, if possible, under what branch or branches damages may be recovered for injury or losses in consequence of keeping bees. In a previous article we reviewed the causes of damages growing out of the nuisances committed by bees. In this article we desire to review the rules regarding the bee as a trespasser. One who feels aggrieved by reason of trespassing bees may bring an action against the owner for damages, and may recover upon proper proof and identification of the trespassers for their original act of destruction; and successive actions may be brought to recover for damages for the continuation of their wrongful trespassing; but in all these cases damages are es-

timated only to the date of the bringing of each suit (*101 N. Y., 98*).

CAPACITY TO TRESPASS.

Courts judicially know that bees can not be stabled as other animals are; that to do so would destroy their value as property. If the owners of houses, grocers, and fruit-dealers and fruit-raisers were not careless in leaving attractions for them, bees would commit no trespass. They would go to pasture among forests, fields, and amid flowers. But the grocers, fruit-dealers, and fruit-raisers say they are not required to screen against bees if domesticated and regarded as property; that the law should protect them from the ravages of trespassing bees the same as from any other trespassing animals. This is true only in so far as identification can be made positive. The instinct of bees is well understood, but their identification is difficult. The relation between fruit-growers and bee-keepers is said to be somewhat strained. The former claim it to be fair to compel the bee-keeper to feed his bees at home in seasons when they would otherwise prove a nuisance and damaging trespassers to his neighboring fruit-grower. Whether it would or would not be possible to keep bees at home by feeding them heavily is an open question. But this plan would entail a heavy tax upon the bee-keeper. Would it be just to make the bee-keeper pay this when, quite likely, the cracked and rotting fruit which the bee would take from the neighbor's orchard has been produced, at least has set, because of the labors in pollination of these same bees? When bees find a fair supply of nectar in the flowers within reach of the hive they prefer that to fruit, and few bees then attack fruit. But it is not at all sure that liberal feeding will keep all of the bees at home, or nearly all of them, from trying to get fruit sugar or juices.

The next suggestion is that of moving away if the cost would be less than feeding. But can the bee-keeper get away from the fruit-grower? If the extensive fruit-grower can sue and collect damages for injuries to the fruit on his 1000 trees, the owner of one tree, and 1000 owners of trees within flying distance of an apiary can also collect. If an abundant bee-pasture happens to exist a few miles away, the solution is easy and moving is practical. But this is usually of short duration; civilization and improvements, farms and fruit-gardens, soon follow, and the cry is again, "Move on!" On the other hand, it is claimed that the damages to fruit alleged to be due to bees is too remote and uncertain; and, as already stated, the benefits from pollination are equal to the damages. Few if any cases have reached the higher courts, and the judgments in the lower courts are largely based upon actual damages proved, and identification of the trespassing bees.

INJURY TO PERSON OR PROPERTY.

A small son of an Indiana farmer left the team he was driving, near some bee-hives,

while he chased a squirrel. The horses backed the wagon into the hives, and the animals were so badly stung that they died. The boy was also stung so badly that he lost the sight of one eye. It was held that the boy's contributing negligence occasioned the injury and resulting damages, and no recovery could be had.

An Iowa farmer maintained a hitching-rack at the roadside in front of his residence. Near by, but within his inclose, he kept a number of stands of bees. A neighbor voluntarily hitched his horses to the rack. A swarm of bees settled upon the animals, causing them to break the tethers and run away. In their flight they collided with a team and vehicle going in an opposite direction, and both teams and vehicles were damaged. It was held that the hitching of the horses near the bees was a voluntary act, and the attack by the bees was too remote to justify a recovery from the bee-keeper for the joint damages suffered by the owners of the wrecked outfits.

In the case of *Earl vs. Van Alstine* (8 *Barbour, 630*), the New York Supreme Court held that the owner of bees is not liable, at all events, for any accidental injury they may do; that one who owns or keeps an animal of any kind becomes liable for any injury the animal may do, only on the ground of some actual or presumed negligence on his part. It was alleged in this case that defendant owned and wrongfully kept fifteen hives of bees in his yard adjoining the public highway, and that the plaintiff's horses, while traveling along the public highway, and passing the place where the bees were kept, were attacked and stung so severely that one died and the other was greatly injured. A judgment of \$71 was appealed from, and the court, in reversing this judgment, said: "In an action against the owner of bees for an injury done by them to the plaintiff's horses while traveling along the highway where the bees were kept, it appears that the bees had been kept in the same situation for nine years, and there was no proof of any injury ever having been done by them, but, on the contrary, neighbors testified that they had been in the habit of passing and repassing the place frequently, without having been molested. This rebutted the idea of any notice to the bee-keeper, either from the nature of the bees or otherwise, that it would be dangerous to keep them in that situation, and hence he could not be made liable."

If damages be done by any domestic animal kept for use or convenience, the owner is not liable to an action, without notice (13 *John, Rep., 339*). The utility of the bees no one will question, and hence there is nothing to call for the application of very stringent rules in their case. However, the question whether or not the keeping of bees near a highway subjects their owner to a responsibility which would not otherwise rest upon him has not, to our knowledge, been passed upon.

RAMBLE 201.

Honey Yield of Cuba; Cuban Honey-packages; Extracting; Hive-bottoms; Blacks Preferred in Cuba; Help, Price of.

BY RAMBLER.

So far as I can learn, no one has kept a record of the colony yield for one or more seasons in Cuba. I think it is not nearly as much as in California. For instance, Mr. Wilder, of California, secured an average of 240 lbs. per colony from an apiary of 100 colonies during the past year; and in the last GLEANINGS Mr. Raze reports a yield of 380 lbs. average from 50 colonies. I know of one bee-keeper here who has had an exceptionally good yield (so considered by his neighboring bee-keepers). Though the season is not quite closed he can reasonably forecast the result, and his average yield will not go above 160 lbs. per colony, 600 in two apiaries.

Cuban honey is all put into barrels and tierces, mostly in the latter, holding 100 gallons, and called bocoyes. The barrel, or tierce, is gauged by the dealer, and it goes by the gallon, the dealer paying for the tierce. Price of 50-gallon barrel, \$3.00; bocoy, \$6.00, or at the rate of 6 cts. per gal-

lon. This helps the bee-keeper out a little better than the practice in the States, where the price of the package is lost to the producer. It is a rank injustice, and the Cuban plan should be adopted.

Mr. Somerford uses the ten-frame L. hive, and works exclusively for extracted honey. I find the majority of bee-keepers here run their honey directly from the extractor to the barrel, not taking much care about bits of comb and bees that may get in.

This plan is adopted at Mr. S.'s home apiary. When I first entered his extracting-cabin his men were at work slinging honey. The extractor is securely anchored to a stone and cement foundation. There is drop enough for a futile strainer (futile means one that will take out the largest bits of comb, etc.), and below this the barrel. I told Mr. S. that his house looked like a cider-mill. You see that big barrel was suggestive. It smelled like a cider-mill, and, to all intents and purposes, was no better than one.

But I can make a better report about an out-apiary a few kilometers further along on the calzada. Here he had gotten down to business, and made an 800-gallon galvanized-iron tank, held to shape by a wooden frame; another, of about the same size, is doing duty in another out-apiary. One novel feature of these large tanks is the absence of a gate or faucet for drawing off the honey. Gates sometimes have a way of getting open and losing a large amount of honey. Mr. S. places the barrel or bocoy next the tank, and uses an ordinary pump for transferring the honey. The honey can be left a long time in the tank, for, like California sage honey, it does not granulate. Or if any Cuban honey does granulate it has a mushy consistency.

SOMERFORD'S 800-GALLON TANK.

I noted another peculiarity about this honey. In my experience in extracting in the States, while using the honey-knife its edge will soon gum with honey. I have always used two knives, alternating them from a water-bath; and many bee-keepers use a hot-water bath to dissolve that gummy edge. But here one knife can be used all day and no gumming. There is an acidity, or perhaps it is so limpid, that the knife always cuts freely.

The uncapping-tank is just like all of Mr. S.'s ideas—immense—6 feet one way, 5 the other, and one foot deep. He says the next one will be several feet deep. He does not want his lightning operators to stop to bother with the cappings during the extracting of a whole apiary.

The accompanying photos show two views of the same apiary. The honey-house is built against the ruins of an old stone house, and these ruins are frequent all over the country, as a result of the war. Beside the house are the barrels, the big tank, and the cart for the transfer of a large number of combs from hive to extractor.

In the other view, and near Mr. S., is one of those cement hive-bottoms described in GLEANINGS some time ago. Mr. S. found these too fragile, and has discarded them. His hives are now provided with a continuous bottom. A bed of small stones is put down where he wants the hives to stand; the surface is then made smooth with cement. Before the hives are placed it looks like a long sidewalk.

In every apiary I have visited in Cuba the hives are placed close together, or from four to six inches apart—just barely room

to step between. I strongly doubt if Mr. Somerford can get his big feet between some of his hives.

I note here the absence of the sun wax-extractor. In the summer months, when there is sun and heat enough, there is not much wax to render. In the winter, when the honey is taken, and there is wax to render, there is not heat of sun enough to have much effect, and so the old kettle and boiling method is resorted to.

Home-made foundation is used, and beesmen are liberal in the use of it; but after all of this liberal use there is an immense amount of wax shipped from Cuba.

Mr. Somerford does not take time to render his cappings as fast as taken; but after allowing them to drain thoroughly he packs them in barrels which have been sawn asunder. Cappings from the work of many days can be stamped by foot pressure into small space, and Mr. S. avers that the polka step is the most effective. The reader can gather from the illustration just how he does it.

Bro. Somerford really believes that the black bee is better than the Italian, for Cuba. It is not on account of lack of energy on the part of the Italian, but from too much of that quality. The extra energy of the Italian leads to the filling of the brood-chamber with honey, and crowding the queen down to a little patch of brood. In due time the colony becomes so reduced in working force as to become a non-producer. On the other hand, the black bee does not so energetically fill the brood-chamber, and the strength of the colony is continued through the entire honey season.

SOMERFORD'S CEMENT HIVE-BOTTOMS.

The only remedy is to extract often from the brood-chamber, which bee-men general-

to-date information, and all the time absorbing more from our abundant literature.

All the same, if they come to Cuba they must come in competition with the cheap labor.

THE POLKA STEP.

ly do here, and from both blacks and Italians.

From my limited observation I think close attention is not given to thorough re-queening; and I am sure that a less number of colonies could be managed with more profit than so many.

In the managing of a large number of apiaries the question of help plays an important part. I don't believe the native Cuban, on the average, is so efficient as the average American. But as they can be hired for about \$15 per month they will probably be preferred to the higher-priced bee-men from the States. But very few of these Cubans can read or write. Three-fourths of the people of Cuba are illiterate. To allow you to judge of the illiteracy of the rural population, I would say that I received my mail for a few weeks at a town of some 1500 population. When I would call for my mail the postmaster would take down a common cigar-box and pick out my letters and papers. All the mail for said town was in that box!

While there are a great many bright young Cubans, the rule is the other way. It will be hard to make me believe that they can so intelligently manage an apiary as a bright young man from the States, with up-

BEES AND PEACHES.

Mrs. Axtell tells us some of their Experience Last Season.

BY MRS. L. C. AXTELL.

Mr. Root:—Our bees have done us no good for several years, and do not promise to be worth caring for for the coming year, as the white clover was so dried out, and all other honey-bearing plants last year; and it is dry this winter and spring, and bees injure peaches so badly I would about as soon they would die out. I observed very carefully last fall the peach-orchard, and decided that, although the bees did not make the first incisions, they soon followed and ate up the peach, which, if they had left alone, would have been marketable in our home market. The first puncturing came from birds—sometimes only a bite or two in the finest peaches, and then they would go to another peach and take a bite, and so on until they had bitten a dozen or more on a tree; and if those peaches could have been picked right away, this would not hurt their sale very much in our home market; but if left a few hours the bees sucked out great holes in them, so they would not sell. The peach juice is also bad for bees. I suppose the birds picked into the ripe peaches because green ones could not be so easily punctured. We could see the birds pick them.

Roseville, Ill., Apr. 7.

[Mrs. A., I thank you for this testimony, and I think it is correct. Bees are certainly in one sense a nuisance many times to the peach-grower. But where peaches are to be shipped away, in modern peach-growing, the pickers are on hand and gather these peaches you mention before they get so soft that the birds are inclined to puncture them. Of course, the birds, unless frightened away, will get their work in to some extent; but these peaches can, with proper care, be utilized for the home markets, or by canning or drying. I watched this whole thing pretty well last season in the great peach-orchards in Northern Michigan. Friend Hilbert does quite a canning business in connection with shipping peaches. The peaches are canned in half-gallon jars, and put up by the hundreds if not by the thousands, and they have no trouble in selling all they can put up, in Traverse City. I believe the jars are sometimes returned; but, even if they are not, good jars are as good as cash. Mrs. Root dried a few of those overripe peaches. For my part, I like the dried peaches best.

They agree with my digestion better than the canned peaches. Now, the great moral here is: To take care of the peaches and all other kinds of fruit before the birds and bees can get a going; and I think it will pay well to do it, even in seasons when the bees do not go near the peaches at all; and I suppose all will admit we have many such seasons.—A. I. R.]

Here is something further from one who has had ample experience with both bees and peaches. He writes:

I have recently bought a whole apiary for the purpose of being certain that all of my peach-trees would get properly pollenized, as I have about 4500.

Amity, N. Y., Mar. 31. HARRY VAIL.

W. C. R., Ohio.—We would not advise you to set a bucket of syrup out in the open air, as it would result in fearful robbing, and many of the bees would be drowned. To feed syrup, it should be put inside of the hive.

J. H. G., Mich.—It is possible to feed bees in the cellar, but it is usually not advisable, as it stirs the bees up to too great activity. You may, however, feed cakes of hard candy made of pure granulated sugar without any coloring or flavor.

W. M. H., Wis.—There is no practical way of preserving queens for any length of time except in little nuclei. A dozen queens, or even more, can be kept in mailing-cages under a quilt of a strong colony for two or three weeks, and possibly a month; but the Good candy should be renewed at least every ten days, all dead bees shaken out, and fresh ones put in their places.

J. S., N. Y.—There is no objection to leaving the two extra frames of honey in the brood-nest if you have them; but if the other six combs were well filled with honey, and the bees could be accommodated on the six, I would take out the two combs not needed, even if they were filled with honey, set them aside, and then in the spring give them to the colony that might be running short of stores, whether it be the one under consideration or some other one. In any case, when the frame contains brood it should be left in the hive till the brood hatches.

B. K. W., Neb.—It is not advisable³ to use old sections that are soiled from the season before. While honey can be stored in them, yet, no matter how good the filling and how nice the honey, they are pretty sure to go at second-quality grading. This would make a difference of anywhere from two to three cents a pound; and to use brand-new sections in place of old ones, would entail a cost of less than a third of a cent.

E. H. K., Ill.—Replying to your question of March 26, I would state that you need have no fears that any one who is a neighbor of yours can, by any means known, induce his bees to go and rob yours. If your colonies are weak with large entrances, and his are strong, there is a possibility that his bees might rob yours; but if you will reduce the entrances down to the size that the bees can properly defend, you need have no fear of your neighbors' bees.

F. W. C., La.—Galvanized iron is suitable for honey-utensils where the capacity is a barrel or more; but I would not advise its use in smaller cans. In California this metal is used entirely for storage-tanks; but they hold a good many tons, and there is comparatively very little of the tank that comes in contact with the honey. Small galvanized utensils would do for a short time, but we would not advise keeping the honey in them for any great length of time. The galvanized metal is perfectly safe for extractors in any case, because the honey remains in them so short a time. Its use in this country for this purpose is now universal.

A PARTIAL VIEW OF ONE END OF OUR MACHINE SHOP BEE-CELLAR. SEE EDITORIALS.

NOISE IN BEE-CELLARS; DOES IT DISTURB BEES?

Mr. Root:—I have read with much interest this past winter the good reports you have put in GLEANINGS about those bees which were wintering under the machine-shop. I have also kept track of the reports of the Bingham cellar with its mighty ventilator. Now comes to hand the April 1st number of GLEANINGS, and states that noise does not disturb bees, and that ventilation, and lots of it, keeps the bees quiet. I can swallow quite a big piece, but the above is quite unreasonable. My thought was that Mr. Root had made a slight mistake, or was placing too much confidence in his new hobby of wintering bees under a machine-shop. In looking up the meaning of "noise" I found the definition to be, "a loud sound; outcry." I went into my bee-cellar, which has over 70 colonies in it, the hives standing on benches with neither bench nor hive touching wall or ceiling, and the bees in that peaceful mood which denotes successful wintering. I stepped two paces into the cellar, and shouted "Hello!" The bees answered with a "buzz, buzz." I could hardly believe myself; and, thinking that Mr. Root and GLEANINGS might still be right, I shouted again. This time the bees went "buzz, buzz, buzz" again, and there was a general stir among them. So I went out and shut the door, proving to my own satisfaction, as Mr. Root says, that noise does disturb bees.

Mr. Root might say the foregoing was not a right test, so here is another:

Over my bee-cellar is a work-shop, and on stormy days during winter I was nailing frames, fastening the end-bars with $1\frac{1}{2}$ -inch nails. The shop was empty; and by nailing the frames it made quite a noise. The thought came to me one day while nailing, "Does this noise disturb the bees?" The next morning, before I started to work, I put my ear to the cellar-door. Every thing was quiet, so I went to work. After nailing for about half an hour I went to the door and listened again, and found that the bees were on a general rumble. If noise does not disturb bees, what was it that caused them to roar as they did, and then quiet down as soon as I quit pounding?

As for ventilation, I have found out the past winter that bees can be wintered satisfactorily without it. F. O. R. SIMPSON.

Newmarket, Ont., Apr. 14.

[I judge from what you say you have not read all I said on this subject of noise in bee-cellars. I am quite ready to concede all you say so far as your own experiments with your own bees are concerned, yet if you were to come here to Medina I could convince you that what I said was literally

true. Going into the cellar and shouting, as you did, when quiet had reigned supreme for weeks before, was a sudden shock, and it would disturb any bees; but if you were to go into that cellar every day in the week, and shout for ten hours, you would find the bees would get used to it. Our machine-shop is run from ten to eleven hours a day, six days in the week, and the noise is *constant* with the rumble of machines and occasional droppings of heavy castings. Bees get used to such noises that are incessant, just as we get accustomed to trains going by our windows every hour in the night without waking us from sleep. The first night or so it is distracting; but it does not take long to get used to it, just as the bees get used to the noise above in the machine-shop or living-rooms over ordinary house cellars.—ED.]

HIVING SWARMS.

Which is the best method of hiving a swarm of bees—by trapping the drones and queen in a drone and queen trap, when the swarm goes out, or letting the queen go with the swarm and trying to get the bees into a hive afterward? J. C. WHITE.

Solon, Mich., Apr. 7.

[For the average beginner it would be better to use a drone-trap. I would not advise letting the queen go with the swarm, because it entails a risk of losing the bees, and at the same time causes a great deal of inconvenience and a waste of time. It is a common practice of our best honey-producers to clip one wing of all queens. When a swarm issues, the clipped queen can be picked up at the entrance, as a rule, put into a cage, and held up on a swarming-pole, where the bees will very soon cluster, or put into a hive of combs on the old stand. Wing-clipping has the advantage over perforated zinc in that it saves some expense, and does not obstruct the entrance as does the metal.—ED.]

PLANTING FOREST-TREES, ESPECIALLY BLACKWALNUT.

About twelve years ago I bought a farm in Isle of Wight Co., Va., on which there was a field of about 15 acres of rather poor worn-out soil. Ten years ago I had blackwalnuts planted on it in rows 24 feet apart each way. The field held 1200 hills. The next spring they came up in a nearly perfect stand. I gave a man the use of the land to take care of and replant, where the trees did not come up. He, in common with all his neighbors, thought I was "loony," and for several years he paid no attention to replanting, and very little to taking care of what he did not plow up or otherwise kill. So for the last two years I have replanted and trimmed them myself, and that was what I was doing last week. There are now between 500 and 600 good trees. In 1900 the first tree bore nuts, and last year about 24 of them had nuts on. This

year, if all goes well, fully 200 should bear. A very few of those trees are 25 feet high and 8 inches through at the butt, while 200 or more of them are over 20 feet high and 5 inches or more in diameter six inches above the ground; and since the nuts are worth \$2.25 per barrel, and blackwalnut lumber is worth \$100 per 1000 feet, the man who failed to care properly for the trees, and his neighbors also, admit that there is some method in my lunacy after all, although my tenant does not see why I should "fault" him for being careless about the trees, "Kase them trees is gwine to be wuth a heap course o' ten or fifteen years;" and he "lowed ef they'd a been on his lan' he'd a plowed every dratted one on em up the fust ear;" and he really thinks I should be well pleased at what he has done, in spite of the fact that, had he lived up to his agreement, I should now have had twice as many trees well on the way to a bearing size and age. This year I planted 400 paper-shell pecans and 190 Japan walnuts.

J. W. STEBBINS.

Broadcreek, Va., Feb. 5.

[I have given the above mainly to show how easy it is to grow a grove of walnuts, especially since the lumber is getting to be away up in price; and with the nut-bearing trees we can, as you notice in the above, be getting some revenue while the trees are getting to be of suitable size for lumber. Our baswood-orchard has many trees now over a foot through; and the yield of the honey from the grove is on the increase year by year.—A. I. R.]

THE NATURE AND GENERAL CHARACTER OF PICKLED BROOD.

1. Has pickled brood absolutely no perceptible odor?

2. Will there be absolutely no ropy matter adhere to a toothpick when withdrawn from a dead larva having had the disease known as pickled brood?

3. Will a comb that has been rotten with foul brood during June become filled with healthy larvæ afterward? Or, will a foul-brood cell produce healthy larvæ at times and diseased ones at other times?

R. C. HUGENTOBLE.

Miami, O., Apr. 12.

[1. Pickled brood has no odor like foul brood, nor has it a foul smell—in fact, no smell at all, as a general thing. If any odor is present at all it is slightly acid, or sour, and hence the name, pickled brood. In the advanced stages there will be a white mold over the surface of the comb; and this, in fact, is the best evidence that it is pickled brood.

2. Pickled brood is slightly ropy at times, but it never draws or ropes out more than an eighth of an inch, and, unlike foul brood, does not have a stringy character.

3. Cells that have contained foul brood may be cleaned out by the bees, and afterward healthy brood be reared in them; but

the probabilities are that those same cells containing the spores of the disease will again give the disease to other healthy larvæ. Yes, cells that have been foul-broody at one time may be apparently healthy at another.—Ed.]

GUESSING AT THE AMOUNT OF STORES IN HIVES.

Will you kindly explain in your next issue one or more methods by means of which the amount of honey in a hive can be determined without weighing each comb?

JOHN C. MCCORMICK.

Detroit, Mich., Apr. 12.

[The best way is to hang the hive on a spring balance, and thus get at the actual weight. If you know what similar hives with empty combs will weigh, and then add about 3 lbs. for the bees, you can determine pretty accurately the amount of honey in the hive. After weighing 50 or 100 hives you will then be able thus to determine near enough for all practical purposes by "hefting" or lifting the hives. Practice makes perfect, or nearly so.—Ed.]

CANDIED COMB HONEY—WHAT TO DO WITH IT.

I had a case of fine-looking honey of my last year's crop turn to sugar. Can you tell me the cause of it? and can you give me a way to prevent it? If you can, I will consider it a great favor. H. R. LONG.

Columbus, O., Mar. 29.

[You can give it to the bees or sell it to some of your local customers at a low price. I say *local* customers, because you can then explain that it is pure comb honey, granulated in the combs. Some take such honey and put it into a solar wax-extractor. The honey will melt with the wax, and run down into the pan. The wax will be on top and the honey beneath; but the color of the latter, when so treated, is affected for the worse, and is usually fit only to be fed to the bees. The cause of the granulation of the honey may be due to the fact that you kept it in a cool place over winter. But some honeys, especially some seasons, will candy, even when the conditions are favorable for keeping it liquid.—Ed.]

THE CALIFORNIA HONEY CROP.

Friend Root:—On page 227, Mar. 15, I notice an editorial and quotations from letters concerning the honey crop in California. It makes me laugh—or it would if it were not so provoking. What fools some of our California bee-keepers are! Eastern honey-producers need not worry much about the big crop in California this year, for we shall not have it unless we get two or three inches of rain yet, and then the weather will have to be just right for about three months yet. I have been in the bee business here for 19 years, with more or less success; and if we have much of a crop

this year there is something wrong with my judgment. There will be some honey in a few favored locations, but no general crop in the southern part of the State.

Of course, we can not tell what the bees will do in the central part of the State on the alfalfa. We seldom get a crop of honey here with less than 14 to 18 inches of rain. Last year was an exception. We don't often get exceptions two years in succession, but we often get two failures, and sometimes three, in succession.

This year we have had nearly as much rain as we did last year—about 12 inches; but nearly a third of it came early last fall, when it did the bee business more harm than good, as it started the sages and alfileria to growing nicely, and then the long dry spell, which lasted until February, dwarfed or stunted the alfileria so that it is not a fourth as good as it was last year; and the sage will not bloom as it did last year, or as it would if all our rains had come after the holidays. L. E. MERCER.

Ventura, Cal., Mar. 29.

BEEES IN A DEEP MOUNTAIN CANYON.

I should like to ask if bees will do as well down in a canyon where they do not get the sun until about 7 A. M., and where it leaves them about 5 P. M., as they would up where they would get more sunshine.

Mesa, Col., Apr. 9. W. C. DOBBINS.

[You probably could not produce as nice an article of comb honey down deep in a canyon as you could where the sun strikes earlier and later in the day; but I ran across fine large apiaries in California in several of the canyons, and the honey I tasted at all of them was of a heavy body and of fine flavor, notwithstanding the nights in those same canyons were quite cool. Indeed, it was very comfortable to wrap in a good heavy blanket at night in a warm house. If I knew of a good location in a canyon I certainly would locate the bees there.—Ed.]

FIGWORT, OR SIMPSON HONEY-PLANT.

If it hadn't been for the Simpson honey-plant our bees would have gone to begging into winter; but the late bloom of this plant just put them in fine condition after the dry season. This plant grows plentifully in old fence-rows, brush-piles, gulleys, and waste places. It likes a good rich sandy leaf mold, but it seems to use almost any kind, so it gets a start, and it is easy to grow from seed plants this fall or early spring. A great many will bloom the first season. J. C. DEEM.

Knightstown, Ind.

CHINESE BEES THE FORERUNNERS OF GOOD LUCK.

In a recent number of GLEANINGS I saw the statement that the bee has never been tamed; but if left to itself will always seek a home in the woods. This is emphatical-

ly *not* true of Chinese bees. *They seem always to seek a home with man*, somewhere in some sort of structure reared by his hand; and the only case that I have yet met with in all my tours of a swarm of bees in a hollow tree was in the edge of a village, in the butt of a large camphor-tree, about six feet from the ground. For ages and ages the Chinese have believed that bees bring good luck; and so for ages and ages the safest place for bees has been the human habitation, till now they cleave to man instinctively. Even superstition sometimes shows a brighter side. But may not a few generations of scientific bee culture accomplish the same results in America?

J. E. WALKER.

Shaowu, Foochow, China, Feb. 11.

SWEET CLOVER—ITS HABIT OF GROWING ON SOILS SO POOR THAT NO OTHER PLANT KNOWN WOULD TAKE ROOT AND FLOURISH.

Several years ago the B. & O. R. R. opened a gravel-pit at Belpre, O., for ballasting the track and constructing fills. Sweet clover first made its appearance in this region, so far as my observation goes, on the fill forming the approach to the Parkersburg bridge. This fill was made of gravel taken from the Belpre gravel-pit.

Last week as I passed by this pit, now thirty feet deep, I noticed sweet clover growing as thick as it could stand in the bottom. This gravel deposit is of combined glacial and alluvial origin with an occasional true boulder, brought down by the river from the glaciated part of the State. Was the seed deposited with the gravel? Dana, in his geology, speaks of plants growing from sand taken from the bottom of a well dug a few miles from the seacoast. There were no plants of the variety growing near the well, but they were found growing on the seashore. No doubt the well had tapped soil which at one time had formed the sea-beach.

[The above was sent us in the shape of a newspaper clipping, so we can not tell what paper it was taken from. It emphasizes the fact made by Prof. Thorne, of our experiment station, that sweet clover, as a rule, occupies ground where no other plant would grow; but after the sweet clover has got a start, and has been plowed under, various farm crops may be grown successfully.—Ed.]

GOOD WINTERING ON BLACK HONEY-DEW.

I have 40 colonies of bees in the cellar, wintering well so far on the blackest honey-dew you ever saw, and have 400 lbs. of the same for spring feeding. I got but little good honey last year—too dry.

A. G. MOORHEAD.

Dearborn, Mo., Feb. 22.

BEEES AND SMELTING-FURNACES.

My husband's bees are all dead (killed through the smelter smoke), and the same fate befell all bees in this county.

ALICE M. BANGERTER.

Granger, Utah, Mar. 8.

My wife is much interested in bee culture. One swarm produced 110 lbs. of honey last year—that is, surplus, besides over 50 lbs. left in the hive for the bees.

Wanatah, Ind.

S. P. HOWELL.

AMATEUR BEE-KEEPING; POSSIBLE RESULTS:
SLIPSHOD VS. UP-TO-DATE METHODS.

I like your manner of writing, of crediting young or amateur bee-keepers. The boy bee-keeper of Arizona whom you tell of is evidently progressive and up to date. I have heard men here in California boast of their thirty years' experience in bee-keeping, yet they were not able to afford a decent habitation or a bed for their weary bones, and no family to educate or support. It certainly does not speak well of any man, with no one to care for but himself, not to be able to have half a comfortable living off from a large number of bees, and thirty years' experience. Give me a wide-awake, progressive person, such as you describe Mr. Chambers to be. I too am an amateur, with only two years' experience. I am on the shady side of fifty, and have poor health to contend with; yet with little assistance last season I managed an apiary of nearly 300 colonies of bees that produced 16,000 sections of comb honey of the finest quality. Every one of the sections passed through my hands four times, and many of them six times. I folded all the sections, placed all the starters of foundation in them, graded and cased all the honey, marketed it, and collected for it; besides, I attended to many of the swarms, gathering and hiving them, placing supers on and taking them off the hives. In addition to this I did the necessary housework, cooking, etc., for two persons; contributed to several periodicals, and found time to become acquainted with the little creatures that made our living and much money for us. Under my instructions queens have been reared all winter, weak colonies built up, and we commence the season with every colony very strong; and at this writing the bees are working lively on the alfalfa. I procured my best queens of J. P. Moore.

Newhall, Cal., March 13. J. B. C.

GOVERNMENT STATISTICS; EARLY CUTTING
OF ALFALFA.

Mr. Root:—It might be an imposition on you to call for more space to discuss the honey statistical problem; but I hope you have time to read a little more on the subject. That our present guesswork belongs to some past century is quite certain. The remedy is debatable.

On p. 228 Mr. M. Brown advocates that the National Association collect and report information on the subject. While that would be an improvement, I do not think it would be as good as for the Department of Agriculture to do the work. Some reasons are:

1. The Association can not expect to get as many localities reported in many years as the Department can in one. Think of over 200,000 correspondents who are filling township blanks. These are not all honey townships, but many of them are. Perhaps no correspondent produces every thing re-

ported—certainly few do; but I think it is the most reliable plan yet devised. Mr. B. says: "Suppose the Department would add a honey column to its blanks now sent out, not one in 500 sent out would be filled out practically, intelligently, and with reliability." Would not that sentence be better if it closed with the largest interrogation-point in your office?

Why, yes, the thing is fact.
Though, in regard to numbers, not exact.

Honey-producers should fill out these reports as much as possible, or inform those who do. But remember that they are not all intelligent and reliable.

2. It is to our interest, and for the public good, that these reports be accepted by all classes. That would never be done so completely if the Association gives the reports as if done by the Department. Official information is the thing that counts in this age of the world.

3. The cost would be considerable if conducted by the Association. Our industry is to be taken up in connection with various other lines, and the cost to the government would be light. As it is for the public good it should be done at public expense. Why does the wheat-raiser turn over his crop report to the Department, instead of conducting it as a private enterprise? Every honey-producer should learn why, and then drop in line?

To my mind there is nothing that would do so much to put the honey market in a healthy condition as reliable statistics well distributed and generally accepted.

You are entirely correct about the early cutting of alfalfa. Many bees have recently been moved from this valley to Nevada, mainly because alfalfa is not cut so young there, although the parties are going into foul-broody country, and expect loss from that source.

W. A. H. GILSTRAP.

Grayson, Cal., March 29.

[The only question about government statistics is that they are put out too late to have any appreciable effect on the market; but whatever the government does it should have the intelligent co-operation of bee-keepers as a whole. The whole trouble so far with government statistics is not so much that the method of securing those statistics is defective as it is that some States make thorough reports while others do not. Again, it happens that the statistician or person whose business it is to gather the statistics does not get track of all the small producers. See editorials.]

So it is a fact, is it, that, on account of the early cutting of alfalfa, bee-keepers are already being compelled to migrate from localities where alfalfa is not cut before blooming? My, oh my! if it is true that early-cut alfalfa makes a better hay, or, in other words, puts more money into the pocket of the rancher, then the carloads of alfalfa honey now produced will shrink into mere tons in the future.—Ed.]

EXTRACTING A WHOLE SUPERFUL OF COMBS AT ONCE; ANOTHER PLAN FOR DOING IT.

I can tell you how to overcome the difficulty in extracting an entire shallow extracting-super at one operation, or, rather, two or four of them, as spoken of in your footnote to the article by J. Hammond, page 244.

We will have our combs built on thin boards, deep cells, as has been done in Germany (so says Prof. Cook's Manual). There will then be but half the amount of uncapping necessary, which cuts that difficulty squarely in two. Put four such supers in the mammoth extractor; no tin separators are necessary; the wood cell-base answers for that. No reversing is necessary, as the cells are all on one side; the honey rains out on to the wood cell-base; then turn the supers half way around, and all the honey will be thrown from the wood partition. I quote from Cook's Manual: "In Germany it is recommended to press the foundation for extracting-frames on to a board so as to have the cells built out only on one side, and elongated so as to hold much honey. This gives strong combs, and saves turning the frames when extracting."

Seriously, what do you think of this? With such combs would it not be practicable to extract four shallow supers at one operation? Tell Rambler to send on his \$50, for I have told him how (perhaps).

E. F. ATWATER.

Boise, Ida., Apr. 7.

[The one-sided board combs have never been a practical success, if I am correct. I doubt whether bees would store honey in them as readily, because each comb would be shut off from its neighbor by a wooden partition or separator, making separate and distinct clusters. This has been one objection to solid separators in an ordinary comb-honey super. Again, these single-surface combs would have very deep cells—probably twice as deep as those of ordinary combs. If so, the honey would hardly ripen as well.

If there are any of our readers who can give us any information regarding these one-sided extracting-combs we should be glad to hear from them.—Ed.]

WINTER STORES; AMOUNT CONSUMED OUTDOORS AND INDOORS; A REPLY TO DOOLITTLE.

After the bees in October have carried the loose honey to the top of these hives I have two men weigh and mark the weight on all hives. I then add to or take from all hives till each one has from 30 to 35 pounds (net) of honey for winter. I have done this way for years, and find very little difference in the amount consumed whether packed on summer stands or in cellar. No man that I have ever heard of ever put 100 colonies in the cellar or out for a five-months' stay, on one ton of honey.

The temperature of the earth below the frost-line is between 32 and 34, yet Mr.

Doolittle has no trouble in keeping his bees at about 50. How is that 10 to 20 degrees of heat obtained? I need not say by the consumption of honey—every one knows that.

My estimate is correct. From one-fifth to one-fourth of all the honey eaten in winter by bees is water. Other conditions being equal, no water above that is needed. Where does the water that runs down Mr. Doolittle's stone walls come from? We may yet find that the dry heat of a steam-engine is what we all need to winter our bees in the most economical manner.

Farwell, Mich.

T. F. BINGHAM.

[It has been set down as a rule that the consumption of stores indoors during winter was very much less than outdoors. Our own experience during the past winter showed us that our cellar-wintered bees consumed very much less than the outdoor bees—so much less that we are beginning to feel that we can not afford to winter outdoors, especially some seasons when we have to buy sugar and feed syrup when we run 500 colonies and nuclei in one place.

There have been actual weighings of the amount of stores consumed during those months of confinement in the cellar, that showed an actual shrinkage of from 5 to 12 lbs., the average being somewhere between 10 and 11 lbs.; and there have been actual figures to show that the actual consumption outdoors, by colonies of the same relative strength, was about twice as much. See GLEANINGS, page 102, 1901.

One of the main arguments for indoor wintering has been a saving in stores. Now, if stores are consumed *in proportion* to the amount of cold, and the temperature of a bee-cellar is from 40 to 50, and the temperature outdoors is anywhere from 10 above to 20 below zero, then it would seem to me there must *necessarily* be a larger shrinkage of stores outdoors.—Ed.]

THE OPINION OF AN EXTENSIVE FRUIT-GROWER ON THE VALUE OF BEES AS POLLINATORS.

I had hoped to handle honey as well as fruit; but I am kept so busy running my fruit-farm (7000 grapevines and 2000 fruit-trees) that I simply have not time to give to bees. In a year or so, after I train my help on my fruit-farm, I may conclude to try the bees. Meanwhile my neighbor's 40 hives of bees, and the wild insects, seem sufficient to cross-fertilize my fruit. In my business I consider honey-bees a great aid to me, not only in fertilizing the flowers, but after hornets puncture a grape the bee kindly sucks out the juice, which prevents that one berry from spoiling several more.

W. T. LINDSEY.

Tryon, N. C., April 17, 1902.

[Among the intelligent progressive fruit-growers, those who are above prejudice, the bees are always considered to be friends.—Ed.]

Blessed are the pure in heart, for they shall see God.
—MATT. 5:8.

While I write, April 17, we are busy with the seed business. In fact, we are almost always busy at this season of the year; and we are trying hard to profit by experience in preventing the mistakes, misunderstandings, and oversights of the past years, by doing better this year than we ever did before in serving our customers promptly and honestly. Well, day before yesterday a letter was put in the tray from one of the friends, asking what we meant by charging him 75 cents for an ounce of Red Wethersfield onion seed. I went at once to the copy-book, and there it was in plain white and black—"One ounce onion seed, 75 cents." I asked the clerks who put it up how they came to send him an ounce, and charge him the price of 16 ounces. Before they would admit they had sent only an ounce they wanted to see the order. This was hunted up, and here is a portion of it:

Cissna Park, Ill., Apr. 3, 1902.

1 oz. Grand Rapids lettuce.....	5
1 oz. Rocky Ford canteloupe muskmelon.....	5
1 oz. Landieth's Boss watermelon.....	5
1 oz. Prizetaker onion.....	20
1 oz. Red Wethersfield onion.....	75
1 oz. radish, Wood's Early Frame.....	5
1 oz. Trophy tomato.....	10
1 oz. salsify.....	10
1 potato-planter.....	75

DR. C. S. DIETZ.

You will see by the above that our good friend Dietz made the mistake himself. He had been writing "1 oz." so many times that, when he got down to where he meant to say a *pound*, although he carried out the *price* for a pound, he continued writing "1 oz."

Now, some people (perhaps some *seedsmen*) would say it was the man's own fault, and would send him exactly what he ordered, and charge him exactly the price he put in the order. Of course, any reliable seedsmen would rectify the mistake by sending him the other 15 ounces of onion seed; but perhaps not *every* seedsmen would pay the postage (the whole order went by express), because these 15 ounces did not get in the package. I suppose, however, the greater part of the up-to-date seedsmen would say at once it was the business of the seedsmen to examine and scrutinize very carefully every item of the order to see that the man was ordering by the advertised catalog prices, charging him no more or less, even if he did send 75 cents for 8 cents' worth of onion seed. In fact, we do have just that arrangement here in our seed department. Our young friend Frank, who almost never makes a mistake, did go over this order and correct the prices. For instance, in the last item he put the potato-planter at 60 cents, instead of 75, the last

year's price. But for some inexplicable reason he did not notice that our friend was charged 75 cents for an ounce of common onion seed. The clerk after him did not notice it; and I suppose the typewriter clerk who makes the invoice did not consider it any of her business to notice whether onion seeds were worth 10 cents an ounce or \$10. We sent the man a humble apology, and paid the postage on the 15 ounces of onion seed. Let me say for friend Frank, I do not believe that, in all the fourteen years he has been in my employ, he ever made a mistake like that before. I had the order in my hand, it is true, and I noticed that the man had put the old price on the potato-planter; but I did not go through the other items; for where I have good careful helpers I do not give my attention to these little details now unless the clerks come to me for something that is not clear, and needs my maturer judgment.

You may wonder why I have given this illustration. Well, there are several points I wish to make right here. The first is, that every thing of this kind gives the man who is building up a business an excellent opportunity to prove to his patrons that he is not altogether "after the almighty dollar." Somebody wrote a few days ago, "Mr. Root, for certain peculiar reasons I was going to send my order for seeds somewhere else this time; but when I got a letter from you, inclosing 5 cents in stamps, saying I sent that amount too much for the things I ordered, it turned the scale. I am going to continue doing business with a man who is so conscientious that he takes a two-cent stamp to send back 5 cents that was left over."

Now, we did not do that because we thought it would pay, or advertise our business, but because we decided it was the only fair, straight, honest way. Five cents is not enough to place to a man's credit, and our book-keeper decided it would be the best and simplest way just to send him the surplus, even if it did cost a little to do it. We want to be right and square with our friends in every deal. We want *all* of our clerks to lose sight *entirely* as to whether money comes into our pocket or that of somebody else, in every transaction. We want to love our neighbor as ourselves.

I am now going to say something that will sound very much like boasting and bragging; but if you will wait till I get through with my story, perhaps you will change your mind. First, if this transaction had passed through my hands I do not think I would have overlooked the fact that this man sent nearly ten times as much money for his onion seed as he needed to. The reason is this: When I first started the seed business (and, in fact, when I started GLEANINGS), I felt so thankful to every one who sent me an order, or decided to subscribe to our little journal, that I tried to show my gratitude by reading his letter over carefully just to see if I could not give him a "happy surprise" by doing

a little *more* for him than he expected me to do. It has been a great pleasure all my life to see if I could not, according to the terms of my advertisement, do a little more for the man who trusted me with his money rather than do a little less. It is this fashion, or sort of spirit, if you choose, that has built up our business. I know there are some who, every little while, throw out flings about the Root Co., saying they are grasping and greedy—after the almighty dollar, etc. But I do not feel troubled about such things now as I once did, because anybody who follows us up, and gets acquainted with us, knows it is not true. A single transaction may look bad; but if an explanation is asked for, I think it will be forthcoming. It is not fair to judge a man by a single incident.* We must look at his record all along, day after day, week after week, and month after month. Well, this fashion of mine, of trying to do a little more than I agreed to, is one thing that has built up our business. I am sure the boys feel just as I do about this, although they may not have the peculiar gift that God seems to have granted me to talk things over and make an explanation and make things pleasant.

Now, that is considerable bragging, is it not? But I want to brag just a little more, before I take the other side. In all my years of business, amounting now to about fifty, I have been averse to going to bed at night until every wrong was righted—that is, so far as it could be. If I gave a man an ounce of onion-seed and took his money for a pound, I could hardly go to sleep until I had sent him the other 15 ounces. If it was the other way, and I had given him a pound by mistake, and charged him for only an ounce, *then* I felt disturbed. Funny, isn't it? Well, the funny part of it is that sometimes the man would pay me for the 15 ounces he got by mistake, and sometimes he wouldn't. A good friend in Pennsylvania (I might give you his name, but I guess I will not) once by mistake received a receipt in full on all accounts up to date. At the time that receipt was given he had a big box of foundation that was not paid for. He held on to his receipt up to date, and said it covered the whole matter, and said he would not pay us a cent more. I labored with him for over a year, and finally induced him to admit that he had not paid for that lot of foundation. He said, however, he was a poor man, and hadn't the money then, but, God helping him, he would pay it all. After that he got over into Satan's hands again and repudiated the whole thing. We put it in a lawyer's hands, and spent some

money in trying to collect it. The decision was, that his contrite letter, admitting his indebtedness, was wrung from him under great pressure, and would not stand law.

Now, I believe it *is* true that I have all my life been troubled just the same, whether the money that was lost went into my pocket or into that of somebody else. This thing was true, even before I became a follower of Christ Jesus—that is, to a great extent. I seem to have been "built that way," and therefore no very great credit is due me. I think the credit belongs more to my good father and mother for having so carefully taught me to be honest and square, even in my childhood days. Now, if you will excuse so much boasting we will talk about something else; but we shall probably get around to the same subject before we get through.

Last Sunday evening our pastor gave us a sermon on the life of Jesus Christ. He said, among other things, that Jesus never preached a temperance sermon; he never gave us a sermon on gambling. He warned us against licentiousness and other evils, but he did not exhort mankind to be specially careful in regard to any one sort of sin. He said, "Blessed are the pure in heart, for they shall see God," and that covers the whole thing. If the heart is pure, and in it is an honest, sincere love for truth, righteousness, temperance, and purity, then these other things are all unnecessary; and, in fact, the only real remedy for sin in all its forms is a change of heart. Christ said, "Ye must be born again;" and this new birth means that the whole being shall be filled with the spirit that stirred Christ Jesus when here on earth. I told you I am naturally unselfish where money matters are concerned. Let us take a glimpse of sin where money does not figure.

A daily paper of April 12 tells us that Prof. Joseph M. Miller, a Detroit music-teacher, has just been arrested for the murder of a beautiful young lady. Let me make just one brief extract from that paper:

"When did you make up your mind to kill the girl?" Miller was asked.

"Last Wednesday afternoon," he answered. "I was thinking of what could be done, and of my being married and with a family, when my eye fell on a hatchet up at the house. It seemed to tell the way out of the trouble, and the idea of killing the girl swept over me with irresistible force then."

"I felt that I had to do something," he went on in a lower tone. "I felt that I had to get rid of her. She was infatuated with me, crazy after me, and constantly chasing me. If I gave a concert anywhere she was sure to be in the neighborhood."

I read over very carefully once or twice the particulars as given in the daily, and I wish to paraphrase the account a little—that is, I will supply some things from my imagination that may be true in this case or may not be true. Let us suppose this music-teacher was acquainted with the father of the girl. He was a married man, and had children of his own, we are told. These two men may have been friends. All their deal may have been honest and square. This music-teacher may have been just as

*We clip the following from the *Morning Star*, of Boston, Mass.:

It is easy to suspect a man of being a rascal, to charge him with being a rascal, and even to prove him a rascal, provided that lies are good evidence, and he has no opportunity of contradicting or disproving them.

But suppose when you have proved that man is a rascal, the man himself refuses to be a rascal. What can be done then? Proving a man a rascal does not make him one—it MAY only show the rascality of those who have tried to blacken and defame an honest man.

honest and fair in money matters as I am, and may be more so. In teaching music to his pretty young pupil they became more and more acquainted. No doubt, conscience warned both of them that they were treading on dangerous ground. But Satan was carefully and slowly, yet *deliberately* "beguiling" them both. They both knew it, no doubt, and both knew it was Satan's work; but it was so fascinating that both decided to go just a little further with it. Let me tell you some things the paper did not tell. This young girl taking music-lessons became a very *apt* pupil under the stimulus of this new experience that had crossed her path. She showed wonderful proficiency, and perhaps her teacher never before found a pupil who followed details and profited by careful instruction as she did. At the same time, this music-teacher, too, found *new enthusiasm* in opening up and unfolding the science of music to his bright and skillful pupil.* Oh! I know how it goes, God knows. I know all about these things. Things finally came to a pass where both decided to stop; but they did not know, and humanity, without the help of Christ Jesus, *never will know*, the danger that stood before them. They were both standing in the rapids just above the brink of Niagara, and yet they could not be made to see it. Both struggled in vain. They grasped hold of rocks and bushes, and as drowning men catch at straws to save themselves; but the current was too strong. They went down.

The last paragraph in the quotation I have made tells the story. He says, "She was infatuated with me, crazy after me, and constantly chasing me." To be *sure*, she was. When he should have been teach-

ing her music, and music only, as he had agreed to do with her father, he was teaching her "infatuation." He deliberately *made* her crazy after him. How could she do otherwise than "chase" after him, especially when the time came when he wanted to avoid her, for they stood together in the relation of man and wife, even though he was a married man with a family already? This thing could not continue. He urged her to go to an asylum and be cared for. I suppose there *are* "asylums" for just such unfortunates. She knew what this meant, and knew the ruined life that stood before her. She refused to go, but at every opportunity plead with him to desert his wife and children and run away with her, away off where nobody would ever find out that they two were not *legally* man and wife. Why didn't he do this? He had told her perhaps a thousand times that he loved her more than he did his wife and children or any thing else in the world, and she believed him. He reasoned that, if she could be put out of the way, he could hold up his head in the world as he had been doing, and keep on with his profession. The prince of darkness that first started them on this downward career kept following them up. He urged this girl to get the married man to run away with her; then he put it into the head of the music-teacher to put her out of the way. He yielded to Satan's suggestions, and brutally murdered the girl he had professed to love—the girl he had deliberately *led* astray, for he was much the older of the two. Murdered her—how? *With a hatchet!* This he confesses.

Now, this professor of music and this pupil of his were both honest and upright. I take it—people in good standing. They were honest in their deal. They did not think in the outset of being untruthful, nor of stealing anything from anybody; but, oh my God! what an end this little harmless transaction had!

I have given the above as a warning; and I have given it, too, to illustrate how people who are honest in dollars and cents may commit a still greater wrong than robbing their neighbor of hundreds or even thousands of dollars. Men are not all tempted alike; they are not all "built" after the same model. Before my conversion to Christ Jesus I loved truth and honesty in money matters; but it was a negative virtue. But when reading that account of the music-teacher and his pupil, it burst on me that, had it not been for the saving power of Christ Jesus, my Savior, my record *might* have been like that of that poor unfortunate man who is now on his way to prison for life; and were it not (even now) for the constant presence of the spirit of this dear Lord and Savior in my heart I might not be much better than the music-teacher. While I would not for a moment discourage people from signing the pledge, and doing every thing they can in every way to "rescue the perishing," yet I feel again and again that the only safe and perfect remedy

* There is nothing else in the world that will so suddenly open up and develop and bring to the front the powers and ability of either man or woman as the stimulus of this thing called love between the sexes. It is like the unfolding of a beautiful rose when the sun suddenly comes out after days of clouds and days of storms. In a few months or even a few weeks a girl shows an ability, skill, and intelligence, as well as ambition, that she has never exhibited to anybody before in her life. In fact, she did not know herself what she could do until some good man (or you may say some man whom *he thinks* to be good) has told her of the story of his love; and unlawful or criminal love has much the same effect. A man sometimes excuses himself—we will say a music-teacher—and *gives*, as an excuse for paying so much attention to a certain pupil, that this particular pupil has rare *ability*, and is going to make a stir in the world. Perhaps her rare ability becomes manifest because he himself has given her more attention, and has put more enthusiasm into his business of developing her latent talents, than he ever gave any other pupil before in his life. This stimulus and enthusiasm are all right. They are some of God's great gifts. Sometimes where a man of great ability marries a woman whom the world calls "beneath" him, if he truly loves her he may in a little while raise her up to his own level—yes, even though she lack education in her youth, and refinement; and even though she had no taste for music and the sciences, this man may, by his love and devotion, lift her up and develop her, and cultivate in her a taste for things she would never have thought of nor cared for at all under other circumstances, and this thing is all right. It is one of God's most precious and greatest gifts. But Satan gets hold of it, just as he gets hold of every thing that is pure and good (if he can), and simply uses it to bring about ruin, shame, and crime.

for all these dangers is in accepting Christ Jesus as the redeemer of mankind, and putting your hand in his, and letting him lead—in uniting with Christian people, and in making the Bible your daily study—in asking him *daily*, in the language of David, to “create in me a clean heart, and renew a right spirit within me.”

Since the above was written we learn by the papers that Prof. Miller has been sentenced to the penitentiary for life, and that sentence was passed within 72 hours from the time the murder was committed. May God be praised for the fact that the law does *sometimes* nowadays meet out a *swift* punishment as well as a *sure* one! Now, then, may all the world understand that there is no need of lynching, especially when it is possible *by law* to try a man and sentence him within three days from the time the crime was committed.

PURCHASING REAL ESTATE WITHOUT SEEING IT, IN ANSWER TO “SPREAD EAGLE” ADVERTISEMENTS; ANOTHER “FLORA” HOME.

Dear Brother Root:—How I would enjoy grasping your hand and having a good talk! I have taken GLEANINGS nearly all of the time since you began its publication. Your Home talks have been of great interest and help to Mrs. S. and myself in times past; and now when we are in trouble we come to you for such help as you may give us, and to caution others who may be on the point of making the same disastrous move we have done.

First, we wish you to notice the principal reasons why we came to make our mistake; namely, having confidence in publishers and advertisements inserted in our great and trusted religious papers, the *Christian Herald*, *Christian Endeavor World*, and others. I firmly believe it the duty of every editor and publisher of a religious paper to be positively certain that every thing contained in their papers, from beginning to end, be clean and reliable, and to refuse all unclean, doubtful, and fraudulent advertising, regardless of the money loss to them, and I believe that they will have to answer in the future for all the loss, injury, and suffering caused by accepting fraudulent advertisements.

We are now in the widely advertised Maywood Colonies, Corning, Tehama Co., Cal., under the management of Foster & Woodson. I inclose, under another wrapper, a copy of a booklet such as have been and are now being sent all over the world by the tens of thousands; also a copy of a regular paper published by Foster & Woodson, and sent in like numbers, telling of the fine chances here to live and make money by fruits and vegetables, etc. Please read them carefully, and then you can realize the situation, and the fraud and injury being done to people in all parts of our land. It is a fraud to conceal a fraud; and before God I can not keep quiet and let matters move along as they are doing, and not let our good people know something about this place. I shall tell only the strict truth, and might add a great deal more with a clear conscience. Doubtless I shall have to suffer severely for doing my duty thus far. Foster & Woodson are selling land right along to outside people everywhere, and people are coming in continually, who have bought land in the past, most of them having had it planted out to trees for some time. Upon arrival they find things in bad shape—trees extremely small and poor, many dead, land in bad shape, and much of it very poor, and the outlook discouraging for any profit in the future. Disappointment and trouble are the rule. When they try to sell out at almost any price, they find no one to buy, as there is a general dissatisfaction and desire on the part of almost every one here to get away if possible; but they can not sell their property.

On our way out here we became acquainted with a fine gentleman and wife from New York, who owned an orchard here, planted two years before for them. They stayed some two or three months, lost nearly

\$2000, and returned home. There is good reason to believe that there are very many similar cases happening right along. Vegetables will not grow here to any extent without water, and trees do not do much better. There is no way to get water except by power pumping, as wind power is nothing but a plaything. To put in power pumps costs too much, for each one has to look out for himself, and most of the people here have already spent about all they have on land, trees, and buildings. Those who had most have lost most. I would say to all, *don't* spend your money on property until you have seen the place yourself, and *then* not in a hurry, as there are many things that are wrong, and to be found out only by waiting. Above all, do not believe what is told by a lot here who wish to sell out.

Two years ago, after reading a great deal about this place in books and papers similar to those sent you, and seeing advertisements and notices in the papers named, and others, we bought five acres of land here at \$50 per acre. Last September we sold our nice little farm and stock in Massachusetts, stored our furniture to be shipped later, and came to this colony—myself, wife, and a large family of boys and girls. We found the place very drear. There were three saloons, an open bar in the Liersch Hotel, and one also in Hotel Maywood, owned by Foster & Woodson.

There was practically no fruit to be seen, as there was none grown last year to speak of, on account of a freeze in April. We began to look for work at once, but could find none far or near until into November, and, when obtained, it was of the very hardest and most disagreeable kind. Up to date all the work possible to obtain has amounted to just \$66.85, and yet we have all been anxious to work. All the money we had left upon arrival was spent by Nov. 1; since then we have simply existed in a destitute and nearly starving condition, as we were bound not to go in debt, even if it had been possible. The above amount has been all we have had to live on for five months—eight of us. What we have suffered, God alone knows. Our land is unsalable at any price. We have lost our all, and are left in a strange land among strangers, destitute, discouraged, nearly starving and homesick beyond description. When east we had plenty of every thing; here, nothing; and no ray of hope for the future. All our hopes for our children are blighted unless we can get away.

If it were possible for me to return to Massachusetts early this spring I could, by working at my profession, earn enough to keep us through the summer and pay the passage of my family back east in the fall. But how can I obtain the means to return? I can not borrow it, for I have no security to give any one, except my word, a good character, clean industrious habits, a good profession, and good references. We trust God will open a way out in some form.

Yours in brotherly love,

Corning, Cal., Mar. 24.

I have given the above entire because it tells the story better than any thing else can. The accompanying booklets and periodicals picture the locality as a veritable garden of Eden; the finest illustration of California groves and fruit had been gathered the State could furnish, and these were supposed to represent the locality in question. While the above letter is doubtless a truthful statement, I am inclined to think it gives rather the dark side. In almost all such places I have found men who are experts, and who have probably an abundance of means, who have made very pretty places in spite of the discouraging surroundings; but I found whole towns of people, both in Florida and in California, who were very greatly disappointed in just about the way our brother has pictured it out to us. Now, dear friends, take warning before you are “*beguiled*” by these enticing pictures seen in the advertisements of real-estate dealers. I am pained almost every day to see whole pages occupied in Christian home papers by such advertisements; and I really fear it is a fact that religious papers open their columns to such swindles when the average

purely agricultural periodical would not sell the space for such a purpose at *any* price. I hope our religious papers will read the above letter. The writer has asked us to withhold his name in print, but we can furnish it whenever it is wanted.

FARMING WITH GREEN MANURES.

More and more attention is being paid to this matter, especially since farm labor is so high, and it is so difficult to get skillful help at any thing like a moderate price. Green manures are right on the land where you want them. All that is necessary is to plow them under. Then comes the problem of getting as much humus as possible to plow under the soil at once. The book I have so often spoken of, "Farming with Green Manures," gives several plans for getting two or more crops to plow under with only one plowing. From the *Country Gentleman* for March 27 I clip the following:

Before July I cut a piece of hay land, then plow down the sod or stubble; then sow two bushels of cow peas to the acre right on the furrows; then put on a disk harrow or a Clark's cutaway until I have a good seed-bed for buckwheat; then sow one bushel of buckwheat per acre; harrow and roll; then wait. The buckwheat will make headway above the cow peas, and, when in bloom, make one wonder where the cow peas are. Buckwheat ripens and comparatively disappears. Now the cow peas assert themselves, and one soon wonders where the buckwheat is.

About the middle of September I sow *right over the top* of the cow peas two bushels of rye per acre. The shade and retained moisture of the cow peas cause the rye to soon germinate, and with the first frost the cow peas are killed. Now comes the time for the rye to assert itself, which it does so well that, before winter comes, there is a fine stand of rye, which is again protected during winter by the dead cow-pea vines.

By corn-planting time next May I have a fine growth of rye, waist high. I now attach a heavy chain to the beam of the plow and outer whiffletree and *wrap* under the whole mass of vegetation completely out of sight. If you think it is easy fun, try it. It sometimes gets to be such tough fun that I have to put on the cut-away harrow and cut all up before plowing under. *It has not interfered with capillary attraction.* I now plant my corn.

With the above arrangement we get three crops to plow under with only one plowing, and would thus lose the use of the land only from, say, July 1 till corn-planting time next season. I have not tried the experiment, but I have grown cow peas, buckwheat, and rye all separately, to be plowed under. I know from experience that the buckwheat will outstrip the cow peas; and I am pretty sure the cow peas will finally outstrip the buckwheat; and I think I know, too, that rye would come up and do grandly if sown right in among cow peas and buckwheat; but instead of planting corn the next May I would plant potatoes. A good growth of rye is the nicest preparation for a crop of potatoes I know of. The only thing that troubles me is that the buckwheat seed might come up among the pota-

atoes, and that would make as much work as to cut out weeds. A faithful use of the weeder might kill the buckwheat and not injure the potatoes. I can tell best about that by trying. I have seen buckwheat come up in potato-hills so it had to be pulled out by hand; but I think it was because the spring was so late we could not use the weeder as we should have done otherwise. The above arrangement would be the one for the bee-keeper, because he would get a full crop of honey from the buckwheat; and, with a favorable season, quite a little from the cow peas also. The best way to get this tremendous growth of rye under is to have a plow with a sharp revolving-disk coulter to slice right through the rye so it can not clog around the beam of the plow. We used such a one last season.

NITRATE OF SODA; CHEMICAL FERTILIZERS, ETC.

Mr. A. I. Root:—I have been reading your book on tomato-growing, and I see on p. 97 that your experience with nitrate of soda about coincides with mine. How is it that men like T. Greiner, Harris, and other shining lights, recommend it? In fact, I have not been able to detect any difference with any commercial fertilizer as yet, but have never tried guano. Now, Mr. Root, please recommend to me some brand that you know will be the best for extra early cabbage and early tomatoes; also other very early truck. My soil is sandy loam and clay loam; also some black loam with mostly clay sub-soil. I use a small greenhouse to start my early plants. As for potash, I can get all the wood ashes gratis; but the little lot I have just purchased is not very rich; but I want to do the best I can with early truck this coming season; and if I only knew just what kind of fertilizer to use I would try some. Any information you will impart will be thankfully received and duly appreciated.

What book on gardening would you recommend for me—one that is the most up-to-date? I have Henderson's Gardening for Profit, and Greiner's How to Make the Garden Pay.

Of course, I know good stable manure is the best thing; but I will not be able to obtain enough for this season's crop at present, and will have to resort to the next best fertilizer.

A. S. KITTREDGE.

Hamilton, Ind.

Friend K., I have never been able as yet to find any chemical fertilizer that did enough good to warrant the expense—in fact, I have hardly found any thing that did any good at all. Stable manure is all right, and pays every time. Guano is like stable manure, only it is very much more concentrated. It always produces a result, but it is too expensive to be even thought of. I have used up a 200-lb. bag of nitrate of soda, and have never yet been able to see that it did any good *anywhere*—that is, on my own ground. Poultry manure is all right, and my neighbor Hilbert has bought a 200-egg incubator, and is planning to fertilize his peach-trees with poultry manure. Of course, he expects the poultry to pay expenses aside from the manure they furnish. Hard-wood ashes have also, as a rule, proved beneficial on all kinds of crops. Where we burn up a big stump or a log-heap, there is always a marked improvement with any crop on that spot of ground. In conclusion, I believe our best authorities in almost all of our agricultural papers tell all questioners that one can not tell what will succeed in a certain soil without mak-

ing a test. Try some of the various fertilizers advertised, on little plots of ground, and do not invest in anything until you find by actual test that it gives good results on *your* ground.

In regard to books on gardening, after the two you mention I think I would have Terry's books on potato and strawberry culture; Gregory's little books on cabbages, squashes, and onions are all right. "Talks on Manures" was written a good while ago, but it is still a valuable book. Can you not buy stable manure by the carload in some large city not far away?

DIFFERENT VARIETIES IN THE MATTER OF
GARDEN SEEDS; HOW MANY KINDS
DO WE REALLY NEED?

A bulletin from the United States Department of Agriculture is just at hand, entitled, "A List of American Varieties of Peppers." How many do you suppose there are? Well, they have enumerated and named 134; and this same bulletin gives us the following piece of information in its preface:

In the Yearbook of the Department of Agriculture for 1901 it is stated that American seedsmen cataloged the preceding year "685 real or nominal varieties of cabbage, 320 of table beets, 340 of sweet corn, 560 of bush beans, 255 of pole beans, 320 of cucumber, 530 of lettuce, and an equally large number of varieties of other vegetables."

In counting the number of these varieties, names were included which differed from others simply by the addition of a descriptive word, such as "improved," "large," "early," or the names of persons, while other varieties, having attached to them unimportant descriptive words, such as "select," "new," and "choice," were not included.

I am planning this summer, as you know, to test a good many seeds on my trial-grounds in Northern Michigan; but when it comes to 685 kinds of cabbages I shall have to be excused. I do not know exactly what the Department of Agriculture thinks about it; but if these seedsmen do *not* get a good many kinds of cabbage seed out of the same bag, I think they *ought* to do so, and a halt should be called in this business. Our experiment stations, when they have made tests, have proved pretty conclusively that several seedsmen are up to the trick of putting a new name on some old well-known variety, and then booming it up to the skies. I have caught one potato-grower in this very trick. When I furnished proof of it so he could not get around it he did not say anything, for the simple reason that there was nothing to say. Now, our experiment stations in the different States are the ones to rebuke this sort of swindle. Amateur gardeners and hard-working people are sending to seedsmen four times the actual worth of certain seeds just because they do not know the same thing is well known, and on the market (under its *real* name) at a reasonable price.

IT LOOKED "SILLY"—OUR HAND POTATO-
PLANTER.

You ask about the potato-planter. I bought one of you last spring, and liked it very much; but the

ground must be well prepared for it to do its best. I could induce no one else to try it; they said it "looked silly," but it wasn't.

Serena, Illinois, Jan. 8.

MRS. J. BAGLEY.

Well done, Mrs. B. If those people who thought the little machine looked "silly" could see the people plant acre after acre, even to the extent of two acres in a single day, by one person, I think they would be the ones who would "look silly" with *their* methods. I think you make a good point, however, where you say the ground should be well prepared to do its best; in fact, the ground needs to be well prepared, no matter how you plant potatoes, to have them do *their* best.

SOME MORE EVIDENCE OF THE GOOD TIME
COMING.

WHAT DELTA COUNTY, COLORADO, HAS:

No jail.
No saloons.
A first-class creamery.
Fine schools and churches.
10,000 acres of land in orchard.
The finest vegetables ever seen.
Peach-trees which net \$20 each.
Cherry-trees which net \$15 each.
200,000 acres of land under ditch.
The largest and best cattle-ranges.
Pear-trees which run up to \$35 each.
The finest trout-fishing in the State.
25 carloads of honey to sell this year.
600 carloads of fruit to sell this year.
35 bushels of wheat per acre this year.
The finest hunting-grounds in the West.
Peaches 12 to 14 inches in circumference.
Potatoes weighing from 4 to 5 pounds each.
Apples which weigh from 20 to 24 ounces each.
Four out of six World's Fair medals for fruits.
The only canning-factory on the Western slope.
200,000 acres of the finest timber and grazing lands.
Coal veins—anthracite and bituminous—6 to 30 feet thick.
Apple-trees which net their owners from \$20 to \$30 a year.
Meadows which average five tons of alfalfa per acre each season.
Room for 1000 families who want good health, good schools, good churches, and good homes.
The most healthful climate in the world for those who have lung or throat troubles, catarrh, or asthma.
Four-fifths of all the first premiums offered on the various fruits at all fairs where she has been a competitor.
Write to the Delta County Board of Trade, Delta, Colo., for reduced rates and further particulars.

Do you want to know what the above has to do with the "good time coming"? Just this: These people have put at the very top the fact that they have no jail; and the next item explains the matter. Yes, they tell us about other things—25 carloads of honey to sell, etc. Yes, we have given a free advertisement, but they ought to have it. When the towns and the counties and all the United States shall get into a rivalry in regard to the inducements they have to get people to go in and live with them, and shall begin to mention, first and foremost, "no jails" and "no saloons," then we are on the march for the good time coming; and I do not know but I might add, also, that we start on the march toward "thy kingdom come, thy will be done on earth as it is in heaven."

MR. T. B. TERRY'S STAND ON THE TOBACCO
QUESTION.

We take pleasure in giving a place to the following clipping from the *Practical Farmer*, of Philadelphia:

NOT A TOBACCO MAN.

Good friends, you will have to excuse me from writing about tobacco, because I do not know anything

about it. I never saw a field of it growing. I have never been at an institute and heard its culture discussed during all my work in fifteen States. When a boy I signed a pledge to not raise, handle, nor use it in any form, and this pledge has been kept, except that I have bought some for wife to put around the edges of carpets to keep the moths out. That surely did not violate the spirit of my promise. Further, the institute men, as a rule, do not raise or use tobacco. No, there were seven of us in the Minnesota force before the holidays, and not one of them used it in any form. So you see I have had no opportunities to learn any thing about tobacco, except that I do not like rooms where the air is made impure by its smoke, or the floor filthy by its spitting. So, kindly allow me another subject.

May God be praised that the men who speak and teach at our farmers' institutes are, as a rule, clean men, even to the extent that they neither use nor encourage the use of tobacco, nor the raising of it.

Temperance.

STANDING BY ONE'S CONVICTIONS.

We clip the following from the *Sunday School Times*:

One boy, Harry Shepler, was in the signal service. Harry was standing one morning, by a sergeant, to report for duty at the canteen. He refused to do so, and the sergeant threatened to report him to the officer of the day. "All right," said Shepler, "go ahead. I did not enlist to be a bar-tender, but a soldier, and I will not report at the canteen." He was duly reported to the major, who sent for him. Shepler went with trembling knees, but with a steady heart, for he knew he was right. When he came before the major, that officer said to him:

"Are you the young man who disobeyed orders this morning?"

"Yes, sir; I am."

"Why did you do it?"

"Simply because I do not believe it is right to do what I was asked to do. I enlisted to be a soldier, and not a bar-tender."

The major arose quickly from his stool, and, extending his hand, said:

"Shepler, you are the kind of man we want. I am glad to see a man who has the courage of his convictions. You are not obliged to report at the canteen. Go back to your tent."

In a personal letter to the writer, Shepler, in referring to this incident, gave as the reason for his ability to stand firm, the fact that he would not dishonor his mother, nor the Sunday-school which had taken such an interest in him while he was a soldier.

The above illustrates something that often comes up; and I wish to say that, in all my experience in business matters, I have never known a young man to be the loser by refusing to do that which his conscience told him was wrong. Of course, there needs to be an enlightened conscience, and in some matters it would be very wise indeed for the young man to consult his pastor or some good Christian man a little older than himself. It is not only the boys who make blunders by being *afraid* to do right, but men who hold official positions the world over are afraid to do their duty. In almost every town in Ohio the mayors and marshals seem to have an idea that they will lose their influence with the people if they enforce the law, especially when it happens to hit somebody who stands well in community. But they are making a mistake. In fact, things have come to such a pass just now that the world is *hungering* and *thirsting* for men who are not afraid

to make the law a "terror to evil-doers," as the Bible says it should be. In a town near us, half a dozen liquor-sellers were fined, and given a term in jail. Among them was the proprietor of the leading hotel of the town. A great many people seemed to think the judge should either let him off on account of his position or else "let him down easy." And they even suggested to the judge that they hoped he would consider the landlord's standing and his family, and his position in town, etc. But the judge was not of that sort. He gave the landlord of the big hotel the same kind of "medicine" he did all the rest. Of course, the whisky men are all down on him; but all good people rejoice to find a man who did not hesitate to rebuke sin, when found even in high places; and this judge has all at once become exceedingly popular with the people of his district, simply because he showed the world he was not *afraid* to be impartial and *do right*.

THE LIQUOR PROBLEM; SOME ENCOURAGING WORDS FROM OUR OLD FRIEND L. C. ROOT.

I am always pleased with the attitude of GLEANINGS with reference to the drink curse. During all of its history it has taken radical grounds on the right side of the question. That was a large straw thrown in by Dr. Miller, p. 137 and the editorial comment brings encouragement to those who have to meet the discouragements which must be met by those who are interested in the work.

Just at present we are much interested here in Stamford, in the organized work which is being done through the local State and National Alliance work. I have been looking for some reference to the work in the Home papers. Truly it is a home topic.

Stamford, Conn.

L. C. ROOT.

It gives us encouragement to know that such a good substantial man as the writer above is right in the harness working with us. Friend Root incloses in his letter a little tract about the Prohibition Alliance. This tract gives us a lot of facts in regard to this organization, and can be had by sending 5 cts. to Oliver W. Stewart, 1518 Manhattan Building, Chicago.

1902 ITALIAN QUEENS.

From imported and home-bred mothers, by up-to-date methods. Tested, \$2.00. Untested, \$1.00; six, \$5.00; twelve, \$9.00. Full colony, \$6.00; three-frame, \$2.00; two-frame, \$1.50; add the price of queen. Discount on large orders.

Write for circular.

Rufus Christian, : Meldrim, Georgia.

Farm for Sale in the Grand Traverse Region. I offer for sale my farm of 87 acres - 65 cleared, 18 in orchard; plenty of water on the place, and a house and barn both close to the water. Will take \$1200 cash, or \$1400, half down and the rest on time. Is 7 miles from Traverse City, right on the bay; part is hilly and part is nice and level. Is within $\frac{3}{4}$ mile of A. I. Root's "Cabin in the woods." MRS. ANNA HEIMFOORTH, Bingham, Mich.

BEAUTIFUL SHELLS and curios from Florida. Collections of 30 varieties, named; postpaid, \$1.00. WM. S. HANSON, Ft. Myers, Florida.

QUEENS AND NUCLEI. - Untested queens, either 3 or 5 banded, 75c; 6 for \$4.25. Tested, \$1.00 and up. Nucleus, including untested queen, 2-fr., \$2.50; 3-fr., \$3.25; 4-fr., \$3.75. CHAS. H. THIES, Steeleville, Ill.

A Warranted Red-clover Queen, 30 cts.

An Offer for New
Subscribers.

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.30 and we will mail you the Bee Journal for a whole year, and also one of our WARRANTED LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red-clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. They will be mailed in rotation, beginning about June 1st, so "first come, first served."

Headquarters in Chicago for Root's
Bee-supplies at Root's Prices. . . .

A free catalog and a sample of the American
Bee Journal on request.

George W. York & Co., Chicago, Ill.
144-146 Erie Street.

A QUEEN FREE.

Our stock is the very best that money and experience can procure. Just give our stock a trial and be convinced. We will give one warranted queen free in July for every order for one dozen queens before May 1, in order to have you try our stock. Prices: Untested, each, \$1.00; 6 for \$5.00; 12 for \$9.00. Select tested, \$2.50. Tested, \$1.25. Two-frame nucleus and warranted queen, \$3.00; three-frame nucleus and queen, \$3.50. Send for our catalog of bee-keepers' supplies and our price list of Italian queens and nucleus colonies, with description of our strain of bees.

Queens!

Buy them of H. G. Quirin, the largest queen-breeder in the North. The A. I. Root Co. tells us our stock is extra fine. Editor York, of the *American Bee Journal*, says he has good reports from our stock from time to time, while J. L. Gandy, of Humboldt, Neb., has secured over 400 lbs. of honey (mostly comb) from single colonies containing our queens. We have files of testimonials similar to the above.

Our breeders originated from the highest-priced long-tongued red-clover queens in the United States.

Fine queens, promptness, and square dealing have built up our present business, which was established in 1888.

Price of Golden and Leather-colored Queens Before July First.

We guarantee safe arrival to any State, continental island, or any European country. Can fill all orders promptly, as we expect to keep three to five hundred queens on hand ahead of orders. Special price on 50 or 100. Circular free. Send all orders to

Quirin the Queen-breeder,

Post and Money-order Office, Parkertown, Ohio.

Listen, Bee-keepers! The Lone Star Apiarist

A new bee-journal in the great Southwest, the Texas bee-keepers' paradise.

It will tell you of more glorious fields in the counties south of Uvalde, superior to and more abundant in honey-yielding flora, promising to be one of the greatest honey-producing sections in the world. With flowing wells, and the planting of fields of alfalfa in addition to the fine natural resources there already. Its editor will tell about his extended trip through this wonderful land.

Subscribe now, \$1 a year. The *Apiarist* is not only for the South, but for all America and foreign countries too. Our company has purchased the *Southland Queen*, and now we have the only bee-journal in the South.

Advanced Bee Culture

Is a book of nearly 100 pages (the size of the Review) that I wrote and published in 1891; and I will tell you how I gathered the information that it contains.

For 15 years I was a practical bee-keeper, producing tons of both comb and extracted honey; rearing and selling thousands of queens, reading all of the bee books and journals, attending conventions and fairs, visiting bee-keepers, etc., etc. Then I began publishing the Review, and, for several years, each issue was devoted to the discussion of some special topic, the best bee-keepers of the country giving their views and experience. **ADVANCED BEE CULTURE** is really the summing up of these first few years of special-topic numbers of the Review; that is, from a most careful examination of the views of the most progressive men, and a thorough consideration of the same in the light of my experience as a bee-keeper, I have described in plain and simple language what I believe to be the most advanced methods of managing an apiary, for *profit*, from the beginning of the season through the entire year.

A new and revised edition, which includes the improvements of the past ten years, will be out June 1st. It will be as handsome a little book as ever was printed. The paper is heavy extra machine-finished white book, and there will be several colored plates printed on heavy enameled paper. For instance, the one showing a comb badly affected with foul brood will be printed in almost the exact color of an old comb. The cover will be enameled azure, printed in three colors.

Price of the book, 50 cts. The Review for 1902, and the book for only \$1.25. You can send in your order now, and the back numbers of the Review for this year will be sent at once, and, as soon as the book is out, a copy will be mailed you.

W. Z. Hutchinson, Flint, Michigan.

Business Bees!

Are the kind you want for honey. We have them in our select five-band strain. J. F. Aitkins, Reno, Nev., has been buying several dozen queens a year—last year 180; have his order for 100 in April. F. L. Craycraft, Havana, Cuba, bought about 200 in fall of 1900; also 100 last April; has placed his order for 100. These men are large honey-producers. They know what they are about. We are better prepared than ever to handle orders. Prices: Untested queens, \$1.00; dozen, \$9.00; after May 1st, \$8.00; tested, \$1.50; select, \$2.00. Send for circular. J. B. Case, Port Orange, Fla.

VANDE VORD rears Golden queens from the best honey strains; untested (from an extra choice Doolittle breeder) \$1.00, or 3 for \$2.25; tested, \$1.25 each. Geo. J. Vande Vord, Daytona, Fla.

POULTRY PAPER 3 Months

and book, "Plans for Poultry-houses," 10 cts. Paper one year and book, 25 cts, if you mention Gleanings (reg. price, 50 cts).
Inland Poultry Journal, Indianapolis, Indiana.

THE SPRAMOTOR
was awarded the Gold Medal at the Pan American Exposition. It has been adopted by the Russian, Canadian, Belgian and Australian Governments, and is in use at Experimental Colleges in New York, New Jersey, Delaware, Ohio, Illinois, Iowa, Ontario, Manitoba, Quebec, Nova Scotia, British Columbia, and awarded first place over eleven others in actual trial by the British Government. An 84 page copyrighted treatise on diseases affecting Fruit Trees mailed free.
Spramotor Co. Buffalo, N.Y. London, Can.

BETTER THAN SPRAYING.

Don't lug barrels of water around when spraying. Use the poison direct. Our

Common Sense Dust Sprayer

and Insect Extirminator is a most ingenious device that is rapidly supplanting the old methods. It blows the finely powdered dust into every nook and crevice. Reaches the bottom as well as the tops of leaves. Destroys insect life on plants, vines, shrubs and trees. Just as effective for vermin on poultry and pigs. More rapid than spraying. Descriptive circulars and testimonials free.
HILLIS DUST SPRAYER CO., Box 17, ST. JOHNS, MO.

JUST AS NATURAL as the old hen and a good deal more reliable. Doesn't break its eggs or make its chicks lousy. Doesn't stay off the nest and allow the eggs to chill but hatches every egg that can be hatched. **THE PETALUMA INCUBATOR**

Is absolutely perfect as to incubator essentials—proper application and distribution of heat and moisture, regulation and ventilation. For \$4 to \$24 eggs. We Pay Freight anywhere in U. S. Catalog free.
PETALUMA INCUBATOR CO.

J. F. MOORE, : TIFFIN, OHIO.

A NEW WIRE-IMBEDDING OUTFIT.

We have just gotten out a new wire-imbedding outfit that makes use of six dry cells. It is connected up with a multiple-point switch in such a way that a power of 2, 3, 4, 5, and 6 cells can be utilized according to the strength of the battery as a whole. This outfit is in every way superior to the one we have been sending out. It makes use of no liquids; there are no acids to corrode the fingers, and the whole thing is so simply arranged that any one can make it work. The price of the new outfit is \$3.00 instead of \$2.50 for the old one.

COME FOUNDATION ADVANCED

The continued high price of beeswax makes it necessary to advance the price of comb foundation. An advance of 3 cents a pound was made April 22. This advance is concurred in by Chas. Dadant & Son, Gus Dittmer, G. B. Lewis Co., W. T. Falconer Mfg. Co., and the principal dealers and agents. We are paying, and have been for some time, 3 cents per pound more for wax than we paid last fall when the present list price was established. We had hoped that, with the opening of spring, supplies would be more plentiful and prices be easier. From present indications we do not think prices will advance any further, yet the demand for wax is such that the price holds up to its present high level. The advance, which should have been made a month ago, is imperative. The revised list price is as follows, and the wholesale prices are also advanced 3 cents per pound.

NAME OF GRADE.	Size, and sheets per pound.	In lots of—			
		1 lb	5	10	25
Medium brood.....	7½x16½ 7 to 8	53	51	49	48
Light brood.....	7½x16½ 9 to 10	55	53	51	50
Thin super.....	3½x15½ 28	60	58	56	55
Extra thin.....	3½x15½ 32	63	61	59	58

BUSINESS BOOMING.

The demand for supplies this year in many directions is quite phenomenal, and indicates a prosperous condition with bright prospects. The demand for goods in all lines is very heavy, and prices of materials of almost every kind are advancing. Food supplies of nearly every kind are well up in price, and labor is better paid than ever before. In fact, money, the medium of exchange and the measure of values, is becoming cheaper when measured by the general average of commodities. During the past 4½ months we have made 85 carload shipments, and are still fifteen cars behind; and if we were in shape to take care of it there are other cars which we could ship which are now being turned away because we are not prepared to ship promptly. A number of our dealers are sold out of many items for some days and sometimes weeks before their next car reaches them. The forehanded people buy their supplies in the fall and winter, get them ready for the bees at their leisure, and are ready for business when the season arrives. An experience like the present should teach a much larger number the wisdom of this policy, and find them among these forehanded people in the years to come.

Several of our dealers, especially the managers of our branch houses, are usually able to handle their business with very little help, and, in a busy season like the present one, find it difficult to take care of the orders received, and their correspondence too; and, having no trained help, in many cases they are considerably burdened by additional correspondence in the nature of inquiries as to when goods will be shipped, etc. We trust, therefore, our friends will avoid writing regarding orders any more than necessary, provided you have received an acknowledgment of the order. If you must write about it, kindly state briefly what date the order was sent and the amount of money, if any, sent, and give the order number, provided you have received notice stating what it is. Mr. Salisbury, of our Syracuse branch, states that he is about a week or ten days behind on some of his orders, although others are going out with almost no delay, and the same situation prevails in other places, though we hope very soon to be fully up with our orders at Medina and our branches with the exception of carload lots.

BEES AND QUEENS.

In connection with and directly adjoining our large manufacturing plant we have an apiary of 600 colonies; and this is further supplemented by an out-yard of 150 more. Nearly all of these 750 are devoted to the rearing of high-class honey queens or queens for business. In charge of this department we have a queen-breeder of some 30 years' experience, careful and competent, and one who uses the latest and best methods for producing vigorous healthy stock. None but honey queens are used for breeders (usually imported) — queens whose progeny have excelled every thing else in the yard. Some of them are from our celebrated imported red-clover mother, the bees of which will excel any thing else in the yard during the time that red clover is in bloom. Then we have a breeder whose bees stored 160 lbs. of surplus from clover and basswood in a yard where there are already 650 colonies. A colony that can store as much honey as that in a locality so greatly overstocked is something remarkable, and hence the queen has been set apart as a breeder.

On account of the intrinsic merit of breeding stock and the pairs we take in rearing our queens, we are compelled (to prevent being swamped with orders) to charge a slight advance over ruling prices.

PRICES OF RED-CLOVER AND HONEY QUEENS REARED IN THE ROOT CO.'S APIARIES, AT MEDINA, O.

Untested queen.....	\$1 00
Select untested queen.....	1 25
Tested queen.....	2 00
Select tested queen.....	3 00
Breeding queen.....	5 00
Select breeding queens.....	7 50
Extra select breeding queens, 1 year old.....	10 00

Be sure to specify whether you desire a "red-clover" or a "honey" queen. The first-mentioned stock is bred for red clover; the last-named, or honey queens, show up well during an ordinary honey-flow from clover and basswood. We can not furnish these queens before May 15 (untested before June 1st) nor later than Nov. 15th. We are booking orders, and they will be filled in their season in rotation.

COMMON ITALIAN QUEENS.

For those who desire to get pure Italian stock at a moderate price we are prepared to furnish queens direct from our breeders in the South, or from our own yards. These queens may be just as good as our higher-priced stock. Some of our Southern breeders use our breeding-queens, and others use some of their own choice breeders.

Untested queens.....	\$.75
Select untested queens.....	1 00
Tested queens.....	1 50
Select tested queens.....	2 50

If untested queens are ordered before May 15th the price will be 25 cents extra.

PRICES OF NUCLEI.

One-frame nucleus, without queen.....	\$2 00
Two-frame nucleus, without queen.....	3 00
Three-frame nucleus, without queen.....	3 50
One colony of bees in 8 frame Dovetail ed hive, without queen.....	7 50

We can supply with the nuclei any of the queens mentioned in the table of prices of queens. When one buys an extra select queen or any high-priced queen he would do well to have her come in a nucleus. This will insure safe arrival, and do away with the hazard of introducing.

Kind Words from our Customers.

What seeds we have had of you have been extra fine and very large packets for five cents. I never made a success of getting ripe tomatoes until we tried some of your Ignomus seed. Quality of fruit the best I ever saw.
H. E. CAMPBELL.

Derby, Vt., Feb. 14.

I like GLEANINGS very much. It is the right kind of a journal for a Christian family table, it being opposed to the filthy tobacco habit, and is anti-saloon; and it advocates good Christian principles and morals. It is also a great help in the bee business. God bless the editors and contributors to GLEANINGS.

Montee, Wis.

HERMAN L. GLOEGE.

SOMETHING MORE ABOUT THE MUSKOKA REGION OF CANADA.

Mr. Root.—Speaking of the outing in the back-woods, we think it might interest you to know what we have been doing since you were with us in Muskoka. You will perhaps remember the little farmhouse away back from our camp, where you got the bread, and will recollect the lake straight out from the house, where you found the children alone. Well, in that lake we discovered, after you left us, a group of beautiful islands, four in all, about 12 or 15 acres. We made inquiries and found out that they were still government property. As soon as we returned to Toronto we investigated, and made a purchase of the lot from the government, for \$5.00 per acre. We talked it up, and others became interested, mostly relatives, and members of our church here. Six families united, and early last spring we had the lumber hauled in and quite a nice house built. It cost us about \$90 apiece, land and all. Our building is about 30x16 feet, two-story, built of dressed siding, painted yellow, trimmed with red, and with shingles stained green. It makes a very pretty appearance from the water, surrounded as it is by beautiful woods. Some of the trees that have been cut off the island are large enough to be made into lumber, and we expect to get several thousand feet of boards from them during the winter, and next year we purpose building a large veranda around the house. The situation is very beautiful. We get berries in abundance, and the fishing is also good. We get beautiful black bass, some as large as three or four pounds. There is also good lunge fishing in the lake.

Our lake is connected by small streams with a whole chain of other lakes to which we made very pleasant little excursions. In some cases the streams are just filled with thousands upon thousands of sweet scented water lilies, while the ever-changing scenery is very beautiful. Generally the land is rough and rocky, similar to what you saw on your trip. The water, as you know, is very soft, and suitable for bathing, but rather too warm for drinking. We were fortunate, however, in discovering on the mainland, just across from our islands, a beautiful spring where we get splendid water, soft and cold. We dug a hole and sank a barrel into the sand. I thought of you when I was helping to fix it, knowing how much you are interested in such things. We found there were quite a few settlers on the lake from whom we could get, at very reasonable prices, beautiful potatoes, and all other garden vegetables, milk, butter, eggs, etc. My wife and children were there about eight weeks. I took them in over the same course we traveled when you were with us; but we have another way of getting in from the railway station, by a very good road. The settlers, for a reasonable amount, bring us and our luggage in to the shore of the lake. We have found it a great benefit to us, the children especially. It was a sight not soon to be forgotten, to see them all playing in the nice clean sand, and bathing in the warm soft water. It was worth all it cost us to see the way they enjoyed themselves, and they are much better in health. It made us think of the poor little children who are shut up in the large cities, who never have such pleasure, and we often wished we could share it with them.

By a number uniting in this way we were able to have all the advantages and benefits of a summer outing, at a very small cost. After reckoning every thing up we found that it was cheaper living there than it would have been had we spent the summer at home in Toronto. Probably no one family connected with the club (which, by the way, we call the "Otiosus Club") would have been able to go to the expense alone; but by uniting in this way we all had the benefit and advantages of the company, which made it more pleasant. At one time we had about 25 on the island. Of course, some of them slept in tents. You have been writing lately on the subject of "paths." I may say that one of our greatest pleasures while in Muskoka was making paths from one point to another on our islands. Sometimes we were able to get all the young people, children and all, interested in it, and, oh, my! how they would work! and how they would eat afterward! What other pleasures are there which can compare with the pleasures we get from nature?

We hope some time we may have the pleasure of showing you the advantages and beauties of our summer home. I suppose you know that "Otiosus" is taken from a Latin word "otium," which means rest, recreation, leisure, etc., and our experience last summer proves that it has been rightly named.

Toronto, Can., Nov. 21.

E. GRAINGER.

CONVENTION NOTICE.

The Eastern part of the Northern Illinois Bee-keepers' Association will hold their spring meeting at the residence of C. J. Cummings, 2½ miles northeast of Rockford, Ill., on Tuesday, May 20, 1902. All interested in bees are invited to attend. R. KENNEDY, Sec. Rockford, Ill., Rural Route No. 5.

Fertilizing-boxes on Trial.

Last season we reared and sold a large number of queens, all of which were mated from Swarthmore fertilizing-boxes attached to 2 and 3 frame nucleus hives of standard size, thus securing 6 to 10 fertile queens each from colonies that would otherwise have given but one to the mating. We will gladly send a set of boxes to ten reliable bee-keepers for trial and approval; to be paid for when satisfied of success, or returned if found wanting—full directions given in circular.

The Swarthmore Ap'aries, Swarthmore, Pa.

Headquarters for the Albino Bee.

The Best in the World.

If you are looking for the bees that gather the most honey, and are the gentlest of all bees to handle, buy the Albino. I can also furnish Italians, but orders stand fifty to one in favor of the Albino. Select tested Albino queen before June, for breeding, \$4.00; tested, \$2.50; untested, \$1.00; Italians, \$1.00. I have located an apiary near Rocky Ridge, Md., and most of my queens will be shipped from there. Other supplies will be furnished from Hagerstown, Maryland. Address me at Rocky Ridge, Md., for queens. S. Valentine.

TEXAS QUEENS!!

From the Lone Star Apiaries. G. F. Davidson & Son, prop's, have made great preparations for the coming season to accommodate their many customers with either Long-tongue, Imported St ck, or Golden Queens. They have bought out the queen-rearing business of O. P. Hyde & Son, Hutto, Texas, and by buying and increasing their

number of nuclei, they are better prepared than ever to cater to the trade of the bee-keeping public. One of Root's Long-tongue Breeders; Imported Stock direct from Italy; Goldens from leading queen-breeders. Fine breeders of each of the above have been added to their yards. Safe arrival and satisfaction guaranteed. Send for queen circular and price list. We are now prepared to fill orders for Cyprian and Carniolan queens. Good strains. Address

G. F. Davidson & Son, Box 190, Floresville, Texas.

QUEENS, QUEENS

Old Standbys.—The A. I. Root Co., to whom we have sold queens for many years, wrote us last May, thus: "Are you running low on queens? We hope not, as you seem to be our standbys. Send us 24 per week instead of 12, till further orders."

Beat Any Thing He ever Saw.—The Cyprian queens you sent me last year beat any thing I ever saw rearing brood and filling their hives with honey.—J. Nielson, Huntington, Utah, Sept. 4, 1901.

Is Great.—The nucleus you sent me last fall is great—the finest queen that ever crossed the plains. Please duplicate her this time. Mr. Jordan says the nucleus you sent him cast two fine swarms.—G. R. Warren, Fruitvale, Cal., May 12, 1901.

\$50 Queens.—My nice queen that you sent me, and I put in a hive with a handful of bees on the 6th day of last June, has now nearly filled her 30-lb. super for the third time. No man's \$50.00 bill could take her. Please send me another one like her as soon as possible, and keep a dozen ready for me like her for the 20th of April next, and I will make you a nice present.—M. Brown, Station A, Little Rock, Ark.

We breed Italians, Cyprians, Holylands, Carniolans, and Albinos, in separate yards, 5 to 20 miles apart. Prompt service. Safe arrival guaranteed. Bees by the pound, nucleus, full colony, or by the carload.

Prices: Tested, \$1.50 each; \$8.00 for six; \$15.00 per dozen. Untested, February, March, April, May, \$1.00 each; \$5.00 for six; \$9.00 per dozen. Fine breeders, \$5.00 each. Send for our catalog, free by mail; tells how to rear queens and how to keep bees for profit.

Agents for Dadant's Foundation and *Gleanings*. Premiums given. Don't fail to get our printed matter. It's ALL free. Bee-supplies of all kinds.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch, \$1.10; 3-inch, \$1.00; 2½-inch, 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 23 years. Only three larger ones brass.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.

No. 2.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 3.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

BUFFALO.—Demand for honey is very slow. Fancy white comb, 14@14½; A No. 1, 13½@14; No. 1, 12½@13; No. 2, 11@12; No. 3, 10@11; No. 1 Dark, 11@12; No. 2, 10@11. Extracted white, 6@6½; dark, 5@5½. Beeswax, 28@30. W. C. TOWNSEND, May 10. 84, 86 West Market St., Buffalo, N. Y.

CHICAGO.—The trade in honey of all kinds is light; especially is this true of comb; the little trade that exists is for the best grades. Basswood ranges from 14@15; that having more or less basswood, willow, or other white nectar. 13; off grades of white, 10@12; amber, 8@9. Extracted white, 5½@6; amber, 5@5½. Some lots of new extracted offered, but no sales have been made. Beeswax is very scarce, and can be sold upon arrival at 32. R. A. BURNETT & Co., May 8. 199 South Water St., Chicago, Ill.

SAN FRANCISCO. Comb honey, 10@12. Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 27½@30. E. H. SCHAEFFLE, April 27. Murphys, Calif.

ALBANY.—Honey receipts light with little demand; season about over; old stock about all cleaned out and will be in good shape for new crop. We quote white comb, 14@15; mixed comb, 13@14. Extracted white, 6@6½; mixed, 5½@6. Beeswax, 30@32. MACDOUGAL & Co., May 6. 375 Broadway, Albany, N. Y.

TORONTO.—A No. 1 comb, \$1.75@2.00; No. 1 comb, \$1.50; dark, \$1.00. Bulk honey, extracted, 8½@9. There is very little honey moving, and, although having been a very light yield, there is still a good deal in the hands of dealers who will not be able to hold their own. Honey seems to be used only up to a certain price, and when it gets beyond that it won't sell. This has been the case this year. Good prospects for a big crop this year are almost certain. The bees have wintered well, and the clover not injured by frost. In view of this, those who have honey are anxious to get rid of it even at a loss. M. MAYER & SON, Toronto, Ont., May 3.

PHILADELPHIA.—The present honey season is about over with us in a retail way, and so little call that there are not enough sales to fix a price. Car lots of western honey on track, 5½; and in a retail way from 6@8, according to quality. Beeswax, 30c. I am a producer of honey, and do not handle on commission. WM. A. SELSER, May 9. 10 Vine St., Philadelphia, Pa.

BOSTON.—Our honey market continues about the same as our last report, with a light demand and ample stock. Last quotations were as follows: Fancy, 15@16; A No. 1, 14@15; No. 1, 13@14; honey in glass-front cases about 1c less. California light amber, extracted, 7@7½; Florida honey in barrels, 6@6½. BLAKE, SCOTT & LEE, May 8. 31, 33 Commercial St., Boston, Mass.

CINCINNATI.—As the warm weather sets in, the demand for comb honey is as good as over. There are no settled prices; for whatever is left, prices are made to force sales. Extracted honey is in fair demand, and finds steady sales. Amber is sold in barrel lots for 5@5½; water-white alfalfa sells at 6@6½; white clover, 6½@7. Beeswax scarce, and brings 30@31. C. H. W. WEBER, May 8. 2146 Central Ave., Cincinnati, Ohio.

WANTED.—Comb and extracted honey. State price kind, and quantity. R. A. BURNETT & Co., 199 South Water St., Chicago, Ill.

WANTED.—Extracted honey, either large or small lots; parties having same to offer, send samples, and best prices delivered, Cincinnati, O. We pay cash on delivery. THE FRED W. MUTH CO., Front and Walnut Sts., Cincinnati, O.

WANTED.—Comb honey in Danzenbaker sections. We can use both white and amber. THE A. I. ROOT CO., Medina, Ohio.

FOR SALE.—Extracted honey, from alfalfa, at 7c per pound. Send for sample. D. S. JENKINS, Las Animas, Col.

FOR SALE.—Whitest alfalfa honey, \$9.00; tinted, \$7.80, per case of two 60-lb. cans, net. ARKANSAS VALLEY APIARIES, Las Animas, Col.

FOR SALE.—Clover and sweet-clover extracted honey at 7c, in kegs and cans. DR. C. L. PARKER, Sta. A, R. F. D., Syracuse, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHHEIM, 1318-1324 Union Avenue, Kansas City, Mo.

Victor's Strain of Italian Bees Awarded the Diploma as Being the Best Bees at the Pan-American.

BUREAU OF AWARDS.

PAN-AMERICAN EXPOSITION, }
BUFFALO, NEW YORK, U. S. A. }
February 12, 1902. }

Mr. H. O. Victor, Wharton, Texas.

Dear Sir:—I have the honor to advise you that a Diploma of Honorable Mention has been awarded to you for your exhibit of Italian bees at this Exposition.

Very respectfully, WM. I. BUCHANAN,
Director-General.

Orel L. Hershiser Bought of Me an Untested Queen. This is what He Says of Her Colony:

"They are very industrious, characteristically marked, and extremely gentle. It was a daily experience, and repeated many times daily, to go into the inclosure with interested visitors, at the Exposition, open the hive, full to overflowing with beautiful bees, the progeny of the queen you sent me, and handle them in the various manipulations of hunting out the queen; shaking the bees from the comb, as is done in extracting, showing the brood in all stages, etc., all without the use of a smoker or any thing else to quiet the bees, and I do not recollect that any one ever got a sting from any of them."

Of the bees I exhibited at the Pan-American, he says: "The nucleus you sent for exhibition and award was certainly very fine-looking bees, and, in my opinion, they deserve the award given them by the judges."

But Who is Mr. Hershiser?

See *Gleanings* of date of Feb'y 1, 1902, page 97. Send in your orders for queens, and in a short time, as Mr. Hershiser and hundreds of others are now doing, you, too, will be singing the praises of "Victor's Bees." Price lists on application.

I Am Filling Orders by Return Mail from This Superior Stock at Following Prices:

Untested queens: 1, \$1.00; 6, \$5.00. Select untested queens: 1, \$1.25; 6, \$6.00. Tested queens: 1, \$1.50; 6, \$8.00. Select tested queens: 1, \$2.00; 6, \$11.00. Breeders, \$3.00 to \$7.00. See circular for specifications.

W. O. VICTOR, Wharton, Tex.
Queen Specialist.

Built for Long Service FROM THREE FACTORIES

We ship direct to the consumer. We make the most reliable line of vehicles, harness, etc., to be found anywhere and sell at the lowest wholesale prices.

We Handle No Low-Grade Work.

Strong, durable material and good honest workmanship make our vehicles and harness outlast two of the ordinary kind.

Write at Once for our guaranteed freight charges to your station on any vehicle. Carts from \$11.00 to \$38.75; Road Wagons from \$28.90 to \$105.00; Buggies from \$36 to \$42.45; Surreys from \$52.20 to \$120.12; Spring Wagons from \$37.50 to \$112.50; Farm Wagons from \$31.55 to \$65.65; Single Harness from \$4.50 to \$20.20; Farm harness from \$12.50 to \$39.00.

WE SEND FREE the largest illustrated Vehicle and Harness catalog ever issued. Send for it. **CASH BUYERS' UNION, Dept. E-345, CHICAGO.**

Wants and Exchange.

WANTED.—Comb honey in Danzenbaker sections in exchange for supplies, or will pay cash. We prefer large lots of white honey, but can use some amber in this size. **THE A. I. ROOF CO., Medina, Ohio.**

WANTED.—To sell Rocky Ford cantaloupe seed. Seed of these famous melons postpaid, 40 cts. per pound. Choice selected stock. **H. F. HAGEN, Rocky Ford, Colorado.**

WANTED.—To know who has 200 colonies of bees to sell cheap; also what young man would like to serve an apprenticeship with Quirin the queen-breeder. **H. G. QUTRIN, Parkertown, O.**

WANTED.—One dollar for 15 W. P. Rock eggs; \$5.00 for 50, or \$5.00 for 100; from 93 to 95 scoring birds; cockerels and pullets, \$1.00 each; 75 cts. for one Golden Italian queen, or \$8.00 per dozen—after August 1st, 50c each or \$5.00 per dozen. **GEO. W. COOK, Spring Hill, Kansas.**

WANTED.—Bee keepers to study our advertisement and testimonial of queens in April list GLEANINGS. **R. F. HOLTERMANN, Manager Bee Department, Bow Park Co., Limited, Brantford, Canada.**

WANTED.—Second-hand or knocked-down hives. Describe them, with price. Also want a man who knows how to handle bees a little. **W. L. COGSHALL, West Groton, N. Y.**

WANTED.—To exchange sails, spars, and rigging of 20-ft. boat, for small printing-press, foot circular saw, wheel hoe and seeder, bee fixtures, or any thing useful. **J. H. CHASE, 1364 N. Ave., Bridgeport, Ct.**

WANTED.—To sell bees and queens. Also putty-knife with iron handle and strong steel blade—just the thing for prying and scraping about hives, etc., 15c postpaid. **O. H. HYATT, Shenandoah, Ia.**

WANTED.—An offer for 150 good heavy-top brood-combs; Root size. **W. W. KULP, Pottstown, Pa.**

WANTED.—To sell 70 hives of bees, some nuclei, stands, and frames; good condition; many fixtures. Write quick. **CHAS. G. MILLER, Cuero, Tex.**

WANTED.—To sell from 40 to 50 Italian and hybrid colonies. **AUGUST NIGABOWER, 19 Center Street, Iliou, New York.**

WANTED.—Prices on comb and extracted honey, and sorghum. **L. R. BIDWELL, Watonga, O. T.**

WANTED.—A printing-press, or best cash offer for the following: 125 eight-frame dovetailed extracting supers, 5½ deep; 1000 closed-end frames for same; 175 eight-frame comb-honey supers, 17½ long inside by 4½ deep, with flat tins. All the supers are 19 inches long, outside measure, and are new goods in the flat; 25 covers for the above nailed and painted; 10 wood-zinc queen-excluders; 8 lbs. section foundation; 5 lbs. brood foundation; 1 Bingham uncapping-knife; 2 queen-traps; 1 queen-clipping device; 1 smoker. **E. W. BROWN, Morton Park, Cook Co., Ill.**

VOL. XXX.

MAY 15, 1902.

No. 10

IF I LIVE till next winter I think I'll try a few colonies, taking them out every day warm enough for them to fly and then returning after the flight. [Yes, do.—ED.]

MARCH 27, three days after the blooming of soft maple, my bees were taken out of cellar. The next three or four weeks were pretty bad; and if bees will stay contented after returning, it might have been better to have returned and left them in the cellar till April 21, when dandelions were in bloom. [Yes, I think so.—ED.]

ARABIAN HIVES are long, and it is almost impossible to drum bees out of them. M. Bourgeois, at Tunis, says in *Progres Apicole* that he gets them to swarm out in the following manner: He catches the young queens of a second swarm (in one case 53 in one swarm), cages them, and puts the cages in colonies he wishes to swarm. In two or three days the swarms issue.

ADRIAN GETAZ figures in *American Bee Journal* that a colony of normal size uses for its own support at least 200 pounds of honey in a year. If that be so, it makes it easier to understand how it is that, while one colony stores a surplus of 40 pounds, another beside it stores twice as much; for, as he explains, the better colony will not need to gather twice as much, but only a sixth more, one gathering 240 pounds and the other 280.

ADULTERATORS are having a bad time elsewhere as well as here. One Breitenstein at Stein, Switzerland, was selling Chilian honey as Swiss honey. The Bee-keepers' Association prosecuted him, and he was glad to get off by paying costs and making a signed paper for publication confessing the fraud, and promising not to do so again. [The adulterators in this country are not having nearly as bad a time as they ought to have. If bee-keepers will look to their State legislatures we can make

it much hotter for the mixers than we are able to do now.—ED.]

EDITOR DOOLITTLE says in *Progressive* that queens giving peaceable bees in the South are quite the opposite with him and further north. A queen returned to him from Wisconsin because her bees were insufferably cross was sent by him to the extreme South, and the report upon her workers was, "They are the most peaceable bees I ever saw." Now, is it possible that all queens sent from the South produce such vixens in the North?

FOR THE FIRST TIME I find a reason given why queens prefer new to old comb. *Le Progres Apicole* says it is because new combs are more easily warmed. But so are they more easily cooled; and the important thing is to have combs that will not allow the brood to become chilled on cool nights. Moreover, whatever may be true in France, in this locality old black combs are always preferred by the bees, either for brood or honey.

FORMALIN should have a fair trial for foul brood this year. If it kills spores in larvæ, sealed cells, and honey, it's a boon. [Can't you tell us, doctor, just how the European bee-keepers administer formalin to a colony of bees—the quantity of drug, etc.? It can be easily obtained in this country; but I should doubt very much whether it would kill the spores of foul brood. If they can resist a temperature of boiling water for an hour or two, the drug must be exceedingly powerful.—ED.]

IT'S POSSIBLE, Mr. Editor, that "one-sided board combs," mentioned p. 387, may be better than you think. The cells do not need to be any deeper than usual. Don't bees do nearly as well with separators in supers as without? and would not the proposed plan nearly double the number of separators? At any rate, it could be easily tried. [You just try putting a separator down between your extracting-combs, and see how well the bees will do in storing honey. Don't you recall how disinclined the bees are to go outside of the division-board and store honey in a comb that may

be left on the outside? In the case of a comb-honey super the separators are comparatively narrow. They are slotted at the top and bottom so as to reduce the width, in many instances; and now that the fence is so rapidly pushing its way forward, the separator or fence has transverse slots that allow the whole cluster to mingle together. Say—perhaps you can tell us with what success the one-sided combs are used in Germany. They were talked about at one time; but, if I am correct, there was nothing but talk outside of a few isolated experiments.—Ed.]

ADRIAN GETAZ says in *Amer. Bee Journal*, "a colony of bees of normal size consumes something like 200 pounds of honey every year, at least, and probably more." So if a colony gathers 240 pounds there's 40 surplus, and gathering 280 makes 80 surplus. So he says increase the gathering $\frac{1}{2}$ and you double the surplus. That makes it easier to understand how there can be so much difference in the surplus of two colonies of like appearance. [There is probably a great deal in what Mr. Getaz says; but is he not figuring pretty high on the amount of honey actually consumed for the whole year? D. A. Jones once had an apiary on a barren island in Georgian Bay, for rearing Holy Land bees. He had another for the rearing of Cyprians on another island. The only food these bees had was syrup that he gave them, as there was nothing on either island that they could get, except a little pollen, perhaps. I can not now remember the amount of syrup required per colony, but the figures were nothing like 200 pounds. He kept them at brood-rearing to their fullest capacity; and any one who is familiar with those Eastern races knows they rear brood to excess.

It would be interesting to know whether this 200 pounds of honey per year is an estimated figure or one obtained by taking account of syrup actually fed in a locality reasonably barren of natural flora.—Ed.]

THANKS for that editorial about Post check money, p. 370. I never fully understood it before. Why, it's immense. Without troubling to go to a bank, express office, or postoffice, you can at any time take a bill out of your pocket and write two names on it, and then it's ready to mail. In spite of the risk, hundreds of dollars in bank bills are sent through the mail now. That would take away the risk. [I hope, if you (and, in fact, all the readers of GLEANINGS) have not already done so, you will immediately write to your Senators and Representatives in Congress. It is not sufficient to wish devoutly to have Congress act on a certain desirable measure. It is our privilege and duty to sit down and write to our members of Congress to give this or that measure their support. Sometimes I think our people do not realize that this is a *representative* government, and that every one should have something to say about the laws that shall be made. Out-

side of abolishing the canteen at our army posts, I do not know of any national measure that interests me more than this Post check money. It would prevent the contracting of disease in perhaps thousands of cases; it will save life and property, because it will absolutely remove the temptation to rob the mail, either on the part of desperadoes that hold up a whole train, or postal clerks who are not strong enough to withstand temptation, because they know that many letters contain money that they fancy they can abstract and escape detection. Besides being a great convenience to the people and a saving of life, this is a moral measure that may be the means of saving some poor mother's son's soul.—Ed.]

CHANGING from frames 18×9 to the regular size I've had hundreds of frames and combs to transfer, and after trying strings and wires for fastening combs in frames I much prefer the wires. Cut the wire in proper lengths, lay three of them under a frame, one at the middle and one near each end; put your comb in the frame, then fasten the two ends of each wire together by twisting at a corner of the top-bar. The fine wires are easily broken at any time after the bees have fastened the comb in place, although they may do no harm if never removed. Of course that will work only when combs are in pretty large pieces. If pieces are quite small I'm not sure but it might pay to use the plan given on p. 364. The nails would make no trouble when uncapping, for they are left "projecting $\frac{1}{8}$ inch" so as to be drawn when the comb is fastened. [While a wire might, perhaps, be more convenient than a string, in the manner in which you use it, yet just think of the labor of driving little nails along the edges of the brood-frame, stringing wires up over them, pulling them off again, then afterward pulling out the nails! Your plan of using the wires is vastly better; but I can not help feeling that a string is better still, for I have used both. One summer I transferred 75 colonies, and as a general thing I used neither string nor wire. I just crowded in pieces of combs around the edges to wedge the comb into place. When that was not practicable I used one strand of string, going around the frame two or three times, and tying in a bow-knot. If I did not happen to think to go around and pull out the string the bees would save me that trouble and carry it out of the hive bit by bit. If I did think, all I had to do was to pull out the bow-knot and slowly draw out the string without removing a single frame.—Ed.]

THE *Rocky Mountain Bee Journal* says, "The wide-awake, reading specialist puts on the second super as soon as work has well begun in the first; a third is soon added, and then four and sometimes five." Replying in *Lone Star Apiarist*, L. E. Kerr says, speaking of tiering up supers, "In other than expert hands it is a most dangerous procedure, where honey is the

object," and "Usually it is not practicable to tier up more than three high." Perhaps each one is right for his own locality. While it might be dangerous for a beginner in this locality to tier up, it would very often be more dangerous not to tier up; and if I should be limited to three supers in a good season I'd lose honey. [A plan of tiering up that would be perfectly practicable in Colorado might not be so in other localities. When one tiers up to any great extent he must figure pretty closely on the duration of the honey-flow. If one has, say, three or four supers in various stages of completion, some half filled and some nearly filled, and the honey-flow suddenly stops, he is in a rather bad way. Obviously it would have been better for him to give the bees fewer supers, and made them complete what combs they had, rather than to start on a fresh batch, thus dividing their time and labor. But, very fortunately, in Colorado the bee-keeper, especially in alfalfa localities, can determine almost to a day when his honey-flow will be shut off. When alfalfa gets into bloom he knows when the mower will begin work, and he knows almost exactly when every head of alfalfa in his locality will be cut. He can, therefore, plan ahead and tier up as long as there are several days ahead of a good strong honey-flow. If he knows, for instance, there are just ten days more, he will probably put on no more supers, but compel the bees to finish up the work begun; and that finishing-up will take place just about as the honey stops. Nowhere in the world but in the alfalfa regions can one so exactly gauge the length of the honey-flow. As alfalfa is grown in Arizona, California, Utah, Idaho, and Colorado, as well as some other of the Western States, the bee-keeper in any of those localities can tier up much more excessively than we who are of the East or South.—Ed.]

I'M AFRAID, just a little, Mr. Editor, that you may swing too far on the side of cellar wintering. Notwithstanding my failure at outdoor wintering, I have a suspicion that, if I knew enough, I might succeed even in this windy region; and I also have a suspicion that bees wintered out are hardier. Why they should be hardier I don't know, unless it be on account of purer air and the chance to fly whenever it is warm enough. Yet if you can manage to have a constant supply of pure air in the cellar, and if it will do to take them out on a warm day and then return them, it is possible they may be as hardy as those wintered out. For I suspect that severe cold weakens rather than strengthens. [I am satisfied that our home-apery locality has been almost ideal for outdoor wintering. Those closely intertwined evergreens that outskirt the yard have been giving a greater protection than one would suppose, and the results have been better than that secured on the average for outdoor bees. At our out-yard there were no windbreaks, and the north wind had a clean sweep. Here we tried our reg-

ular chaff hives and strong colonies. Although the bees did not die outright at this yard, the colonies were so depleted that it seemed best to bring them home and winter them in the evergreen inclosure. So I doubt very much whether, without the evergreens, a high board fence, or windbreak of some sort, we would have been able to secure such results as we have obtained from year to year. I am now satisfied of one thing: That outdoor-wintered bees should have a good windbreak around the bee-yard. It may be a barn, a high board fence, or a row of out-buildings. But it should be *something*.

But in spite of the ideal conditions at our home yard, Mr. Wardell says our cellar-wintered bees are in the lead; and this, too, in addition to the fact that the indoor bees consumed very much less stores.

But I shall not go so far as to advocate indoor wintering for every one. The latitude, the general climate, the kind of cellar that one can afford or has—all these are determining factors, and should be carefully considered. In a mild locality, or where one has naturally good windbreaks, has no bee-cellar, or at least a very poor one, I would recommend the outdoor plan; and in almost any locality a poor bee-cellar—one that is too small—would be much worse than good outdoor wintering on summer stands.—Ed.]

Mourn for the score of thousands, burned
Beneath old Vulcan's blast;
Saint Pierre is sunk in one dread heap,
In one cremation vast.

"The Dissected Bee" is the title of a new book that has just been published in Milan, Italy, and written by Mr. Alessandro Benussi-Bossi. As an illustrated volume on the anatomy of the bee it is quite unique. There are 89 pictures in it, each showing the field of view as seen in a large microscope. Let the reader imagine that he is looking at a bright disk four inches in diameter, and that on this surface there is seen the compound eye of a bee, or a foot or a wing, or some other part. This view is then photographed and reproduced in half tone, giving the reader a very good representation of a bee as viewed by the microscopist. The pictures are described in Italian, French, and English. It is a great pity that the wording of the latter language was not the work of Dr. Miller, Mr. Dant, or Prof. Cook; for as it is, it is certainly the strangest attempt in that line I have ever seen; and when we add to the wording the further attack of the Italian printers on what ought to be good English typography our regret is the deeper. But laying all that aside the author has given

to the world something of great value in the scientific line. The book has 373 pages, the size of this, and is printed on the best paper I ever saw in a book. The press-work is No. 1. The price is marked as 12 francs, or about \$2.25. I do not believe there is a bee-keeper in the world who will not feel that he has a treasure if he gets this work. In one place the author says the sting of a bee is used to inject a small quantity of bee-poison into a cell of honey just before it is sealed over. Can or do bees secrete that much of so concentrated a liquid as that? Dr. Miller may answer if he can.

The same author has also just published "The Art of Cultivating the Bee." It is entirely in Italian, and contains 336 pages the size of this. It seems to be quite abreast with the times, but has practically no cuts.

BEES AND FRUITS.

A French writer says: "The seeds of the basswood contain an oil the excellence of which was known more than a century ago, but which has been but little used. The seeds can be gathered in abundance under the trees. They fall in autumn, and contain 58 per cent of an oil noticeable for its clear color and delicate taste, with no trace of bitterness, and having no special smell. It may be compared to the best olive oil, and possesses the valuable quality of never becoming rancid. It is good as an article of food and for mechanical purposes, as it keeps perfectly.

Two of the principal journals of Paris having made a great ado under the title of "Killed by the bee," a French bee-keepers' society investigated the matter and makes the following report, the substance of which I translate:

On the 6th of March, about 10 in the morning, Mr. Boiveau proceeded to secure the contents of a straw hive. Not being furnished with a veil he received during that operation not to exceed three stings, two on the neck and one on the hand. He did not suffer enough to create any fear, and he took his dinner with his family. A little later, feeling uneasy, he retired, while his family resumed their work in the field. About two hours later his sickness increased. Mr. Boiveau arose, called his neighbors to his help, and almost immediately breathed his last. He had been ill for some time, not being able to follow any hard work, and was, besides, very fleshy, his blood being in a bad condition. It is the opinion of his family as well as of his neighbors that he did not die from the effect of the stings, but that the few stings he received simply hastened on what was very near; or, as they put it, it was the last drop of water that caused the vase to run over.

The editor well adds:

Thus falls to naught this terrible accusation. But how many have read it who have not read the explanation?

BRITISH BEE JOURNAL.

Concerning the effect of bee-stings as a preventive of contagious diseases, a correspondent has the following to say:

In reply to your correspondent "Formalin," Do bee-stings protect one from infection? I should say this opens up a most interesting subject, and I should be pleased to see replies from bee-keepers generally. I can sincerely say that, since I have been "inoculated"

by bee-stings, I have neither been attacked with influenza nor suffered from any contagious disease, though influenza has twice been through the house, excepting my boy, five years old, and he has been stung many times almost ever since he could first toddle. He has also been entirely free from all children's complaints. I have not been revaccinated myself, but my little boy was when over four years old, and the four inoculated places "took" well, with not much inflammation, and he suffered but little from the result. I have asked several neighboring bee-keepers their opinion on the subject, and they join unitedly in saying they have never had any infectious disease, nor been in any way inconvenienced when revaccinated. Until suggested by "Formalin" I did not attribute this exemption to inoculation by bee-stings, though previously I suffered a good deal from rheumatism.

It is stated by what seems to be good authority that wasps are subject to foul brood, *bacillus alvei* having been found in their nests. It is feared this will be a new agency for scattering that disease.

AMERICAN BEE JOURNAL.

The following gives us reason to expect something interesting concerning honey adulteration before many days:

"Mr. Wm. A. Selser, wife, and daughter, stopped off in Chicago, for a few hours, while passing through on their way East recently. They had been away from home for nearly three months, having been in Texas, California, Colorado, etc. Mr. Selser was representing the Government in its investigation of honey analyses, he going out to secure samples of various kinds of honey in different parts of the country. His report will likely be made in about a month to Prof. H. W. Wiley, at Washington."

PART EMPTY FRAMES, AND PART FRAMES WITH COMBS OF BROOD AND HONEY WHEN HIVING SWARMS.

"Mr. Doolittle, I think my bees are going to swarm soon, and I wish to know how I can best manage in hiving them."

"What do you mean—the *modus operandi* of hiving swarms?"

"No, not that. How would it work, by way of contracting the brood-chamber, so to speak, to take two or three frames containing pollen, sealed brood, and honey, from the colonies not strong enough to swarm, and put these in the hive, near the sides, in hiving a swarm, instead of using division-boards, the center of the hive being filled with empty frames or frames with starters?"

"What would be gained by so doing?"

"This would save the trouble of looking over the hive and taking out the division-boards later on, and giving the bees a start at housekeeping also."

"I think I have seen some such plan as this recommended in some paper of the past, but I am opposed to such a method of procedure."

"Why?"

"As I consider it, there are three things against it; the first of which is, that the

bees would be likely to fill these combs with honey as soon as the brood emerged from them, thus giving the three combs solid with honey instead of having that much honey in the sections, thus thwarting the only purpose of contraction, which is, to secure the first and best quality of honey in the sections, and also to entice the bees to work in the sections before they commence to store honey in the brood-chamber to any extent."

"Then you do not think these combs would take the place of dummies?"

"No. How could they? The bees, in this case, could and would store honey in those cells as fast as the brood emerged, while with the dummies none could be stored, for they simply take up space. Then, again, this would be rather a method of expansion, for the bees would have to spread out over these combs to keep the brood warm, so few could get into the sections while the dummies simply take up space, the bees not having any desire to hang around the outside of them."

"I think I see that part. But what is the second thing against it?"

"If the combs had any amount of sealed brood in them, so that the emerging of this brood materially strengthened the swarm, it would be very likely to result in swarming, or the issuing of 'virgin swarms,' as they are called, where a swarm of the present season casts a swarm."

"Could not these swarms be returned?"

"The returning of them does little good, for, as a rule, they are much more persistent in continued swarming to the end of the honey-flow than is an old colony; and this persistency always destroys the prospect of a good yield of section honey. I have often had swarms go to work with a will in a large number of sections, working till they were about two-thirds completed, and then, just as I was priding myself on having a large lot of beautiful honey from such new swarm, they would swarm, and be so persistent in swarming that none of said sections would be fully completed, while the nice looks of the work they had begun would be spoiled through the long failure of its completion."

"Well, that does not look encouraging, surely. I had not thought that this brood would cause them to swarm. My idea was to help boom the section honey by adding bees to the swarm by way of the emerging brood. But while we are talking, give us the third reason you have against my plan."

"The third is what will be the greatest trouble of all."

"What! something worse than you have been speaking about?"

"Yes. The main trouble with such a plan of working lies in the persistency of new swarms in building drone comb in the remaining part of the hive, where any part of it is supplied with any thing in the shape of frames filled with comb."

"Why do they do this?"

"The *why* of this is something I could

never fully understand; but an experience of more than thirty years along this line has proven to me that bees can not be depended on to build worker comb during the first week after being hived, if there is any completed comb in the hive at the time of hiving a prime swarm, more than what little is necessary to use as starters along the top-bars to the frames, where starters of comb are used in preference to comb foundation, as some think better."

"Why do you say *prime* swarms?"

"With second or third swarms the case is different, as bees are more apt to build worker comb with a young queen when she first commences to lay, and only unfertile queens accompany these latter swarms; and in this case the queen does not commence to lay till the bees are fully accustomed to their surroundings, and they build but very little comb, where any combs are put in the hive, till their queen commences to lay. And when she does begin to lay she crowds the comb with eggs as fast as built, thus helping also the matter of building worker comb. Then the prime swarm has a much larger force of bees; and, while she is hanging about the frames of comb and brood given, depositing her first few eggs there, the bees are building comb rapidly; and as they see no necessity for building worker combs to be occupied with honey, they go to building combs for the storing of honey, which generally are of the drone size of cells."

"Is this kept up till the hive is filled?"

"No, not unless the queen is very old or very poor. After the bees have built what would amount to two or three frames of drone comb, and the queen recovers her normal egg-laying powers which she had before the swarm issued, then the bees go on and build worker comb; but we have worker and drone comb all mixed through the frames, which is a condition an enterprising apiarist does not like, one which should never be tolerated by any would-be bee-keeper, even, and one which, if allowed to remain, results in a diminished crop of honey each year as long as the combs are allowed to remain in this shape."

"What would be your advice then?"

"My advice to all is, and has been ever since comb foundation came into use, to use only starters in the frames in hiving swarms, or else fill all frames with foundation, or give all frames filled with comb. And I believe this is good advice too."

"Why not use part frames of comb and part frames of foundation?"

"Frames filled with foundation, mixed with those containing combs, do much better than frames having only starters when used with combs; but even this is objectionable on account of the bees lengthening the cells on the combs given while they are working out the foundation, so that the combs along the top-bars to the frames will be very thick when completed, while those with foundation are correspondingly thin. But I have some work I must go at now."

In a late issue I gave the text of the new anti-adulteration law that is now in force throughout New York. From recent clippings that have been sent, it is apparent that the glucose-mixers are hunting their holes, and that the retailers are trying to get rid of their so-called "pure" honey. Good! Ohio, Illinois, and New York, each of which has big cities, have laws that will stop the adulteration of honey. Let the good work go on.

THE iniquitous sweet-clover bill that was introduced in the Ohio Legislature has been killed, and killed so dead that I hope no succeeding legislature will try to pass another measure like it. This only illustrates that bee-keepers, when they are united, and write to the members of their legislature, can exert a powerful influence. If it had not been for the bee-keepers of New York the new anti-adulteration honey law would not have been passed.

NATIONAL HONEY STATISTICS.

HERE is a resolution that, as will be seen by the date, was sent in some time ago, but which I overlooked. I will now place it before our readers, and suggest that the Board of Directors of the National Bee-keepers' Association take this matter under consideration.

RESOLUTION PASSED AT THE ONTARIO CO., N. Y., BEE-KEEPERS' MEETING AND INSTITUTE, CANANDAIGUA, N. Y., DEC. 13, 1901.

Resolved, That it is the sense of this convention that the officers of the National Bee-keepers' Association should establish a system for gathering and reporting monthly, during the honey harvest, the comparative yield of honey up to date of said report, and that we request them to do so; also,

Resolved, That copies of this resolution be sent to, etc.

W. F. MARKS,
E. H. PERRY,
H. C. ROAT.
Com. on Resolutions.

THE BIG NATIONAL CONVENTION AT DENVER.

FROM various newspaper clippings that have been sent to us, it is apparent to me, at least, that the bee-keepers of Denver are making preparations to entertain the members of the National Bee-keepers' Association in a way that was never attempted before by any other body of bee-keepers in the United States. I verily believe that our next convention, at Denver, during the first week in September, will be the greatest ever known in the history of the Association. Denver is central, even if it is so far west to us Easterners. It is also right in the heart of one of the best honey localities in the world; and that locality, good as it is, is right in the heart of the great West, where in the future at least three pounds out of five of the honey of the United States will be produced.

"KELLOGG'S PURE HONEY."

THE people who are putting out "Kellogg's Pure Honey," purporting to come from Medina, are beginning to send these goods out again. As I have before told our readers, no such honey bearing that brand is put up anywhere in Medina, and all the samples of these goods we have had analyzed were the vilest of glucose. Of all the bad decoctions masquerading under an honest name purporting to come from an honest town this is by far the worst I ever saw. Medina is a village of only about 2000 inhabitants. We know every business concern in town; and if Kellogg honey were put up here we should certainly know it. The fact is, it is put out by a Kansas City firm who are trying to trade on our good name. They know that any thing that comes from Medina in the bee line is supposed to come from the Roots. They know that we are fighting adulteration; they know, also, that the general public knows it; therefore any thing hailing from Medina they suppose will be considered as pure goods, and that is true.

We warned the concern putting out this stuff, and they desisted for a time. We are now gathering fresh evidence to put in the hands of our attorney; as we intend to bring suit we solicit the aid of our readers.

If you can, learn from your grocer who it is that puts out these goods. Obtain, if you possibly can, a certified copy of a bill—or, better still, obtain the original bill itself of this Medina (?) honey.

Later.—Since the foregoing was in type I learn that the State Food Inspector of Idaho, where this stuff has been sent, is looking after this Kellogg honey; and he says if he finds it adulterated, every bottle of it will be condemned and ordered out of the State. If the goods are like what we have seen and tested they will be barred from the State, sure.

BEE STORIES IN MAGAZINES; HOW TO GET SOME GOOD ADVERTISING FREE.

BEE stories and facts about bees are getting to be quite a fad in the illustrated papers and magazines of late. The *Youths' Companion* recently had a very nice picture on its first page, showing a modern apiary of 8-frame Langstroth hives, and a beautiful girl in the foreground on whom a swarm of bees was clustering. The story is quite tragic. It relates how the girl almost swooned, but kept still without flinching until her uncle, a bee-keeper, hived the bees off from her. Too bad it wasn't her sweetheart! What was almost a tragedy would have ended in a beautiful romance.

Another interesting bee story appears in *Ainslee's Illustrated Magazine*.

All these stories and write-ups are very helpful, because the general public are now beginning to get a glimpse of how honey can be produced in such immense quantities. When consumers generally under-

stand just how comb honey is "manufactured" by bees in the hives, and that the beautiful little combs they see in the boxes on the market are real bee honey, we shall begin to see an advance in the price of our product.

Now, brother bee-keeper, every time you can get hold of a reporter invite him to your bee-yard and show him how you handle bees. Mayhap he will give you a nice little advertisement; for to be known in any locality as "the bee-man who produces real bee honey" is worth something. Then when you are around selling your product your prospective customer will say, "Oh, yes! this is Mr. Jones whom I read about. Yes, I'll take some of that nice bee honey."

STAHL AND HIS SPRAYING CIRCULARS.

It will be remembered that Mr. Wm. Stahl, of Quincy, Ill., manufacturer of spraying-outfits, is sending out circulars broadcast all over the country, advising the spraying of fruit-trees while in bloom. These circulars have a string of testimonials without date, saying that spraying in bloom is beneficial. Notwithstanding some of the agricultural papers (no way interested in bee-keeping) have told Stahl that his teaching was contrary to the advice of all of our experiment stations, he persists in his course in sending out those same circulars all the more.

Some two or three years ago the experiment stations at Ithaca and Geneva, N. Y., made quite an elaborate series of experiments in spraying one set of trees while in bloom and another set before and after bloom. The result of all these experiments showed conclusively that the latter plan was much the more preferable. More and better fruit matured; and it was shown, also, that many of the spraying-liquids had a decidedly injurious effect on the delicate organs of the blossoms.

Very recently, N. O. Booth, assistant in horticulture at the Missouri State University, has prepared a bulletin giving general directions what, when, and how to spray. He says very emphatically that the spraying should be administered *before* and *after* blooming, and this is the advice that *all* the experts give.

We have just come in possession of a letter sent to one of Mr. Stahl's customers, who, having followed his advice to spray while in bloom, found that, so far from giving beneficial results, it was decidedly injurious. This is what Mr. J. M. Fay, the party referred to, wrote to Mr. Stahl himself, and is right in line with the experiment stations all over the United States:

Wm Stahl, Esq., Quincy, Ill., Dear Sir:—About one year ago I purchased a spraying-outfit from you; also received your private instructions on spraying, which instructed me to spray fruit-trees when in full bloom. Some of my early varieties had mostly got through blooming when the spraying-outfit arrived; but the later varieties were in full bloom, and this spraying was done according to instructions, except a few trees which were not sprayed at this time, because the mixture I had on hand ran out and I did not have enough to complete the work, which was done later, but not

before the blossoms had all fallen off. Now, what I wish to say is, the advice you gave me in the instructions you sent me, to spray in full bloom, is all *wrong*, and was very unsatisfactory to me; for on the trees I sprayed in full bloom, the application at this time *killed* and destroyed all the best fruit by its falling off, and the trees next to the ones sprayed in full bloom, that were sprayed later, after all blossoms had fallen off, gave a third more fruit and a fourth larger in size. So you see that recommending to spray in full bloom must injure *your* business as well as do a *great* damage to the innocent by following your advice. I write you this so you may not injure others in this way.

Very respectfully, J. M. FAY.

Detroit, Mich., April 26.

Of course, Mr. Stahl will never give *this* letter publicity in his circulars, for it is not to his way of thinking; and I venture to say he has received a good many like it; but this is the only copy that has so far been placed in my hands. There are plenty of careless observers who, having never made any *comparative* experiments, would conclude that spraying during blooming would be beneficial; and I do not suppose there is any doubt that spraying, even during blooming, would result in a better crop than without spraying. While it would certainly cut down the quantity of fruit, injure some of it, and kill bees, it would probably destroy some of the enemies that would injure even more than the spraying. A string of testimonials saying that spraying during bloom is beneficial, such as Mr. Stahl is sending out, does not prove any thing.

The advice that this man is sending out broadcast over the country is doing a fearful damage to the bee-keeping industry. Every spring after the spraying season we get reports showing that quantities of young brood are poisoned, and this comes just at a time when it can be least afforded. And not only is brood killed but bees are destroyed by the thousands. The effect of this is to cut down the honey crop by one-half. If there is any law that can stop a man from using the United States mails for the purpose of propagating heresy that is damaging to a large industry, the National Bee-keepers' Association will see to it that it is enforced. The A. I. Root Co. will help raise a fund, if the \$1000 to the credit of the Association is not large enough to prosecute.

Another manufacturer of spraying-outfits who had been advising to spray during blooming time, as soon as he had been informed of his error immediately recalled his advice, and now sends out directions in accordance with the experiment stations.

THE LATEST FROM THE PEAR-BLIGHT FIELD IN CALIFORNIA.

N. W. MOTHERAL, of Hanford, Cal., has been one of the principal persons in that district to stir up feeling against the bee-keepers. When I came on the scene there as an officer of the National Bee-keepers' Association he thought I was going to bluff and bluster, and immediately began to inform me, before I had a chance to say any thing, what they, the pear-men, were going to do; and among other things he intimated that, if we didn't get the bees out, they

would poison them. And there were two or three others who were disposed to get into a hot argument. But argument, under such circumstances, never accomplishes much. I listened to what they had to say; then after talking with them a little I left them fairly good-natured—so much so that Mr. Motheral came out in one of the papers with a statement to the effect that I was quite a decent sort of chap, even if I was one of those bee-men. In the mean time it appears that Mr. Motheral has become sour again, and is in for a fight, judging from what I can hear from the local bee-keepers. (Say, can't you bee-men sweeten him up again?)

It will be remembered that an agreement was made between the bee-keepers and the fruit-men that a certain district about two miles square should be cleared of bees. This was done, and in the mean time certain experiments are being conducted by which whole limbs and whole trees are covered with mosquito-netting. In the *Hanford Journal* of April 19th Mr. Motheral comes out with the statement that all the Bartlett trees in his orchard that were not protected by mosquito-netting were affected by blight; that those trees that were covered were not affected; that, further, in Mr. Charles Downing's orchard, he understands, where these experiments were conducted on a larger scale, the same results were seen.

Mr. F. E. Brown, Secretary of the Central California Bee-keepers' Association, immediately made an investigation, and reported his findings in the *Hanford Sentinel*. He visited, he says, the Downing orchards and several others in that vicinity. True enough, several of the large trees were protected by the netting so that no bees could get at the blossoms; "but contrary," he says, "to the report of Mr. Motheral, there was plenty of blight; however, not so much as on the trees uncovered; yet the difference is not so great, and there is no more fruit upon these trees than on the trees not protected. The reason is, the fruit was not pollenized, and the blossom with the stem attached dropped off."

Prof. M. B. Waite, of the Department of Agriculture, who read a paper before the joint session of the National Bee-keepers' Association and the American Pomological Society, at Buffalo, admitted that, while bees might scatter pear-blight, other insects besides bees could carry the infection; but that, as most of our pears are sterile to their own pollen, and that this was especially true of the Bartlett pear, insects were necessary for mingling the pollen. "In California," he said, "they have had such outbreaks of pear-blight that many thought they can dispense with the services of the bees in this way, that the Bartlett pears would set all their fruit, if necessary, without the visits of the insects." But he seemed to be doubtful whether, even if the bees did scatter the virus, the pear-growers could afford to dispense with the bees.

If what Prof. Waite says is true, then it

appears that Mr. Motheral, one who seems to be the chief accuser of the bees, is mistaken; and if covering up the trees so that not a single bee can get to them does not prevent pear-blight infection, it would look as if the removal of the bees would in no way affect the result any more than, *perhaps*, it would diminish slightly the amount of the blight. But the decrease in the blight would be more than offset in the lesser quantity of fruit set, as the bees, nature's pollinators, would, if the pear-men could have their way, be absent.

GOVERNMENT APICULTURAL WORK.

Dr. Miller's Attitude toward it; the Introduction of New Stock.

BY DR. C. C. MILLER.

Prof. Benton, page 372, seems to think I justly deserve "the severest criticism which due courtesy will permit." After reading his article through, it hardly seems to me he has taken much account of courtesy, due or undue. In his report, Mr. Greiner made the statement quoted by Prof. Benton, "It was believed," etc., and it is a common thing to understand that as meaning "It was believed by the convention." I so understood it, and had no idea that I was misquoting. I am sorry that I did not quote literally, so there could be no possible misunderstanding, and for not doing so I ask pardon of Secretary Greiner and the Ontario Co. Association. It may be a question, however, whether my understanding of the matter does not come nearer the truth than does Prof. Benton's. I understood that the general view at the convention was that it was better for government to spend money to advance control of mating than to spend it on importing foreign queens. Prof. Benton intimates that this was the view of "some member or two or three members." Mr. Greiner says: "While the Association did not take action on this proposition, still, the matter was brought up again by another member, showing that it had gotten a hold. Undoubtedly it will be pushed on at some future time." Is it likely Mr. Greiner would take the trouble to say, "it had gotten a hold," if at most it had gotten hold of only three members? Would he say, "Undoubtedly it will be pushed on at some future time" unless he thought the majority of the Association would favor it?

Prof. Benton says I seem ready to throw cold water on any work in the bee line that the government might sanction. In that he surely is mistaken. I do not know of a single instance in which I threw cold water on any work in the bee line that government

sanctioned. As Prof. Benton says I seem so ready to throw cold water on such work, he probably imagines that there have been a number of such instances. When making such a charge in so public a manner, is it not "due courtesy" to be specific enough to name the instances, or at least one of them? Will Prof. Benton please do so?

I am glad to be able to say that I think there is a little excuse for Prof. Benton's mistaken idea. In the *Stray Straw* in question, when I spoke of the convention now talking as I had talked, I had in mind the matter of the introduction of *apis dorsata*, a matter, so far as I know, that had not the sanction of government. I imagine that Prof. Benton thought that I had in mind the work actually done by government lately in introducing queens from new regions of Italy, etc. Moreover, I *now* think that the convention had in mind this actual work of the government, and had *no thought* of *apis dorsata*.

The question may be asked why I did not think of the work that Prof. Benton had done in introducing the queens mentioned. For the simple reason that not until four weeks after that *Straw* was in print did I learn that such work had been done, and then I learned it through a *private source*. Due courtesy forbids that I should criticise Prof. Benton in this regard; but I hardly think it will be discourteous to say that bee-keepers would be grateful if he would keep them informed through the bee journals as to what he is doing; and that if he had taken a page of *GLEANINGS* to tell all about the importations he had lately been making it would have been, at least for some, more interesting reading than to have had the same space occupied in berating me. And in this case it might have saved some misunderstanding on both sides.

Prof. Benton says I have done nothing toward securing appropriations from government. Is that such a capital offense as to need three lines of italics in the telling? If so, why am I signaled out to be gibbeted, when in the same sentence he practically says that the entire bee-keeping fraternity, with a slight exception, are equally guilty? for he says that what has been done has been done "almost single-handed." But if I have been negligent in that respect, I seem to have done my full duty in another respect, for he credits me with "a bushel or two of propositions" as to what I might think best should be done.

Possibly he may not be entirely correct in either regard. At any rate I do not desire undue credit in the "proposition" line, and I am a little curious to know what I have proposed.

I am sorry that Prof. Benton wrote the paragraph referring to the Albany convention in such a way that it may be understood as referring to me. I was not at that convention, and had nothing to do with the matter he mentions.

Some of the new members of the *GLEANINGS* family may ask the question, "What

is all this about, anyhow?" It is only fair that I should reply in a few words. There is a big bee in India, *apis dorsata*, that some of the bee-keepers wanted brought to this country. Along with some others I opposed its introduction until it was learned whether it could be controlled, for there were reports that it was migratory and would not be confined to a hive, and it was feared it might be a case somewhat like the introduction of the English sparrow. Among those in favor of the introduction were some of the Ontario Co. bee-keepers, if I am not mistaken; and when I understood that such introduction was opposed at the late convention I thought the joke was on them, and that they would take my reference to it as good-naturedly as I intended it, for I consider the bee-keepers of Ontario Co. good-natured as well as intelligent. Knowing nothing about the late introduction of queens by the government (which I may say, by the way, could meet only my hearty approval), it can easily be seen why I supposed the reference was to *apis dorsata*. The probability is that Prof. Benton thought I was speaking against the work he has done, hence his article.

When he understands the matter fully I am sure that he will have the courtesy to absolve me from all blame. There is enough fighting to do against enemies to the pursuit without having any quarreling within our own ranks. Prof. Benton has my thanks, and should have the thanks of all, for making an effort, and a successful effort, to have increased recognition from government; and he should also have thanks for all that he has done in the interest of the pursuit. He may always count on my hearty co-operation in any good that may be done.

Marengo, Ill.

IMPORTATION OF HONEY-BEES.

Basswood Timber for Top-bars; Comb-honey Canard.

BY F. GREINER.

Mr. Editor:—In order to understand fully what was meant when saying, "What money our government expends importing bees might better be used otherwise" (see Dr. Miller's *Straw*, page 275), allow me to define my position.

For more than 30 years we have been importing bees quite largely from Italy. There existed a good reason for doing so, and paying many thousands of dollars to the queen-breeders of Italy. After testing the Italian bee for these many years here, the American bee-keepers have come to the conclusion that this bee is well adapted to our widely varying climates. The majority of honey-producers have it in their yards, and propagate it.

The American people in general have the name of being the most practical business men, and deservedly so. We may, there-

fore, infer that they will use their business faculties in breeding bees as well as in other lines of business. I have as much faith in our *own* queen-breeders as in those of foreign lands—nay, even more; and I do believe they will produce bees superior to those in Italy. It may be that Italy has a slight advantage as to pure mating; but it is also true that, in many localities here, the Italian bee is sufficiently in the majority, so that but few queens are even mis-mated. It seems to me the time has now come when we can with profit to ourselves stop further importation of this bee. If we would spend what money we send to Italy in improving the bee we now have, we should make advances faster, and be ahead in the end.

We have also imported quite a few Carniolan bees during the past two decades, and in a few selected localities the breeding may be carried on quite successfully. We might, therefore, dispense with further importations of this bee, and put money into our own breeders' pockets.

As to other races of bees, the matter is different unless we are all agreed that there were no others worthy of our attention. This, however, is not to be expected in the near future. What Dr. Miller has previously said relative to importing bees and discouraging it, had reference to *apis dorsata* only, or I am mistaken. I don't think he included either Italian or Carniolan bees. If he did, then I indorse that part of it. It may not bring us any gain to bother with the big Indian bee. I don't think it will myself; but there are many others who think it may, and for this reason I am not opposed to making some effort to investigate the matter.

Before I close my communication I wish to say a few words on the lately brought-up question, basswood versus pine for top-bars. Mr. Root, when I hear a man recommend a thing which I have found utterly wanting, or make statements of so-called facts which are not facts at all, it naturally weakens my confidence in that man. This reminds me of the statement a visitor at our bee-keepers' meeting made last winter. He said his colonies came out of the winter with 16 or 18 lbs. of bees to the hive. It is true, I have not weighed bees at that time of the year; but I have at other times, and I should say any colony having 5 lbs. of bees April 15, in my locality, is a very good one and worth the money. No, I did not believe that statement. Our good visitor surely made a big mistake. To recommend basswood for top-bars is a case similar to the above. I have tried basswood only once, and have been sorry for it ever since. Wax-moth larvæ may bore into pine and not into basswood. I confess I have not observed it. But what of it? How many top-bars are injured in this fashion? Not one in a hundred, except, perhaps, where quilts are used the year round. Then why use basswood, that will warp and twist all out of shape? I am not pre-

pared to say basswood top-bars will warp *out of the hive*, as some one has said; but I am sure you will wish it did if you ever use it.

To create greater confidence in our product, both extracted and comb honey, I wanted to say a good while ago that stamping each section and labeling every package of extracted honey, giving name and place of the producer, will have a beneficial effect, as I know from experience. Bee-keepers who have some influence with the newspapers of the large cities could do a great deal of good by writing suitable articles for these papers. What appears in apicultural and agricultural papers I am afraid will not reach that class of men we need to reach most.

Mr. Stahl, the originator of the last comb-honey canard, has not made any retraction so far as I know. He probably has not yet fully recovered from his Rip Van Winkle sleep, has not yet realized that the honey of the present day is not like that of his forefathers stored in old black comb, with bee-bread interspersed, and having a perceptible odor of brimstone. He may have acquired a liking for such stuff, which would explain that our virgin comb, snowy white, and melting in the month, aromatic, and beautiful to behold, does not find favor with him.

Naples, N. Y., April 10.

[Dr. Miller has an article in this issue which explains just what he did think—that he had in mind *apis dorsata* and not other races of bees. It appears that you understood him correctly while Prof. Benton seems to have read him wrongly.]

With regard to the use of basswood *inside* of hives, much depends on the locality; but I should say, generally, that a basswood top-bar would not be as good as one of pine. Indeed, the Root Co., so far as I know or recall, has never used basswood for top-bars to brood frames. There is hardly any thing better for hives, inside or outside, than ordinary white pine. But, unfortunately, this wood is getting to be very scarce; and the time may come when bee-keepers in this locality will, on the grounds of economy, have to use some other timber—possibly whitewood, cottonwood, or poplar. All of these woods are nearly alike, varying somewhat according to the locality. Basswood will probably be as scarce as pine, and I should not be surprised if, twenty years hence, we had to get our lumber from California; and if the railroad companies charge exorbitant freight rates, as they do now, we might be very glad to have all parts of our hives made of hard wood; but no hard wood will stand the weather as well as good white pine. As it is, a very large portion—probably the most—of our white pine we use now comes from Canada. The Michigan pine is practically gone.—Ed.]

Since the foregoing was in type the following has come to hand:

Dear Mr. Root:—I find that our Ontario County, N. Y., bee-keepers are very much displeased with the version Dr. Miller reads into my report given in *American Bee Journal* of March 6, 1902. In addition to what I wrote in a previous letter I wish to say that I did not intend to convey the idea that what I had said at the convention regarding the importation of foreign bees was to represent the sentiment of the Association, but simply that of the speaker. As I re-read my report in the *American Bee Journal* it does look as though I meant it otherwise. However, it seems Mr. Benton understood it. FRIEDEMANN GREINER.

Naples, N. Y., May 6.

[Dr. Miller's reply to Prof. Benton will make his position clear.—ED.]

NUCLEI MANAGEMENT.

The Swarthmore System any thing but a Success; an Experience.

BY QUEEN-BREEDER.

Continued from April 15th issue.

To insure the safe return of the queens I secured a number of wooden paint-tags, each of different color, and fastened one under each flight-hole for an alighting-board. This was contrary to Swarthmore, who claims, I think, that a queen pays no attention to color or shape, but is guided solely by the little cluster of bees awaiting her return; but it was in accord with E. R. Root, who claims that both color and shape are essential in guiding the queen. Certainly the latter plan can do no harm, and so I use it.

I have now 40 frames on stakes set 4 feet apart in rectangular form, each containing 8 queens, or 320 in all. The next day after opening the flight-holes, drones were flying freely, and I was on the lookout for queens. Standing inside, and at one end of the rectangular space, I was able to get a good view, and I shortly saw a queen emerge from a box only a few feet from me, and, after a short turn or two, she was lost to view. While awaiting her return, three others came out from the same frame and took their flight. In about ten minutes, what I supposed to be the first queen out returned, but without any evidence of having met the drone. This queen hovered around the entrances of several boxes, and attempted to enter, but was repulsed by the bees, frequently dropping into the grass, and then renewing the attempt with the same result. Finally I picked her up, and, placing her at the proper entrance, she ran in at once.

Other queens were now issuing from different parts of the apiary. Of course, I found it impossible to watch all of these at once, so I confined my observations to the frame first noted. All around this frame queens were circling, and some were trying to enter, and this I found to be true of the

other frames generally. Soon a queen that had evidently met the drone returned to the frame in question, and, after attempting several entrances, entered what was probably the right one. This I marked for future reference, together with several others later on. I was surprised at the difficulty shown by returning queens in finding the proper entrances, and I am convinced that many queens are lost in this way.

The next step is a search for eggs, which one might reasonably expect to find in a day or two, or within a week if the queen is all right.

Now, right here is another one of those perplexing points of practice—not explained by Swarthmore—which makes one feel like giving up the whole thing in disgust. Swarthmore says, "Examination for eggs may be made through the backmost holes," etc. It must be borne in mind that each one of these little nucleus-boxes has been already filled with eggs, honey, etc.; and when the backmost holes are opened, nearly every available cell (not containing bee-bread or honey) will be occupied by this time with quite a fair-sized larva. Now you see what a predicament one is in. What shall—what *can*—be done? I might wait for the bees to remove the larva and thus make room for the new eggs; but would they do it? Probably not, and the experiment is too hazardous. I might remove the cover of each nucleus, and with a pin remove the larva; but this would require time and fussing, and disturb the queens, and result in loss, no doubt. I finally take 320 empty section boxes and fit a piece of drawn-out comb inside each one, and on one side I place a cover taken from a nucleus-box on the side opposite the flight-hole, and these section boxes are then fitted by a clamp to each nucleus-box, on the side opposite the flight-hole, so that I then had two combs instead of one in each nucleus. This arrangement solved the difficulty, and gave room for laying eggs.

In due time I found, by examination, eggs deposited in about 200 boxes, which I marked for convenience. The remaining boxes were, many of them, queenless, and others with queens evidently not fertilized. I gave virgins to the former, and awaited developments with the latter.

Of the 200 boxes containing eggs, I supplied 100 with queen-cards, to be kept until the brood hatched for warranted queens, etc. I had some orders for untested queens to be filled in a short time, and congratulated myself on having the other 100 queens to apply; but, alas!

The best-laid plans of mice and men gang aft agley, And leave us naught but fear and pain for promised joy.

Well, I went to these little colonies, expecting, of course, to find in each a fine healthy queen. Out of the 100 I took 27 queens, all that could be found. The remaining 73 were queenless, and many with queen-cells in various stages of construction. Here was a direct loss of 73 queens.

This experience made me fearful of results, and led me to make some careful observations. I found that the bees that collected around one flight-hole had a habit of running over to a neighboring flight-hole, and, to my surprise, they were, as a rule, well received, and went in and out, and seemed in a way to make themselves at home. I tried to prevent this by surrounding the flight-holes with section boxes, but without effect. I believe this visiting habit was one cause of the loss of queens. Further inspection showed that, in some cases, even fertile queens left the colony, and, after circling, returned in some instances to the proper colony, but oftener to the wrong one. I now very carefully examined the 100 nuclei designed for warranted and tested queens, etc., and found evidences of queenlessness in a large number, which, upon examination, proved that at least 60 per cent were queenless. These queenless colonies I supplied with virgins. The remaining 40 per cent were left until the brood had hatched, and, on inspection, 24 queens were found in good condition, while the remainder were missing, and this condition of things prevailed until I had lost more than 200 queens, when I began to reduce the number of nucleus colonies under the Swarthmore system, and unite them on four-frame nuclei.

You will remember I had quite a number of little colonies that I had supplied with virgins. These I watched, and gave careful attention, but with no better results than I have already narrated.

I will not weary you with all the details—the fussing with covers, the conditions of sunlight and shade, the shrinking and swelling of the light section boxes incident upon the changes of weather; and, later in the season, the fight with robbers and the invasion of bee-moths; the changes in temperature, hot days and cool nights, etc.; but I will say that these and many others are points of practice that are serious obstacles in the way of the Swarthmore system. I do not wish to be understood as condemning without reserve the Swarthmore system, nor as saying anything derogatory to Mr. Swarthmore, as I am bound to accept his statement in substance, that the system (in his hands) is a success.

In this article I have given you facts as they occurred in my experience in carefully carrying out the details, with what knowledge I could get from the Swarthmore article in GLEANINGS, and my own experience as a bee-keeper.

[The Swarthmore system of queen-rearing is all right, except in the matter of having the queens fertilized, and the reports regarding this part have been any thing but satisfactory. The fact is, small one-frame nuclei, not much larger than a section box, are not a success with the average person, either for the purpose of having queens fertilized or for keeping them or the bees after the wedding-flight.

Swarthmore could not have tested this feature on a very large scale or he would never have launched it on the public.—ED.]

SPRAYING TREES WHILE IN BLOOM.

What Remedy in Law Have Bee-keepers?

BY HARMON SMITH.

Mr. Editor:—Let me say a word or two about Wm. Stahl and his advice about spraying trees when in bloom. Lawyers know there is no wrong without a remedy. Any man injured by his neighbor can find a remedy, ample and sufficient. If I had a neighbor who was about to spray to my injury, the courts of equity would grant me an *injunction*, restraining him from doing so—no doubt of this, and he would have to pay the costs.

I am not so sure, but I think the law (in equity) would or could be made to apply to Mr. Stahl so as to restrain him from using the mail through which to disseminate his poisonous literature—at least this proposition is worth looking up by the National Bee keepers' Association.

We have a law in Michigan making it a criminal offense to spray trees in bloom. Let us enforce it, if we are afflicted with those following Stahl's advice. At section 5689, Howell's Compiled Laws of 1897, we read: "No such spraying shall be done while said fruit-trees or vines are in blossom," except in special exceptions. There is no special penalty attached to this prohibition, but the statutes make this a misdemeanor, and we find the punishment provided for at section 11330 *id.*, which reads: "When the performance of any act is prohibited by any statute, and no penalty for the violation of such statute is imposed, either in the same section containing such prohibition, or in any other section or statute, the doing of such act shall be deemed a misdemeanor;" then the next section makes such offense punishable "by imprisonment in jail not more than one year, or by fine not exceeding two hundred and fifty dollars, or both."

Here is our Wolverine remedy:

1. Injunction to prevent the meditated injury.
2. An action for private damages.
3. It is a criminal offense, punishable as above.

Is not this sufficient? There is no wrong without a remedy; but don't let us be in haste. Law is a very vexatious, precarious, and generally unnecessary business.

Orleans, Mich., Apr. 5.

[These are questions in law on which I am not posted, and I should be glad to hear from some of the bee-keepers of the legal fraternity as to what course could be pursued. In some States there is a direct law against spraying fruit-trees while they are in bloom. In others there is no such law. See editorials.—ED.]

RAMBLE 202.

A Visit at Guanajay; Spanish Honey; Stingless Bees; Effects of the War; Locating an Apiary; Mosquitoes; a Spanish Home.

BY RAMBLER.

Mr. Somerford and I made a sort of flying call upon Messrs. Howe, Beaver, Moe, and Hochstine; but as I am doing up Somerford now I will reserve the doing-up of the other gentlemen later—especially that lively chap Howe, who greatly defamed my qualities of endurance on page 110. I'll fix him. Before we called upon Mr. Hochstine, Mr. Somerford informed me in a confidential way that said gentleman was a great talker, and that he might give me the headache if we stopped too long, or possibly cause a fit of sickness.

I took what he said with some mental reservations, for I had discovered that Mr. S. is no small talker, and I was feeling a little queer under his administration. But when Mr. Hochstine took me to one side and informed me that Somerford had killed one man with talk, and that I should beware of him, I believed him, took the alarm, and retired to Havana, rested several days, and was then ready for another trip. I shall be under lasting obligations to Mr. Hochstine for his timely warning.

Mr. Somerford is one of those men who have a good amount of "sunshine" in their souls. As the old adage has it, "his heart is on his sleeve," and he does his thinking out loud. He may have on that old straw hat cocked up in front and down behind, a jumper and overalls the worse for honey; but when the words begin to flow, and the sunshine (smiles) begins to play, you forget all of the minor surroundings, and think only of the man behind the words. He is ready to talk and advise the humblest, and I believe he would sit down just as unconcerned before president or king.

Mr. S. believes in doing one thing, and doing it well; therefore he is in the honey business for the cash there is in it; and, as previously stated, in a large way.

In order to still enlarge the field, Christmas and the day after were spent in looking up new fields.

Christmas morning Mr. Somerford and one of his men, Mr. Faulkner, a New Jersey boy, and the Rambler, mounted wheels,

and, after a six-mile spin over the beautiful calzada, we arrived in Guanajay. Here Mr. S. had some business with the postmaster, and I was very glad he did. The postmaster is a Cuban, and also a bee-keeper in a small way, but aspires to something larger, and with American hives. Mr. S., with a ready flow of Spanish, gave him many pointers on the construction of the new hives.

It is no matter how forbidding and prison-like the exterior of a Spanish house may appear, there is always a cheerful little court in the interior. The photo gives you a glimpse of such a court. In the end next the postoffice is the family dining-table, and, using the table for a tripod, I secured the photo. Observe the tile roofs, stone floors, the house-plants, stone water-jars and barrel, and the family goat. If the owner has a horse, that is kept here too.

The most interesting object to me was that little oblong box over the further door. There were several of them hanging along under the eaves, and they contained swarms of the stingless bees of Cuba. The bee is much smaller than our common bee, and for a defense it contracts the entrance down so that one bee can barely enter. There is always one inside with its head in the entrance, ready to thrust out any intruder, and I am told that their bill is not to be despised. I hope to make a further study of this interesting bee.

Again we were off, for Quiebrahacha. Here we had our Christmas dinner with Mr. Quint, an American who is in the gardening business, and had on that day as nice tomatoes and egg-plants growing as you seldom see. One of the sad features of this island are the many ruins as a result from the long war. Here was formerly a large town of substantial stone buildings, but it was utterly destroyed—on every side, ruins; churches with wrecked walls; perhaps a bell remains in a broken tower, but it has lost its connection with the earth, and is silent. A few palm houses and a few Cubans reside in what was once the

suburbs of the town. Among the ruins Mr. Quint showed us some of his best-growing vegetables.

We were on again and to Mariel. This is a port about 25 miles west of Havana. Located here is a marine hospital; also,

THE POSTMASTER'S APIARY.

with its prow pointing into the air at an acute angle, is the Spanish war-ship Alphonso XII., sunk during the war.

I might also tell you of the pleasant evening we spent with Miss Edwards, who has about 25 orphan children in charge, and is performing a very benevolent work.

I might also tell you about a Cuban hotel where the eatables are good, but the beds are wretched, all made too short for Americans, and where the pillows are made of sawdust or something about as hard.

Well, Mariel is one of those points on the north coast where Mr. S. expects to establish an apiary, and from which to ship sloop-loads of honey.

Here we bade fare well to good roads, and took to rutty highways, cow-paths, holes in the bushes, or any old thing looking toward new and blooming honey-fields. Mr. S., being guide, set his face toward the head of Mosquito Bay. Passing a goodly acreage of honey flora, Mr. S. would shout, "There, Rambler, how does that suit you? how would you like an apiary here?"

"This may be all right, Bro. S., but here we are on a sort of a hogback, as we would say in California, and no water near. Then here are bad roads."

But not a word from Bro. S. in reply. He went plunging through the bushes on his wheel.

"See here, Rambler," again shouts Mr. S., "look awayover the hill yonder; see the grand

ocean, and see those millions of honey-plants — doesn't that beat California?"

"Pshaw! Bro. S., this is tame beside the Golden State. There, instead of a little hill, it is from ocean to roses, and then to snowclad mountains, and honey beyond the dream of avarice."

Mr. Faulkner is a very quiet young man; but he enthused here and said, "This may not beat California but it beats all I ever saw in New Jersey."

Well, after alternately riding and walking we reached the head of Mosquito Bay; and here, five miles away from anybody and everybody, we found a little palm cabin and a Cuban and his wife. He eked out a living by burning charcoal. Here Mr. S. located another apiary, and hired the Cuban to take charge of it; and he got on so well with him that he offered to take us down the bay some two miles with his flat-bottomed boat; but, of course, Mr. S. paid him well for it.

Mosquitoes must be bad here, for the Cuban looked unutterable misery when asked if there were many. A white man who gets honey in such a place gets it under many difficulties, and at quite an expense.

It was on again through holes in the bushes, and in some places we had to shoulder our wheels. Right here, where there were acres of aguinaldo blanco in bloom, I took a snap shot at it while Bro. S. was establishing another apiary.

"Hey, Rambler, doesn't this beat California?" quoth S.

"There, Bro. S., don't bring up such trivial things in comparison to California."

STIRRING UP THE NATIVES—AGUINALDO BLANCO PLANT.

"But, by George!" quoth Bro. Faulkner, "that beats New Jersey."

About noon we struck the head of another bay, and, luckily, two or three palm huts. The occupants seemed quite taken by surprise and evident alarm to see three wheelmen break through the bushes into their little settlement.

Mr. S. fired Spanish at them, with the result that we had a very good dinner served. Eggs, sweet potatoes, bread and coffee, but not a taste of honey, and tons of it going to waste. We had five men, four women, more or less children, and four dogs, all looking at us while we ate.

"Hey, Rambler!" quoth Mr. S., "what do you think of this—doesn't this beat California?"

"Bless me, no; we have Mexicans and Indians, worse than this, in California."

"But, dear me!" said Mr. Faulkner; "this does beat New Jersey."

Here, where there was so much help available, Mr. S. established two apiaries, covering both sides of the bay. He is after the wasted tons of honey. All of the afternoon it was rough cow-paths, through old sugarcane-fields, and ruined sugar-mills. We all received more or less ludicrous falls from our steeds; but Mr. S. kept establishing apiaries right along.

In the edge of the evening we emerged from the bad roads and struck the good calzada; and, what a relief! Our wheels spun along as though they were suddenly possessed of life, and we were soon at our journey's end. We had planned another trip the next day; in fact, the Rambler did take a spin of 20 miles to Havana. But Bro. Somerford kept his bed. I had a notion to send for Dr. Hochstine, to cheer him up; but after feeling his pulse I did not consider his case dangerous. Suffice it to say, that California came out ahead every time that day.

.....

NOTES OF TRAVEL.

A Visit to the Limekiln Canyon Apiary of M. H. Merdleson, near Piru; the Prettiest Located Apiary in California; the Wonders of Los Angeles and Pasadena.

BY E. R. ROOT.

I made a stop of about ten days in the vicinity of Los Angeles; and of all the places I visited I do not know of any where I would rather live and die than here in the City of the Angels, if it were not for one thing—the gilded saloon. It is made up of the cream of the best society of the East, who, by reason of ill health, have been compelled to go west and seek a climate where health could be secured and life made possible; and it has also some of the scum of the earth in spite of its angelic name. Excepting San Francisco, one can get just about as near hell on earth in Los Angeles as he can anywhere in the United States. But this is hardly true of Pasade-

na. It is a city of *no saloons*, and is only a short street-car ride from Los Angeles. It is located in the midst of some of the prettiest scenery in the world. It has been truthfully said, that one stopping in this no-saloon town may take a sea-bath in the morning by taking a car and going down to Santa Monica, the seaport of Los Angeles. After his wash he may take the trolley-car again, stop off at Los Angeles and Pasadena, and pick strawberries, and flowers by the wagonloads. In the afternoon, if he is so inclined, he can take the car for Mount Lowe. In the course of an hour or so, after a very picturesque ride on an electric car that glides from earth to the clouds, he can get into a sleigh and have a genuine old-fashioned sleighride, and snowball to his heart's content. After he has taken in winter scenery on the mountaintop he may return and get to his hotel before six o'clock, *and all this in one day*. Talk about variety! Why, one can have in Los Angeles or Pasadena, any thing he wants. He can go to the finest churches. If he is a theater-goer he will find the best and the worst in that land. If he wishes to see what there is bad in humanity he can have that desire gratified at Los Angeles. Any thing and every thing that goes to make up civilization, farm life, suburban life, city life—hot, cold, cool weather—all of these and more are to be had.

Speaking about saloons, I have never run through a town or city that was blessed or helped by their presence; and when I came into a no-saloon town I could always notice the quiet peaceful atmosphere pervading the place. This talk about saloons being necessary for taxes, for street-paving, and all that sort, is sheer nonsense. Paving! why, Pasadena has the best in the world. It even goes so far as to put up an elevated cycle roadway that goes for miles right over the streets, and right over every thing. One can go spinning in mid-air almost up to the foot of those great mountains.

THE UNION HIVE AND BOX COMPANY.

While I was staying in Los Angeles I made frequent calls at the factory of the Union Hive and Box Co., the largest bee-supply establishment in Southern California. It employs quite a force of men, and at the time of my visit the whole establishment, from office down, was heels over head in business. It is located right in the heart of the best bee country in California. Mr. Raze, the general manager of the concern, is an excellent business man, and a pusher. He, like nine-tenths of the other people of Los Angeles, is an Eastern man; but owing to ill health he went to the garden-spot of the world; and when I saw him, notwithstanding he was working overtime, and was straining every nerve to fill orders, he seemed to be the very picture of health. He came east again recently to the scenes of his boyhood days, and stopped at the Pan-American; but "the water" and "the climate"—this horrible climate that we poor mortals have out here—were too

much for him, and the last I heard of him he was going back to God's country, there to stay. The way he is telegraphing in orders for extractors, sections, etc., I assume that he is busier than ever.

Passing from Los Angeles I made my way up to see J. F. McIntyre and R. A. Holley, in the vicinity of Fillmore; but owing to the fact that certain of my pictures were not finished, as I supposed, I am obliged to make a jump, and skip these people temporarily, and drop down near Piru City, near which M. H. Mendleson has one of his celebrated apiaries, the Limekiln yard, about half an hour's drive from Piru. This apiary is located, as the name indicates, in the bottom of the Limekiln Canyon, or what I termed Rattlesnake Canyon, for Mr. Mendleson's men killed some seven or eight of those reptiles on the mountain-sides before I arrived; and I was constantly reminded to look out and not step on the beautiful pets.

The apiary as a whole is shown in Fig. 1; and of all the picturesque spots for a bee-yard, of the entire six thousand miles of my travels, I do not know of any more beautiful, or one more favorable for the production of honey, than this one right before us. The celebrated Sespe apiary, belonging to J. F. McIntyre, nearly equals it in its surroundings; but of this I shall have something to say later on.

I spent three or four days with Mr. Mendleson, "baching" it with him and his

men, and how I enjoyed it! The clear bracing mountain air gave me an appetite the enjoyment of which I shall never forget—the flap-jacks and other good things that Mendleson's bachelor cook spread before us could fill any "aching void." As the sun went down over those mountains the air would begin to turn cool, though it was almost July. Sleep! one could roll up under the bed-clothes, shut his eyes, and, presto! the sun would be smiling over the tops of those mountains again, for I slept late and hard.

As you will see by the pictures, I took several strolls with the camera and tripod over the vicinity. I clambered up, unbeknown to the boys, with the camera, and the first they saw of me I was hundreds of feet above their heads. A loud "hello!" warned me to look out for "rattlers," and I did. The tripod that I had was in the form of a pole that could be folded up, making a very respectable club or mountain-stick. With this I felt reasonably secure; but still I had a nervous fear that I might get bitten. Every now and then I would run into some prickly cacti or Spanish needle; and before I knew it I would be seized with a creepy horror of "snakes in my boots;" but the real creepy things I neither felt, saw, nor heard.

The Mendleson apiary is down in the bottom of the canyon. The ground was somewhat of a side-hill originally, and Mr. Mendleson himself, with a great deal of la-

FIG. 1.—APIARY OF M. H. MENDELESON, IN LIMEKILN CANYON.

FIG. 2.—A CLOSER VIEW OF THE APIARY. MR. MENDLESON AND SOME OF HIS HONEY.

bor during that part of the year when bees were doing nothing, terraced off the ground so that it was as pretty as a picture. In the upper portion, Fig. 2, will be seen the straight rows. There would be from one to two lines of hives on a terrace. On the one above that, there would be another line or two, and so on clear up to the foot of the mountain.

This yard, at the time of my visit, I think had something like 500 strong colonies, and the bees were fairly booming. Twenty tons of honey had been taken off; but as the season was drawing to a close, only about five tons more would be taken.

Mr. Mendleson apologized for there being so many old hives he had bought up, but showed me a row of new Danzenbaker hives

FIG. 3.—MENDLESON AND ONE OF HIS DANZENBAKER HIVES.

which were devoted to the production of honey. By the way, you may guess who that fellow is in the foreground in the upper portion of Fig. 2. I had planned to take pictures of all the force employed at that yard; but the boys would not consent to any snap shot unless I would dress up in old clothes as they did. They were not going to have any city chap come to their canyon and photograph them in their every-day attire unless I would come down to a common level with them. As I wanted the fun and

"experience" of helping to extract and do some of the work in true California style, the boys kindly fixed me out in a suit of overalls and jumper. Notwithstanding they were clean, they were somewhat the worse for wear, and fit—well, you can see for yourself. I put them on; "and now," said the boys, "you look real handsome. Let's have your picture."

"All right," I said; "fire away."

As they took me in, I was taking in, as was my custom, the mountain scenery which I so thoroughly enjoyed.

The little patches seen along the mountain sides, not the larger bushes, were practically all mountain sage. Most of it was black sage, some white sage, and some button sage. But of these I will have something to say in our next issue.

MENDLESON'S COMB HONEY.

After the boys had "done me up" in the camera I took several shots of them; but, unfortunately, the pictures were poor. But I secured a very good representation of our friend Mendleson sitting down beside some of his honey. Nor was that the best—a picked lot—by any means. It was two or three cases taken at random and set down on the hives. I then requested Mr. Mendleson to sit down beside it, and the view is seen in the bottom of Fig. 2. This is all 4×5 plain sections, produced in Danzenbaker hives, for Mr. Mendleson seems to be an admirer of the Danzenbaker system, for comb honey. While he produces a great deal of $4\frac{1}{4}$ honey, he seems to be working over toward these beautiful tall boxes.

In Fig. 3 we get a view of how Mr. Mendleson tiers up his Danzenbaker hives for the production of comb honey; for he stands before one of these hives, in the act of removing the cover. Like many a bee-keeper he makes use of a broad-bladed putty-knife, as will be seen, for removing the cover, separating the frames, or for any work of that sort.

MENDLESON'S STORAGE-TANKS.

In Fig. 4 we have a view of some of Mr. Mendleson's ten or twenty ton honey-tanks. The extracting-house is shown over at the right. The pipes run from a strainer just under the extractor, and communicate directly with these tanks. In one of these tanks Mr. Mendleson had two feet of honey candied solid. The tank was six to eight feet deep, four or five feet across, and the problem was how to get it out. I clambered up on the sides and looked in. Said I, "The only way you can get it is to get down there yourself with a spade and dig it out, put it into pails, and then melt it up."

EXTRACTING BY STEAM POWER; THE TIRED YANKEE AND THE STEAM-ENGINE.

I said I desired to help Mr. Mendleson in true California style, and I did. To me was assigned the task of turning the crank of a six-frame Cowan extractor—one made by the Root Co. I did not know what was before me or I think I would not have been

so eager to jump into the work. Mr. Mendleson took off the combs, with the help of one of his men. The cook, Mr. Edmonson, did the uncapping, and I did the rest. After I had turned the machine for two hours I began to think there might be some easier job. I turned and turned, and puffed and blowed. The sweat ran down my nose in great drops. As Mr. M. came in with one load of honey I said to him, "Oh my!" for my breath was *almost* gone, "what is the matter of having a little engine to run this? What is the use of a man breaking his back when a quart of gasoline would run this all day?"

"I have had that in mind, Mr. Root, for some time," he said; "but I just wanted to put *you* at the job so that you people at

Co. has made arrangements whereby it can furnish a one-horse-power outfit, boiler and all, complete, to run any of these four or six frame extractors. The boiler can be used with gasoline, wood, or coal; and, what is more, steam is one of the handiest agents a bee-keeper can use. He can use it for rendering honey or wax, for cleaning utensils—in fact, it has a dozen and one uses; and, taking it all in all, the steam-outfit for the average person is far more suitable than a gasoline-engine.

HOW MENDLESON CONTROLS HIS BEE-RANGE.

Mr. Mendleson has about 500 colonies in his apiary, and about 250 at the bean-fields. The Newhall Brothers own about 49,000

acres, taking in all the land seen in the photo, and a great deal besides. This land has been purchased for the purpose of putting down oil-wells. In fact, right back of Mr. Mendleson's honey-house is a large oil-derrick. He has leased all of this 49,000 acres of land so that no one else can put a bee-yard down anywhere within bee-range of him.

Taking it all in all, Mr. Mendleson has an ideal location in one of the prettiest spots in the world, and has a contract that makes his bee-range secure so long as he desires to control it.

He has a modern honey-house, and all the conveniences for baching it in good California style.

FIG. 4.—MENDLESON'S HONEY-TANKS.

Medina could see the necessity of getting up a light, simple, one-half or one horse power—something that can be started and stopped readily, and yet make the combs spin good and hard."

"Yes," I said. "From what Mr. McIntyre told me it is not possible for hand power to generate sufficient centrifugal force to clean the combs as thoroughly as can be done with some sort of motor power. Then, too, the extractor might be running all the time that one was uncapping;" for it was easy to see, while I was turning the crank, that honey would keep flying in a spray off the combs, notwithstanding they were supposed to be fairly clean.

Ever since that, I have been revolving in my mind some sort of cheap power. A gasoline-engine would, perhaps, be the cheapest; but on account of its lack of control, starting and stopping, and unvariable speed to conform to new or old combs, it would hardly be as suitable as a water-motor, such as Mr. McIntyre uses, or a little steam-engine, the speed of which can be controlled by means of a throttle-valve. The Root

OPENING HIVES.

Some Good Orthodox Teaching Indispensable to the Beginner and Helpful to the Veteran.

BY G. M. DOOLITTLE.

Question.—I do not remember to have seen in the bee-papers an account of the proper way to approach and open a hive containing bees. I take it that there is a right way, and that the same methods should be used both in the East and West, locality cutting no figure in the matter. Of two bee-keepers here, Mr. A approaches a hive, stands a little to one side, and puffs a little smoke into the entrance; then, stepping to the rear, he gently lifts the rear end of the cover about an inch, blows a little smoke over the tops of the frames, lifts the cover entirely off, and drives more smoke down between the combs into the hive. Mr.

B's method is the same as above, with this exception: Just after puffing smoke in at the entrance, he gives the hive a sharp rap or two with whatever tool he may happen to have at the time, or even with his foot. Now, Mr. A claims that the kicking or rapping on the hive tends to anger the bees. Mr. B, on the contrary, claims that it alarms every bee in the hive and causes them to fill with honey, while by depending wholly on the smoke there might be some bees which would not get any of the smoke, consequently would be in good fighting condition by the time one got to manipulating the combs. Now, I should like your opinion of the above methods. Is either method correct? and, if so, which one? Is either one or both of them faulty? and if so, why? An answer through GLEANINGS would greatly oblige.

Answer.—I am very glad this matter has been brought up, for I find that there are very many in the bee-keeping ranks who do not understand just how to open hives; and I think the majority of apiarists use their bees much more roughly than is best for either themselves or the bees. I never could see just why the bees of *every* colony should have their eyes nearly put out, or their breath nearly taken away with stifling smoke, simply because some awfully ugly colony needs such a mode of treatment in order to subdue them, so that the apiarist can conduct some needful manipulation. So, then, we have a knowledge of each individual colony as the governing thought in our manipulating bees, rather than any method which allows us to treat each and every colony alike. If we do not know the temper of a colony we are about to approach, then we should go cautiously till we find it out. And after finding it out, then we are prepared to operate on that colony in just the same way every time, before each and every manipulation, so long as the colony keeps the same queen it had when we first found out its peculiarities. And, as our questioner says, this principle should hold good in any locality, whether it be north, south, east, or west. The idea of treating every colony alike, then, is the first fault, as I consider it, in both methods given.

The next fault, as I consider it, is the blowing of smoke in at the entrance every time *any* colony is manipulated. This I consider a waste of time, a waste of smoke, and a needless disturbing of the bees, taking 99 cases out of 100. And this applies to both methods, as both A and B do this. In my manipulation during the whole of the year 1901 I remember blowing smoke in at the entrance of only one hive, which I will speak of further on. Never do this unless you have an extremely ugly colony. Then in most cases it is a mistake to think, as does B, that *every* bee in a colony must be alarmed, and caused to fill itself with honey. This is entirely needless with the average colony, and causes not only a waste of time and trouble to ourselves, but is an

actual damage to the workings of any colony so treated. If close watch was kept it would be found that very few bees would go out to the fields within the next hour after a colony was so treated, to say nothing about the loss of time inside of the hive from this causing every bee to fill itself with honey, and then disgorge the same again, besides the uncapping of the cells by the bees in order to get at the honey, and the recapping of those cells again, after the honey is put back. Where any colony is procuring nectar at the rate of 10 lbs. a day I always considered it a loss of at least $2\frac{1}{2}$ lbs. to thus treat a colony for one manipulation; consequently I never do so unless I know that I am actually obliged to in order to perform some operation needed with an ugly colony. The kicking or rapping should not be entertained by any one except with the ugliest of all ugly colonies, and in such a case two or three kicks or raps are far worse than nothing, as it only arouses the ugly colony to the fighting point at the outset. Now, with this explanation, I doubt whether I can do better than to tell just what I do in my apiary. With the average colony, when manipulating the same, before the supers are put on. I take my lighted smoker with me, with my seat and tool-box combined. This latter is set down in the right place on the sunny side of the hive, so that the sun is at my back when seated, for the sun shining on any bee-veil very much hinders and obstructs the vision. The smoker is set on the ground close by. I now gently pry up the cover, or roll back the quilt, in accord with what the hive is covered with, placing the same within handy reach for replacing. I now proceed to manipulate the frames as I wish, using a little care in taking out the first one; for if there is any resentment it comes immediately on lifting the cover, or on the removal of the first frame. Afterward, when the light has been allowed on and in among the combs, no trouble is experienced unless you carelessly kill bees or roughly handle the frames. The manipulation over, I wish to close the hive, but find that, if the colony is at all populous, there are bees in the way of putting the cover on, which will be killed unless driven out of the way. I now pick up my smoker for using, for the first time, and gently blow smoke over the top of the hive, only just enough to cause the bees to run down out of the way, put on the cover, and go to the next hive. The bees have been working on all the time, just the same as though their hive had not been touched, even flying from the combs as I hold them in my hands, off to the fields, by twos or tens, as they often do. The next hive, I know, will not let me handle it as I did this first, without resenting it; so in this case, as I raise the cover I blow a little smoke under it (say two or three puffs), as soon as the cover is raised enough to stick the nozzle of the smoker under it. The cover is held thus for five to ten seconds, as this confines the smoke over the bees to

a certain extent, and causes the most of those on the tops of the frames to run down, when the cover is lifted. I now proceed as before, and, as a rule, use no more smoke till I come to the closing of the hive, when the bees are driven out of the way for closing up. If, at any time during the lifting of the first frame, or later on during the manipulation, some of the bees become restless and show fight, I gently puff a little smoke on these restless ones; but it is very rarely that I have to do this.

We now come to the colony which is known to be ugly—so ugly that it will drive every thing before it if we attempt to open it in the same way we have been doing with the others. And this is the one out of the 100 that I spoke of above. Here is where I use smoke at the entrance. After having decided that the loss from neglecting to manipulate such a colony will be greater than will be the loss from such a vigorous treatment, smoke is blown in at the entrance, sufficient to frighten the guards, when I begin to pound on the top of the hive with the doubled-up hand, say five or six blows. I now blow more smoke in at the entrance, for, if I do not, these vicious bees will be right out after me; and so I alternate smoking and pounding for from two to five minutes, or until I know that every bee is filled with honey, and all of the “ugly” is scared out of them. On raising the cover I find the bees mostly at the top of the hive; and if there is any black blood in them they are ready to stampe all over the hive, down under it, or anywhere else, which is very unpleasant, and thus the manipulation has to be done in a way not inviting to the manipulator, even though there is some satisfaction in knowing that you are master of the situation, and that with the ugliest colony ever dwelling in a hive. Even the most vicious Cyprians can be handled in this way. But, as I said near the start, with only one colony did I use this last treatment during the year 1901. All of the rest of my work with the bees, which was nearly all the time from May to October, Sundays excepted, was performed as given for the first two. After the supers are on I generally use the second plan with all colonies that I am obliged to manipulate, as it hastens matters by driving the bees out of the way which are between the stories or between the supers and the hive. But in all of my manipulations I use just as little smoke as possible with the accomplishing of the object sought.

In closing let me say that, with the exception of a colony or two, I never open hives unless there is something of importance to be gained by so doing. Each year I set apart one or two colonies to “play” with, or for the conducting of some experiment I may wish. These colonies are selected out from those which need no smoke, except in closing the hives, and are placed near by the entrance into the apiary, so that I do not have far to travel while experimenting, nor far for visitors to go to see

them. People who are afraid of bees, and yet desire to see the inside of a hive, are often offered from two to five dollars for every sting they receive, but as yet I have never had to pay any thing, although I often think I may, as these timid people often become so enthused and enchanted that they will thrust their fingers right in among the bees, not remembering that only a few moments before they were *sure* they would be stung if they went near them.

QUEEN-REARING.

Why we Should Rear our own Queens.

BY W. H. PRIDGEN.

Since the dawn of modern apiculture there has not been a time when there was the same interest manifested in queens and queen-rearing as now. The tendency on the part of honey-producers is, to a greater extent than ever before, to rear their own—not only because a larger proportion of those reared at home give better results than those transmitted through the mails, all else being equal, but because the essential conditions for the production of the highest type are more generally understood.

The cardinal points were given to the public years ago by men who spent much time and talent in experimenting; and by their persistent efforts the foundation was laid, not only for the most fascinating branch of our pursuit, but the most promising field in which to spend our thoughts and energies.

Bees are no longer regarded as bees without considering their qualities; but each progressive bee-keeper is continually on the lookout for superior honey-gatherers and other desirable traits shown by individual colonies.

The ability to rear our queens from the best mothers, and control their mating to some extent by weeding out and preventing the production of objectionable drones, and thus, step by step, make permanent improvements in the working qualities of our bees, not only increases our profits but lends enchantment to pleasure.

We are indebted to Messrs. Doolittle and Alley for the fundamental principles of what is termed artificial or scientific queen-rearing, who differ in some of the minor details. For instance, Mr. Doolittle uses artificial queen-cups to which he transfers the larvæ with a toothpick, while Mr. Alley prefers strips of worker comb containing eggs ready to hatch, over which the bees fashion the cells to their own liking.

As these veterans differ on some of the less essential points, so also do others differ with them, and consequently the subject is kept alive—short cuts devised, and modifications made by the lovers of the art.

In some of the manipulations, as much is accomplished in a few hours now as was formerly done in as many days; but what works perfectly in the hands of those who

conceive new ideas and adopt measures to carry them into effect, are often considered to be failures by others who have become proficient in more faulty methods with which they are acquainted, and hence the diversity of opinion as to the best or easiest way to accomplish certain ends.

Without these differences of opinion, and failures that lead to investigation, new ideas or the different ways of accomplishing the same thing would not come to light; and in going over the ground that has been covered by those who have contributed toward the success of modern queen-rearing, the object is to lend a helping hand toward a further advancement of the industry.

As a rule, the reader cares but little how, when, or from whom the writer gained his information, but generally prefers the part relating to the object in view; and inasmuch as it is generally known who advanced the different ideas that make up our queen-rearing system, in complying with the request for a more elaborate treatise on the subject these explanations will be omitted to some extent, without any intention of doing any one an injustice.

POINTS ON THE INTRODUCTION OF QUEENS.

From my experience in introducing queens by using bees from the colonies to which they are introduced, I consider the plan outlined by Mr. Bonney far superior to the usual instructions that accompany shipping-cages. In fact, I have not attempted to introduce one in years with the cage in which she is received without first releasing the escort and caging some of the bees of the colony with her, which invariably treat the queen kindly if very young, or have filled themselves with honey. It also works equally well if the queen be caged in an odorless cage without any bees, but still better to use the bees and odorless cage, or the odorless cage without the bees, first scented by allowing the queen to be superseded to remain in it an hour, in the hive; but I prefer scenting the cage with the old queen and then using the bees with the queen to be introduced, either by placing her in it and selecting the bees one at a time, or allowing them to go in, which they quickly do in search of their mother, and close them up for awhile, and then allow the queen to run in.

One advantage worth considering in having bees with the queen is that she is less liable to be damaged by the outside bees by getting hold of a leg or wing. I am partial to side-comb cages, as the queen is placed right down in the cluster; but instead of relying on hatching brood, young bees are at once put into the cage with the queen, through a hole near one corner, as large as a leadpencil. The hole is stopped a day or two with a cork, and with candy when the cork is removed, thus allowing the bees to release the queen, and combining the good points in the different methods. A great deal of this is too complicated for a novice,

and no doubt for that class the usual instructions are best; but before being too confident of uniform success by pasteboarding it should be remembered that, when queens are sent by mail, bees, cage, and all partake of the scent of the mails, and from this source much of the trouble arises, and there will not be the success that attends the same plan if the queen be changed to a fresh cage, thus removing much of the odor.

Bees will often destroy their own queen if given back after having been caged an hour or two with some of her own bees in a cage that has an odor that is transmitted to the queen.

Inasmuch as Dr. Miller was impressed by the fact that bees caged with a queen from a different colony were kind to her, I wish to say that, when robbers are bad, I often prepare a number of cages with escorts, by selecting the returning young bees that are taking their playspells, and find that it works well, as they always treat the queens kindly, are exactly the right age, and I have only to keep the nuclei open long enough to find the queen.

Creek, N. C.

[When Dr. Miller first spoke of this plan in his *Straw* (p. 680, 1901) I did not take much stock in it; but I am free to confess that there must be something in it after all. Caging the bees, and keeping them so until they have a real sense of their confinement or loneliness, no doubt puts them in a condition where they are ready to take up with *any* queen. When they are given back to the whole colony having the same scent, the new queen with them, all goes on lovely. But, as Mr. Pridden points out, it is doubtful if the beginner would be able to recage or change the escort. But the advanced bee-keeper may well give it a trial. I should be pleased to hear from others.—Ed.]

THE SWINSON JUMBO HIVE; SOME GOOD REASONS FOR ITS ODD CONSTRUCTION.

Mr. Root:—On page 232, in your footnote to my article on the Jumbo hive, you say, "This particular hive seems to violate all the principles laid down in hive-construction in modern bee culture." And, again, "Taking it all in all, I doubt whether the average bee-keeper in average localities would secure as good results in such a hive as those obtainable from the ordinary standard hive on the market."

In your first proposition you may be correct or you may not. That depends on what you term "modern bee culture." With me, Mr. Root, this hive is the "hive-construction in modern bee culture," there-

fore is in perfect accord with it, instead of violating it.

In the last proposition quoted, I think I can agree with you. "Another principle that has been laid down is that it is a mistake to give bees too much surplus room *at the start*." That is a principle that *has not yet reached* this section of the country. You can't give them too much room at the start in our section, nor in any other *warm climate* where the *surplus-honey* flow lasts only ten or twelve days, and bees store from 5 to 25 lbs. of honey per day, average 12 lbs. per day, for ten days. Why, I very seldom take off those large stories *during winter*. Most of my hives have to-day those large stories on them, some of them filled with sections, just as they stood last summer. I always give my colonies the full 112 sections some four or five weeks ahead of the honey-flow, and often do not have to raise even the *lower section-case*, as the bees enter both *about the same day*. Especially is this true if the surplus flow is a *little late and heavy*.

In 1898, from a hive having only six L. frames in the brood-chamber and twelve L. frames in the surplus-apartment, I got 71 L. frames built out and filled, inside of 16 days, with honey—something like 400 lbs. of extracted honey—by setting two surplus stories on top of a six-Langstroth-frame brood-chamber.

The bee-keeper here who uses a 24 or 28 section apartment on an eight or ten frame hive gets only about one-third or less of the honey crop as his share of the flow to each colony. I have just had cut 100 of those Jumbo hives, and expect to use the 15,000 sections (in addition to a number of Langstroth frames this season) I ordered of you in them for comb honey alone.

Our bees build out beyond the brood-chamber when honey is coming in freely. This may not be "long tongue-reach," but it is *building out right*—don't you see? They seem to have no regard for confining their storage to just the limits of the brood-chamber.

Our surplus-honey flow doesn't advance. It hops right on, and then, after a few days, it recedes to return another season.

ABBOTT L. SWINSON.

Macon, Ga., April 4.

[With your conditions of honey-flow it is easy to see why your hive is eminently adapted for your locality. This only illustrates the importance of each one studying closely his locality and then adapting himself to it.—ED.]

WAS IT FOUL BROOD? IF NOT, WHAT WAS IT?

The experiment with foul brood, by T. F. Bingham, calls to mind an experience of my own, except the mode of curing with sulphur smoke and the discovery of cure in my own case. About the middle of May, 1901, I discovered a colony superseding its queen. At that inspecting I could not detect any thing wrong, but those bees could. Imag-

ine my consternation, ten days later, on discovering a fully developed case of foul brood, answering in every particular to the description in my text-books. More than half of the brood was dead in different stages of development, but they had succeeded in hatching a nice young queen, and at the proper time she began to lay, sharing the burden of the old queen, both being present and laying. From this time on the percentage of dead brood was not as great—perhaps one in twenty. About the 15th of July they had become quite strong, and I thought I would clip the wing of the young queen. The old one had hers clipped. On putting her down the bees killed her. That left the colony with the old queen, and from this on the malady grew worse. I would say about two-thirds of the brood was dying. This gave me the cue. It was the old queen that was the cause. I supplied them with a new queen, and they cleaned up house and started in with new vigor, and the malady completely disappeared from that colony. I had one other colony affected in the same way, but it yielded to the same treatment.

The question now seems to be, "Did the sulphur smoke have any effect, or was it the new queen that did the work for Mr. Bingham?" Then, again, was it foul brood? I had come to the conclusion that it was not; and that the defect was with the queens alone.

The bees have wintered well with me on the summer stands, packed in winter cases. I lost one out of thirty. A. OLSON.

Annis, Idaho, April 22.

[Your surmise is, I think, correct. The malady, whatever it was, was due to some weakness of the old queen. It could hardly have been foul brood, for that disease, as we know, would not disappear on the removal of the queen.

Unless one has seen foul brood so that he is *sure* he knows it on sight, he might, from the descriptions or symptoms given in the books, mistake pickled or dead brood for it; then if he applied some mild remedy, conclude that that had cured real foul brood, when the other disease would, in the ordinary course of events, disappear of itself.

What the particular malady was which your bees above described had I can not say, unless it was pickled brood, and that sometimes disappears right speedily on a change of queens. In the absence of any further facts I should say what your bees had was a case of pickled brood pure and simple; for that does in fact look like foul brood, but differs in the ropiness of the dead matter.—ED.]

WINTERING IN A LARGE CELLAR.

I followed your plan of wintering in a small compartment within a large cellar. I wintered twelve colonies thus, and they are stronger at this date than any we wintered before—not a weak one nor one dead,

and very little spotting of the hives—not nearly as much as those I wintered out of doors. I built a small cage 4x4x4 ft., and covered it with three or four thicknesses of burlap. All the air the twelve colonies got was what would percolate through this. While the temperature in the main cellar (22 x 50 ft.) would vary through the winter from 39 to 48°, the temperature in the bee part never went below 41; usually it stood at 43 to 45, and ran very even. I never heard any roaring all winter. They were very quiet except when I opened the door; then one could hear a low murmur, which told me that they were doing well. The bottoms of the hives were removed, and they were raised up on two-inch blocks.

I have for a number of years wintered packed on the summer stands, with fair success; but I shall in the future winter in cellar as above, with more colonies.

The windows were opened occasionally all winter, but the fresh air from outdoors did not come in contact with the bees direct. I am very much pleased with this method of wintering so far. GEO. SHIBER.

Franklinville, N. Y.

GLUCOSE, AND WHAT IT IS.

I read much about glucose, but I don't really know what it is. Of what is it made, and what is it made for? It certainly must be made for some other purpose than for dishonest people to adulterate honey and perhaps other articles of food.

Tilleda, Wis.

S. A. R.

[Glucose is a mucilaginous kind of syrup of low sweetening power, made from corn. The ordinary commercial article contains so much sulphuric acid that is used in the process of its manufacture that it is not fit for any purpose as food. If glucose is used for any honorable purpose in the way of a legitimate food product in its real name, I do not know what it is. The industry for the manufacture of this corn syrup is very large. A great part of the product goes into the business of making beer (and I have about as much use for beer as I have for poison), and the rest of the product is used for adulterating syrups and honeys. Consumers will never buy it if they know what they are getting; and the commercial product is so vile when used in honey that it will disgust each consumer with all honey, if he thinks that honey is pure. A highly refined glucose is probably not unwholesome; but this article is too expensive to use for the purpose of adulteration.—Ed.]

WINTERING HIVES WITH DEAD BEES IN.

I have secured nine hives of bees in what I think are known as the Hilton chaff hives, containing 8 sections each of the Hoffman frames. The bees have been neglected, and on examining the hives I find the combs to be almost black. The upper half contains honey that seems granulated, and the lower half is empty, hard, and black. In each

case there are many dead bees in the bottom of the hive. Will the bees carry these dead ones out, or ought I to take them out? If so, how? What shall I do with the comb? I see from one of your books that you do not recommend the use of gloves. A sting on my hand causes unusually large swelling, and remains several days. What will be best for me to do aside from the advice not to get stung? A. N. HENNE.

Thompsonville, Mich.

[It is advisable to take a long slender wire with a hook on it, and rake all the dead bees out if there are some bees alive in the hive. If they are all dead, remove all the combs, brush them clean of the bees, turn the hives upside down, dumping the bees out; scrape the bottom-board and give it a general cleaning. Gloves are all right under certain circumstances, and in your case they would be indispensable. The bees will remove the honey that has granulated in the combs if you starve them to it. Better uncap and soak them in a tub of warm water, after which give them to the bees to clean up.—Ed.]

THE COMMISSION MEN AND LABELING COMB HONEY.

What you say in regard to D. I. Wagar, p. 293, labeling comb honey, certainly ought to have great weight. Why should we bee-keepers allow ourselves to be put on the back seats when we should have a front one? The berry-producer, the fruit-producer, the chicken-raiser, the flour-mills, and, in fact, every producer, has his brand on his produce, and even some of the commission merchants stamp their goods over with their own name and stamps. This I know to be a fact. Now, why not the honey-producer? I fully indorse all Mr. Wagar says in reference to this matter. Referring to your comment to Mr. Wagar, the consumer does not buy nor eat the name, nor is it one out of twenty who looks at the name unless the grades differ. Set two fancy articles side by side, having them just the same every way as a fancy grade of honey should be, the customer would as soon pay 20 cts. per lb. for Mr. B's as for Mr. A's. Why? Because they both come up to his liking. The commission men have an excuse that the name and address of the producer hurts the sale of their crop. Not a tenth as much as these comb-honey lies. They have an effect in two ways; first, they reduce the consumption of honey; second, they reduce the price (but not the value). What would be a better guarantee of pure honey than the name and address of the producer on the cases, with the standing offer of A. I. Root and others? These could be printed at a small figure, and should be put on every case, and a couple in the cases to get scattered around.

Let us try this thing, and stamp our produce as the syrup-producer does, and others. White-clover honey (if pure and true to name) is white-clover honey, whether Mr.

B's or Mr. A's. If all the money were put into labels instead of stamps and paper to write to the editors it would be better spent.

I am working right across a road from my house now, on a 20-acre fruit-farm. My bees came through strong.

Norwalk, Conn. ROBT. J. CARY.

LABELING COMB HONEY; THE COMMISSION MAN.

Suppose you are the commission man, and, while you would be making your fine little speech to the bee-man, you would be thinking, "If Mr. A puts his name on his honey, and my customer fails to get his honey from me, he will order it direct from A, and that commission will not jingle in my pocket." Would The A. I. Root Co. think of putting its goods on the market under no person's name as manufacturer? Why should the honey-producer? If the commission man will not handle his honey, the producer can get along better without him with his name on his honey than with him without his name.

W. R. MARTIN.
Hackneys, Pa., April 10.

HONEY FROM ALFALFA IN KANSAS.

Mr. Editor:—I notice on p. 179 that you and Dr. Miller claim that alfalfa does not yield honey except on irrigated land. I have been in the bee business for only three years, and my experience teaches me that, if it were not for our alfalfa here, grown without irrigation, we could do nothing with bees in this part of Kansas. We have some maple, elm, box-elder, willow, fruit-bloom; then we have locust and catalpa. This is all good feed for the bees. About May 20 the first crop of alfalfa comes in bloom; about July 1, the second; in September, the third; and all other crops yield a good crop of honey of excellent quality. As yet the alfalfa-fields are very limited, but are enlarged every year, as the necessity of a hay crop is very much in demand, and the crop is mostly cut before the bees get the full benefit from it; yet, dry as it was the past season, my bees made, spring count of 30 colonies, over 1500 lbs. of alfalfa comb honey. I knew there was no other bloom for bees to work on, and we have no irrigation here; yet there is honey from alfalfa here of a better quality than where it is irrigated, as it is much thicker and heavier.

J. J. MEASER.

Hutchinson, Kan.

SOME THINGS ABOUT PEAR-BLIGHT THAT ARE NOT EXPLAINED.

That pear-blight subject seems absurd. How is it a tree that never blossomed, 15 years old, all of a sudden turns black, and, of course, dies? I've had that experience. I've had dwarf trees, the second year from setting (no bloom), black about all over, have had apple branches black and die—no bloom either. I am very sure the bees have no part in it. We may as well charge potato-blight to bees. There was a time

when old farmers really thought bees blighted buckwheat; but it is generally settled that they are a help in setting more seed by the complete pollenizing.

The season and something unseen must cause pear-blight, the same as fungus, which is so troublesome in many ways. Being a fruit-grower and bee-keeper I have no biased idea one way or the other. I am sure bees are a great help in the cause of more fruit, to say nothing of the excellent sweets and the wonderful things otherwise. Superstition should have no part in the above subject.

E. P. CHURCHILL.

Hallowell, Me.

RAMBLER TAKEN TO TASK; EXTRACTING HONEY TOO GREEN IN CUBA.

As Rambler is down here in the interest of GLEANINGS we shall have to hold it responsible for his statements, and ask for more information through it regarding them; and I wish, like some of his other Cuban friends, to enter a protest against his saying that we extract our honey too green. That may be the case with some of those bee-keepers who use one hive-body to hold a day's uncappings. Now, I don't claim to sling nearly as much honey in a day as some of the writers in GLEANINGS; but I have days when my uncappings of one day will fill a Boardman solar extractor four times with all it can hold. Now, most of the honey here is still raised in the Cuban box hives. These are extracted from three to four times in a honey-flow of from six to eight months. How does Rambler make this fact tally with his statement of honey being extracted too green? Then he goes further and makes us veterans here feel in doubt whether to be sad or glad that we are not in Tulipan.

He does not tell us whether that colony, page 288, that gave 90 lbs. at one extraction, was extracted only one time during the honey season or once a week as is our habit of doing here. If only one time, then it is not much for Cuba with its 30-cent honey; but if that colony gave that at each extracting, then it sounds like a land agent's yarn to us veterans. Tell Rambler to be precise in his writings on Cuba, as we are very touchy in this new republic.

THE AMERICAN TRAMP.

Punta Brava, Cuba, Apr. 21.

CAGES FOR QUEENS DURING SWARMING TIME.

What kind of cage is used to cage the queen in the hive, and how is the caging done? I wish to prevent swarming by caging the queen. Do you send packing with the double-walled hive when you send the hive in the flat?

P. HUNTINGTON.

Norwich, Ct., April 2.

[Almost any kind of cage will answer for caging a queen in the hive. The Miller cage described in our catalog, page 29, is

about as good as any I know of. It is flat, and will go down between the frames, and has compartments for candy. An ordinary queen mailing-cage will answer in lieu of anything else. We do not send out packing with hives in the flat.—Ed.]

MRS. HARRISON'S FLORIDA LETTER.

West Bay is an arm of St. Andrews Bay, about fourteen miles from the town of St. Andrews Bay. The settlement of West Bay is composed of persons from Alabama who came seeking health, together with the fine fish and oysters which the bay affords. These people have displayed considerable energy in making for themselves homes in the wilderness.

We came here from St. Andrews in a small sail-boat, partly as a missionary tour, to see how the church and Sunday-school were thriving. We slept upon the boat, and early on that Easter morning I found my way to the school-house, and gave the small plantation bell one tap. The door was open, and upon the table was part of a Bible and an envelope from the Baptist Southern Convention.

I walked around, breathing the soft, warm, sweet southern air; gathered a bouquet of lovely ti-ti blossoms, yellow jessamine, laurel, and a plant said to be California sage. A friend who had seen it growing there said it was the same. The bees were thick upon it, and humming happily. This sage grows all around this bay, upon land close to the water.

I saw a high bench upon which were tall box hives, shaded with a grove of bay-trees. The hives were full, and running over, with bees clustering out upon the front. They were diminutive black bees. There was a small ti-ti back of this apiary, and the ti-ti bush was blooming, with its fragrant long white racemes hanging thickly from every twig. Over all the yellow jessamine ran at random, with its great clusters of yellow bell-shaped flowers. Truly these bees were in the midst of plenty on this Easter Sunday. I was told by a woman near these hives that comb honey sold there for five cents per pound!

Though it was so early in the morning, the whole town was in holiday attire; and on my inquiring about the Sunday-school I was informed that it had died out, but they were going to start it again. They had no preacher the past year, but one was coming next Sunday, and would come to preach once a month.

Soon the whole settlement gathered upon the pier—men, women, and children—and went upon a large fishing-smack, with her white wings spread, for a day of pleasure, and—I had no Sunday-school.

MRS. L. HARRISON.

West Bay, Fla., Mar. 30.

[I have been nearly all over the United States, but never yet have visited Florida. I hope the time will come when I may drink in the pleasures of which you speak.—Ed.]

In uniting two weak colonies by placing one hive on top of the other, do you leave both queens in to demonstrate the theory of "the survival of the fittest"?

LAURA S. ROSS.

Jefferson, O., March 18.

[Where one queen is as good as the other it is the practice to let the queens fight it out, on the principle of the survival of the fittest; but if there is a choice, then of course the bee-keeper should pick out the inferior one.—Ed.]

THE BEE-KEEPER'S HOPE.

BY HARRY LATHROP.

I wonder what the crop will be
Next season, Mary dear,
'Tis true we had to feed the bees
To help them out last year.

The spring was cold and backward too,
The bees could hardly fly;
And then the drouth of summer came,
And caused the flowers to die.

But after while some showers came,
Refreshing wood and field;
And that sweet clover in the lane
Helped out the scanty yield.

In summing up the season's work
We found the blessings counted
Outweighed by far the pain and loss
In all that time surmounted.

Thus we may gain from year to year,
From sales of bees and honey,
Enough to keep our credit clear,
As well as save some money.

There's much of toil and little gain
In thi-our occupation;
But we'll not envy those who aim
At larger compensation.

For God has given to mortals here
Great blessings without measure;
We have our share of right good cheer,
And much of sinless pleasure.

We hope for better luck next year;
'Hope' is the bee-man's refuge;
But luck is pluck, success means work,
It's been so since the deluge.

'Twas work that brought our first success;
Yes, work that first began it,
And work will finish well the day,
We may depend upon it.

So come along, companion dear,
We'll wait until to-morrow,
To bear the load of toil and care,
To-day no trouble borrow.

Blessed are the meek; for they shall inherit the earth.—MATT. 5:5.

Charity suffereth long, and is kind.—I. COR. 13:4.

But the wisdom that is from above is first pure, then peaceable, and easy to be entreated, full of mercy.—JAMES 3:17.

I have spoken several times of the spring on our place, away over at the further corner of our 40 acres, and over one-fourth mile from our "cabin"—the one that runs 300 barrels a day. Well, that spring, after running a few rods, gradually disappears in the black sandy loam and woods dirt, and this spot has always been covered with the rankest and most luxuriant vegetation. When I first saw it I declared I would some day clear it up and try it for celery, onions, etc. Not only did all kinds of wild flowers flourish here, but it was a regular thicket of maples, elms, ashes, basswoods, etc., from 1 inch to 6 inches in diameter. The huge stumps bore witness that at one time great trees flourished here; but they were all cut off years ago. We have just cleared up about half an acre about this spot.

On the morning before commencing the work, I remember asking God to prepare us for the trials and vexations that the day might have in store for us, and to give us the Holy Spirit in our hearts that we might disarm and drive out the evil one, should he come near and gain a foothold. My helpers were two boys, two men, and a splendid team of heavy horses. The small trees I have mentioned were cut off two or three feet up, and the big team then "yanked" them out with a stout log-chain. You may say this is a simple matter; but I very soon decided there was considerable science in pulling stumps, especially where there were so many small ones. A team heavy enough to pull a green elm four or five inches through is necessarily unwieldy, and should not be backed, or turned around any more than can be avoided. The owner of the team commenced by pulling one, then backing up to get the next close to it, and so on. Well, elm roots are sometimes a rod long; and when the team has hold of it they should, of course, go ahead until every long root is loose, so the boys can gather and get them out of the way rapidly. Now, the team must either back up this distance or turn around and go back, then turn about again. I suggested we pull alongside of a strip of stumps, so that, when the last root was torn loose, the chain could be quickly released, and without moving the team (or going back), wrapped around the stump that happened to be nearest. At the end of the row, turn about; do the same thing back again, or, better still, keep going round and round a "block" of stumps. After overcoming a great many objections to this "new departure" I got men and team to working nicely, and almost expected Mr. B.

to thank me for showing how to save the strength of the team, and his own, while he did almost double the work. When I came round an hour later, however, I heard, before I got in sight, the well-known yells of "Back! back! back!" indicating they had got back on the old plan again. I inquired what the trouble was with the new way, overcame the objections, and got them started right once more; but all day it was the same way. While I was near, every thing went on smoothly with no backing, or almost none; but when I was fairly out of sight they fell back in the same old "rut."

Now, friends, I know this is no new thing. The good wife has it over and over with the hired girl; and not only farmers, but every one who hires help of every kind, has more or less of it. Yes, I know very well that *sometimes* the hired man has the better head of the two, or perhaps knows his own business better than does his employer, but there is a world full of people who can't believe there is any better way than the one their fathers used or that the neighbors all around them use.

Well, during the second day, when Mr. B. was tired out, and the big team was tired out, and tired out, *too*, with so much yelling and "backing" (at least so it seemed to me), I got tired of so much waste of time and strength. Many of the little saplings were but little larger than a good-sized hoe-handle; but the great team must go through with the same program. I asked, as pleasantly as I could, why not work on the plan I had taught him. What do you think was one of his reasons? Why, he said his horses could not *stand it* to keep pulling stumps right along one right after the other.

I replied, "Very good, Mr. B., that may be true; but would it not be better to pull a few and then let the team stand still and rest? There certainly is not much resting for you or them either in backing or turning around every time you pull a sapling that one light horse might pull easily."

To tell the truth, I was getting somewhat provoked by such obstinacy, and *more* provoked by such philosophy. I fear I had forgotten my prayer of the morning, and forgotten, too, the beautiful admonitions in the texts at the head of this talk. Mr. B. was tired and nettled, because he saw my temper was coming up. He replied hotly:

"Well, Mr. Root, if my work doesn't suit you, you pay me off and get somebody else. I have worked very hard, and done the best I know how."

My hand went in my pocket for his money almost involuntarily; for, as a rule, with few exceptions, when a man asks for his pay and says he will quit, there is nothing to do but to pay him off. When my hand got down into my pocket I remembered my money was all left at the house, and I *also* remembered my prayer in the morning.

"Mr. B., it will be a piece of folly for you and me to quarrel now, after we have got along so nicely together. I don't want you to work any harder—in fact, not so hard.

My way is easier for you and for the team. We are almost done with this kind of work; shall we not go on?"

"But, Mr. Root, I have cleared up land all my life. I know how to do it. I don't quarrel with anybody. I worked for one man *ten years*."

"That surely speaks well for both of you; but I have several people now in my employ who have worked for me more than *twenty-five years*. Can't we go on and finish up?"

I was now feeling pleasant. My prayer of the morning had been answered; the Holy Spirit had regained possession of my heart, and had driven out the evil one. It was an easy matter now to laugh him out of his bad mood.

"Well, Mr. Root, if you know how, you take the team and go on," and he handed me the lines. I took them; but the heavy chain soon began to tell on my strength.

"Mr. B., I'll drive, and you *see* if I don't rest the horses; but you will handle the chain, won't you?"

At first he playfully declared it was my job, but finally took hold and worked with a will. Dear brother or sister, whose eyes rest on these pages, do you not see how much better was this kind of ending of a little disagreement?

If I had paid him off as I started to do, and let him take all his tools home (two miles away), and then got some one else to come away out here in the woods to finish a little job, what a piece of folly it would have been! and then, more than all, suppose I had tried to write a Home Paper in keeping with such a course—what would it have been like? and where would I have found texts to justify such a lofty pride, for pride it is, and nothing else, when you pay a man off in this way and let him go?

Since the above incident it has occurred to me that this foolish custom, or, better still, foolish *spirit*, has been, perhaps for ages past, entering, more or less, into the affairs of life. Not many years ago, if a man struck you a blow the world thought there was no honorable way out of it but to strike back, and perhaps fight a duel; and in some parts of Kentucky this is still kept up, until murder keeps following murder. If a man in the heat of passion calls you a "*liar*" you are to strike him down, or *try* to, even if it costs you your life. Where did we get such a code of morals? Surely not from the book where I found the three texts at the head of this talk.

Finally, is it not possible that the real germ and root of all of our labor troubles comes from this readiness, even under slight provocation, to get up on your dignity, and say, "Well, give me my money, and I will get out of your way"? or, "Here is the amount I owe you. I have no use for you any longer"?

Does anybody know how much it is worth in this world to have only kind words (and kind feelings) in parting with every one who has worked for you, even if it be for only a little while? Yes, sometimes we

do have to stoop a little; sometimes it is humbling to our pride; but is it not worth all it costs—nay, ever so much *more* than it costs, to be sure that all who know you have only kindly feelings toward you whenever they may hear your name mentioned? Can it be said of *you*, and said truthfully, "He 'suffers long, and is kind;' he is 'peaceable, easy to be entreated, full of mercy.'"?

DOES IT PAY TO HAVE A BAROMETER?

What, in brief, are the practical advantages of the barometer to hay-harvesters, herders on prairie, and outdoor people in general? Does the instrument forecast falling weather with reasonable accuracy, in your opinion? and usually how many hours, in advance, decided changes—as from dry to wet?

Trinidad, Col.

EDGAR SMITH.

Friend S., the advantages of a barometer to any one engaged in outdoor work, providing he takes a notion to the instrument, and consults it not only daily but several times a day, are almost beyond computation. A captain would no more think of sailing without a barometer than without a clock or compass. The instrument does, as a rule, forecast bad weather with accuracy; but we are usually unable to tell just how long it will be before the weather changes. If it continues to fall, and keeps falling, and the change does not come, you can be pretty sure there will be a fierce storm of wind as well as rain when it does come. In the same way, when it continues to rise, and we keep predicting fair weather that does not come, there is almost sure to be a long spell of nice weather after the storm has passed. One who is not acquainted with the instrument might get impatient, and say it did not amount to any thing. For instance, the women-folks ask me if they will need to carry their umbrellas when going up street. I sometimes reply, "I do not think you will need any thing of the kind. The barometer is running up fast, and the sun will probably be out in an hour or two." Well, the sun comes out, just as I said, but another cloud comes up, and we have what is sometimes called a "wind-up shower." You see, the barometer did not and could not give all these little minutiae of the finishing-up of the bad weather.

Another thing, a falling barometer means wind or rain. A big blow produces exactly the same result as a heavy rain; and no one can tell whether it will be a blow or rain, or *both* blow and rain. A sudden change in the weather from warm to cold or from cold to warm also influences the barometer, and may bring about different results from what we should have if the temperature had remained about the same. All these things must be learned by carefully watching the instrument; and even then no one can tell *exactly* what is going to happen. Sometimes a barometer indicates rain, and we have only a thunder-cloud and every appearance of rain. Still another thing, a thunder-shower a mile or two away will

affect the barometer in your locality. At the time of the tornado in St. Louis our barometer dropped so much that I told the people in our neighborhood that either my machine was broken or there was a tremendous tornado going on somewhere. By the time the papers reached us the barometer had begun to travel back to its usual place, and then I knew the reason of the tremendous drop of the mercury.

Now, lest this should sound very much like an advertisement of the instruments we have for sale, permit me to add that, unless you are going to have time and inclination to watch the instrument closely, and keep it on your mind, it may not pay you to have one. I left one quite a spell with a friend of mine. After several months' use, or perhaps I should say neglect, he said they did not look at it any more at all, because it was "no good." I took it home and hung it up in our "cabin," paying little attention to it, because I supposed it was out of order. Finally, after we had had so many rainy days that I did not have much else to do, I began to watch that neglected instrument; and then I discovered it did its work just as well as my old machine at home, only the field over which the needle traveled was a smaller one. It went up and down in obedience to the changes of the atmosphere, but it moved only a little way up and down. The aneroids are not alike in this respect. Some of them have a good long swing, and others vibrate over comparatively small spaces. By the aid of the barometer we have harvested our crops, both hay and grain, and got them in safely, season after season, while neighbors with no barometer had repeated disasters.

A Warranted Red-clover Queen, 30 cts.

An Offer for New
Subscribers.

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.30 and we will mail you the Bee Journal for a whole year, and also one of our WARRANTED LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We have arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red-clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. They will be mailed in rotation, beginning about June 1st, so "first come, first served."

Headquarters in Chicago for Root's
Bee-supplies at Root's Prices. . . .

A free catalog and a sample of the American
Bee Journal on request.

10 CENTS

That's all it costs to get acquainted with the

Rocky Mountain Bee Journal.

We want to send it on trial to every reader of *Gleanings Three Months for 10 cts.* This vigorous young monthly has just entered its second year on a paying basis, and has become the recognized mouthpiece of the bee-keepers of the great Rocky Mountain alfalfa regions. Address

The Rocky Mountain Bee Journal,
Box 611, Boulder, Colorado.

HONEY QUEENS.—Bred from the Laws strain. Orders being booked for untested and tested queens. Select tested, \$1.50; breeders, \$2.50 to \$5.00. None better. H. C. TRIESCH, JR., Dyer, Ark.

Queens!

Buy them of H. G. Quirin, the largest queen-breeder in the North. The A. I. Root Co. tells us our stock is extra fine. Editor York, of the *American Bee Journal*, says he has good reports from our stock from time to time, while J. L. Gandy, of Humboldt, Neb., has secured over 400 lbs. of honey (mostly comb) from single colonies containing our queens. We have files of testimonials similar to the above.

Our breeders originated from the highest-priced long-tongued red-clover queens in the United States.

Fine queens, promptness, and square dealing have built up our present business, which was established in 1888.

Price of Golden and Leather-colored Queens Before July First.

	1	6	12
Selected Warranted.....	\$1.00	\$5.00	\$9.50
Tested.....	1.50	8.00	15.00

Extra Selected Tested—the best that money can buy.....	4.00		

We guarantee safe arrival to any State, continental island, or any European country. Can fill all orders promptly, as we expect to keep three to five hundred queens on hand ahead of orders. Special price on 50 or 100. Circular free. Send all orders to

Quirin the Queen-breeder,

Post and Money-order Office, Parkertown, Ohio.

TEXAS QUEENS!!

From the Lone Star Apiaries. G. F. Davidson & Son, prop's, have made great preparations for the coming season to accommodate their many customers with either Long-tongue, Imported Stock, or Golden Queens. They have bought out the queen-rearing business of O. P. Hyde & Son, Hutto, Texas, and by buying and increasing their

number of nuclei, they are better prepared than ever to cater to the trade of the bee-keeping public. One of Root's Long-tongue Breeders; Imported Stock direct from Italy; Golden from leading queen breeders. Fine breeders of each of the above have been added to their yards. Safe arrival and satisfaction guaranteed. Send for queen circular and price list. We are now prepared to fill orders for Cyprian and Carniolan queens. Good strains. Address

G. F. Davidson & Son, Box 190, Floresville, Texas.

A VOICE FROM ITALY!

Pure Italian Queens can be supplied at 10 shillings each. Write in English, French, or Italian, and address Malan Bros. (Waldensian Valleys), Luserna San Giovanni, Italy. Our motto: "Do unto others what you would like to be done to you."

Transferring Larvae is Unnecessary if you use the Swarthmore plan of cell-getting. Queens will lay eggs directly in compressed cups. Each cell is quickly removable from outside without smoke, without disturbance to the bees, without opening the hive simply raise the lid and draw them. Order a Grace Cell-compressor and have it on hand—\$2.00 by mail. Queens now ready. Address The Swarthmore Apiaries, Swarthmore, Penn.

HONEY QUEENS!

Laws' Long-tongue Leather Queens.

Laws' Improved Golden Queens.

Laws' Holy Land Queens.

Laws' queens are the standard-bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four apiaries. Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

Italian Queens in the State of Washington

Untested, \$1.00; tested, \$1.50. In June, 25 cts. less for either. I raise all my queens by swarming method. You can't get better queens. Write in time. Address Robert Mirring, Dryad, Lewis County, Washington.

Elkhart Carriage & Harness Manufacturing Co., Elkhart, Ind.

ELECTRIC

Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not sink into the ground; the labor of loading is reduced many times because of the short lift. They are equipped with our famous Electric Steel Wheels, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. Why not get started right by putting in one of these wagons? We make our steel wheels to fit any wagon. Write for the catalog. It is free.

ELECTRIC WHEEL CO., BOX 95, QUINCY, ILL.

"A Gold Mine On Your Farm"

is the title of the most complete and comprehensive illustrated Treatise, on the subject of spraying, with tables of costs and formulae. The result of actual use at the leading Agricultural Experiment Stations, tells of the SPRAMOTOR, the "Gold Medal" machine at the Pan-American. 84 copyrighted pages. We mail it free. Ask for it.

distributing catalogues in your town. Write at once for agents' net prices and our special offer.

MEAD CYCLE CO. Dept. 357M CHICAGO, ILL.

BETTER THAN SPRAYING.

Don't lug barrels of water around when spraying. Use the poison direct. Our

Common Sense Dust Sprayer

and Insect Exterminator is a most ingenious device that is rapidly supplanting the old methods. It blows the finely powdered dust into every nook and crevice. Reaches the bottoms as well as the tops of leaves. Destroy insect life on plants, vines, shrubs and trees. Just as effective for vermin on poultry and pigs. More rapid than spraying. Descriptive circulars and testimonials free.

HILLIS DUST SPRAYER CO., Box 17, ST. JOSEPH, MO.

Advanced Bee Culture

Is a book of nearly 100 pages (the size of the Review) that I wrote and published in 1891; and I will tell you how I gathered the information that it contains.

For 15 years I was a practical bee-keeper, producing tons of both comb and extracted honey; rearing and selling thousands of queens, reading all of the bee books and journals, attending conventions and fairs, visiting bee-keepers, etc., etc. Then I began publishing the Review, and, for several years, each issue was devoted to the discussion of some special topic, the best bee-keepers of the country giving their views and experience. **ADVANCED BEE CULTURE** is really the summing up of these first few years of special-topic numbers of the Review; that is, from a most careful examination of the views of the most progressive men, and a thorough consideration of the same in the light of my experience as a bee-keeper, I have described in plain and simple language what I believe to be the most advanced methods of managing an apiary, for *profit*, from the beginning of the season through the entire year.

A new and revised edition, which includes the improvements of the past ten years, will be out June 1st. It will be as handsome a little book as ever was printed. The paper is heavy extra machine-finished white book, and there will be several colored plates printed on heavy enameled paper. For instance, the one showing a comb badly affected with foul brood will be printed in almost the exact color of an old comb. The cover will be enameled azure, printed in three colors.

Price of the book, 50 cts. The Review for 1902, and the book for only \$1.25. You can send in your order now, and the back numbers of the Review for this year will be sent at once, and, as soon as the book is out, a copy will be mailed you.

W. Z. Hutchinson, Flint, Michigan.
